Contents

Congress Opening Session	1
Urban Political Ecology: Prefigurative Planning for a Climate emergency . . .	1
Planning Istanbul in Hard Times with(out) Great Expectations	1
Keynote Speakers	2
Just Sustainabilities in Policy, Planning and Practice	2
The Paradoxical Potential of Interregnum: Exploring Opportunities for Transformative Planning in Times of Crisis	2
After Green Growth: Satiation As the Strategic Impulse for Spatial Planning	2
The green transition challenge. Social and environmental inequalities in housing	3
Networking Event	4
GPEAN Networking Event: Housing in the Global South –Challenges and Opportunities for Planning Education	4
Roundtable 1	5
CO-CREATING THE 15-MINUTE CITY - (Hosted within track 3: Mobility)	5
Roundtable 2	7
WHAT IS NEW IN COMPARATIVE INTERNATIONAL PLANNING: WHY, WHAT, AND HOW?	7
Roundtable 3	8
Rethinking Democratic Urban Planning: Reflecting on Equitable and Ethical Approaches for the Multi-Crisis Era	8
Roundtable 4	10
Radical alternatives to climate urbanism: towards socially and ecologically just cities	10
Roundtable 5	11
Circularity and/or Sustainability? Imagining Transformative Strategies and Actions for the Urban Transition	11
Roundtable 6	13
Learning through instituting. Impacts of civic action on institutions and the potential for the production of public value in planning	13
Roundtable 7	15
City-Making Beyond Crisis Management: Toward Just Urban Policies	15
Roundtable 8	17

Learning from the social innovation-institution relationship. An ethnographic study in the Veneto Region	475
Exploring the Future of Metropolitan Governance: Metropolitan Management and Regional Development in Decentralized Indonesia	477
Energy Transition and Community Engagement: The case of NSW, Australia	478
Rural Revitalization Beyond Administrative Boundaries: A Case Study of Villages Surrounding Taihu Lake, China	479
Is the polycrisis finally leading to the privatization of risks? Evolving understandings of state responsibilities facing disasters in Italy.	480
Values-driven development? Environmental regulation and planning for development in the UK	481
Participatory Community Planning and Collaborative Governance in the Post-Growth Era: A Case Study of the Nanning Love-U Garden Network in China	482
Zero Net Land Take Policy Mapping: A Multi-Level Analysis in the Context of Italy and Emilia-Romagna	483
The proposed new spatial planning law in Italy: A critical reflection on its structure, content, and objectives in times of crisis	484

Track 5 | ENVIRONMENT AND CLIMATE 487

Geographies of Carbon Trading: Spatial Planning Approaches for Equitable Offset Projects	487
Pursuing climate neutrality through ecosystem services: Evidence from Campania Region, Italy	488
Optimizing Carbon-Neutral Campus Renewal: A Case Study of Xi'an East Station Hub Core Area	489
Between Walls and Water: Stormwater infrastructure, everyday adaptation, and the quest for environmental justice in Mumbai	490
Communities facing floods: risk awareness and climate adaptation strategies in Polish mountains	491
Adapting urban coastlines: strategies and open questions from European regions	492
Through Children's Eyes: Exploring Climate Change and Flood Resilience in Indonesia's Coastal Areas	493
Temporal-Spatial Distribution Characteristics of PM2.5 and Noise in the Under-Viaducts Space	494
An Examination of the Environmental Impacts of Mega Projects on Rural Areas: A Case Study of Two Villages in the South Marmara Region of Turkiye.	495
Linking outdoor particulate pollution to children's negative experiences of their neighborhoods: Findings from an interdisciplinary research project in Ankara	496
Uses and limitations of community participation tools and strategies to create positive energy districts: A literature review	497
Simulsoil: Sustainability-Oriented Soil Planning and Management in Turin's Metropolitan Area	499
Social Movements and Collective Climate Adaptation: The Case of Campo do Bomba, Duque de Caxias-RJ	500
Analyzing heat-related health risks on a local level: Results from a household survey in Dresden and Frankfurt/Main, Germany	501
Addressing Climate Equity Through Community Engagement on Virginia's Eastern Shore	503

In this study, a methodological approach that aims to implement climate neutrality through spatial planning policies is defined and applied. The measure of carbon sequestration (CS) is taken as a reference to estimate the status and evolutionary dynamics of this phenomenon, analyzed and evaluated as associated with the supply of certain types of ecosystem services (ESs), in relation to the reference spatial context. The study is developed as follows. First, the spatial framework of CS is characterized through density maps, utilizing the “Carbon Storage and Sequestration” model of the InVEST suite, which estimates the amount of carbon stored in reference spatial units using raster maps of land cover (Liquete et al., 2015). The model estimates the state of CS, allowing, also, to appreciate its variation over time (Sun et al., 2019). The spatial context addressed by the implementation of the methodology is Campania, an administrative region in southern Italy.

Second, a methodology for characterizing the supply of ESs is identified. The multifunctionality of the supply of ESs can be considered as an analytical reference for the definition of a system of measures oriented to the improvement of CS capacity and, therefore, of the contribution of local spatial planning policies to the effective pursuit of global climate neutrality. Based on previous studies (Isola et al., 2022) and in-depth analyses of environmental, landscape, and socio-cultural contexts, the provision of ESs in relation to the regional territory of Campania is characterized in this study by the following types: preservation of habitat quality levels suitable for sustaining the life cycles of plants and wildlife that can be useful to humans; climate regulation through mitigation of land surface temperature; production of agricultural crops and timber; protection and enhancement of the attractiveness of spatial contexts in relation to nature- and natural resource-based recreational and cultural activities (Zulian et al., 2014); preservation and enhancement of landscape values that ground regional identity.

Finally, the correlations between the spatial taxonomies of CS capacity and ESs supply with regard to the Campania regional context are detected and analyzed, in order to assess how the characteristics and specificities of the multifunctional ESs supply can be effectively used in order to maximize CS capacity, and, thus, the contribution of the Campania region to the improvement of global climate neutrality. The identification of these correlations allows, also, to identify specific recommendations in terms of plan policies in order to improve the quality of life of local societies in Campania.

Optimizing Carbon-Neutral Campus Renewal: A Case Study of Xi'an East Station Hub Core Area

Author: Ting Yang¹

The dual challenges of climate change and environmental degradation place immense pressure on urban environments, making it critical to integrate carbon-neutral strategies into the early stages of planning and design. This study focuses on campus renewal, using the Xi'an East Station Hub Core Area as a pilot to explore innovative approaches for low-carbon, climate-resilient urban design. By leveraging intelligent evaluation platforms, nature-based solutions, and participatory governance structures, this research aims to establish scalable pathways for sustainable urban renewal.

Through the Urban Planning and Design Carbon Neutrality Intelligent Evaluation Platform, real-time assessments of carbon emissions and sinks were conducted, revealing a substantial gap of 100,000 tons CO₂ to achieve carbon neutrality. This shortfall was addressed through a multi-faceted approach combining renewable energy technologies, such as solar panels and ground-source heat pumps, with enhanced green infrastructure and industrial transformation. For example, three-dimensional greening and ecological corridors added 4,100 tons of carbon absorption, while converting 38% of high-density commercial areas into biopharmaceutical clusters reduced emissions by 30,000 tons. These interventions demonstrate how intelligent planning can dynamically balance carbon sources and sinks.
