Several scholars conducted over the last 20 years have examined the variables that affect customers' decisions to buy fair-trade goods (Chatzidakis et al., 2016; Beldad & Hegner, 2018). Customers' inclinations to buy fair-trade products are significantly influenced by their views on these products, societal norms, and moral obligations (Robichaud & Yu, 2021). Moreover, several research investigations highlighted that individuals with heightened environmental awareness tend to prefer purchasing fair-trade and environmentally sustainable products. (Haj-Salem et al., 2022; Kirmani et al., 2022). Furthermore, attitudes are widely acknowledged in the literature on social marketing and cognitive psychology as having a substantial role in determining customers' altruistic and ethical behavior (White et al., 2019). Indeed, several studies examining fair-trade purchasing have found a clear association between consumers' opinions toward fair-trade and their inclination to purchase fair-trade goods (Kossmann & Gomez-Suarez, 2019; Pinna, 2020; Robichaud & Yu, 2021; Shaw & Shiu, 2002; Wang & Chou, 2020). However, these studies didn't consider that individual values strongly impact the attitude and the intention to buy (Rohan, 2000). Previous research has shown that values significantly impact beliefs and attitudes, typically influencing intentions to act in specific ways (Grankvist et al., 2007; Joireman and Duell, 2007). According to Rokeach (1973, p.5), individual values are "enduring beliefs that a specific mode of conduct or end-state of existence is personally or socially preferable to opposite or converse modes of conduct or end-state". Hence, values represent an individual's fundamental principles or overarching beliefs that lead their actions, judgments, and decisions (Rokeach, 1973; Williams, 1979). They encompass directional, cognitive, and affective dimensions, serving as criteria for evaluating behaviors and events (Williams, 1979). However, it's crucial to understand how each individual's values differ in nature and importance (Grankvist et al., 2007). Schwartz (1992) already assumed that individuals have a set of values that shape their lives and establish their preference patterns. According to Schwartz (1992), 56 value elements correspond to ten distinct metavalues: achievement, power, hedonism, self-direction, stimulation, security, conformity, tradition, benevolence, and universalism. These ten metavalues are arranged in a circular pattern consistent with the Schwartz value theory (1992), where values that correlate positively are closer or next to one another, while values that correlate negatively are farther away or opposite. According to Jimenez et al. (2020), the most often used value scale in contemporary human/individual values research is the Schwartz Value Theory (SVT).

By identifying the wants and desires of customers, an understanding of their values may improve the effectiveness of marketing. A multitude of nations, including Belgium, the US, Sweden, Greece, the UK, and Spain, have carried out substantial studies on personal values and socially conscious consumption (Steenhaut and Kenhove, 2006; Grankvist et al., 2007; Krystallis et al., 2008; Pepper et al., 2009). In Italy, there is a lack of studies considering the individual values' impact on fair-trade purchasing intention. Thus, it could be fascinating to understand how the individual values of Italian consumers impact their decision to purchase fair-trade products.

Purpose of the paper. The research aims to delve into the individual values of Italian consumers and how these values influence their decision-making process when purchasing fair-trade products. This investigation arises within the framework of fair-trade principles, emphasizing equitable treatment, fair compensation, safe working conditions, and environmental sustainability.

This study addresses a gap in the existing literature by narrowing its focus to Italian consumers and their value systems. Focusing on Italian consumers, the research aims to provide insights into the unique factors driving their intention to buy fair-trade. Thus, through an in-depth analysis of Italian consumers' values, attitudes, and behaviors, this research aims to uncover the underlying motivations behind their fair-trade purchasing decisions. Specifically, it will explore how individual values shape consumers' preferences and actions in the fair-trade marketplace. Accordingly, the research question of this work is:

RQ. How do individual values influence the purchase intentions of fair-trade products among Italian consumers?

Methodology. To fulfill the aim of this study and address the research question posed, a survey will be conducted. The survey will be developed from sources already used and validated in the literature (Tobón & Luna-Nemecio, 2021). The advantage of relying on already validated sources increases the possibility of obtaining a reliable and valid questionnaire (Sürücü & Maslakçı, 2020).

The survey will be divided into three sections. The first section will measure the ten individual values defined by Schwartz's model to determine how relevant each value is to respondents. To carry out this measurement, the 21-item PVQ of Schwartz will be used. This tool is widely used and accepted in the literature to predict the attitudes and behaviors of individuals (Jimenez et al., 2020). The importance of the values will be rated on a Likert scale between 1 and 7. One indicates "not at all like me", and seven indicates "very similar to me".

The second section will collect data about the purchase intention of fair-trade products. The first part of this section will provide respondents with a brief definition of these products. In particular, a fair-trade business relationship is one in which employees receive a fair salary, labor is performed in hygienic and safe circumstances, and environmental protection is prioritized. (Binion, 2020). Haj-Salem et al.' adapted scale (2022) will be used to measure intention to purchase fair-trade products, while items evaluating attitudes about fair-trade products will be produced based on Zerbini et al. (2019). Using a seven-point Likert-type scale, (1) = strongly disagree and (7) = strongly agree, these scales will be tested. Finally, in the third section, demographic and socioeconomic information such as age, gender, education, occupation, and income level will be collected.

The two-step data analysis method proposed by Anderson and Gerbing (1988) will be used. To determine the personal values (meta-values), an exploratory factor analysis (EFA) will be conducted in the first stage on the ten Schwartz values derived from the answers to the portrait values questionnaire (PVQ); in the second stage, a confirmatory factor analysis

(CFA) will be conducted to evaluate the psychometric qualities of the scales. Lastly, multiple regression analysis will be performed to ascertain the connections between certain cultural values and the intention to buy fair-trade goods.

Additionally, respondents will be advised that all of their answers are anonymous and confidential, and they are urged to provide as truthful an answer as possible. We'll send emails and post links to the poll on social media. This strategy may assist in guaranteeing respondents' anonymity and lowering social disability prejudice based on a convenience sample (Ming et al., 2021).

Expected Results. Understanding in depth how Schwartz's values may help understanding how consumers develop their purchase intention, and what are the factors that organizations can use to facilitate the emergence of the intention and the translation of the intention into action. The use of fair-trade products is important in a world where attention to the environment, sustainability, and the well-being of individuals has become crucial in addressing current global challenges. In the context of growing environmental and social awareness, consumers are increasingly taking an active role in reducing the environmental impact of their consumption choices and supporting ethical business practices (Busalim et al., 2022). As identified by Schwartz's value theory, individual values guide people's preferences, decisions, and behaviors in various contexts, including consumption. These values reflect an individual's fundamental beliefs about what is essential in life and influence perceptions of the world and actions taken (Schwartz & Bilsky, 1990).

As observed by other scholars in contexts related to the purchase of green, sustainable products and taking into account the conditions of workers, it is expected to observe a positive correlation between specific individual values of participants and their propensity to purchase fair-trade goods (Haj-Salem, 2024; Shaver & Yan, 2022; Li et al., 2021). Consumers who give more importance to ethical and social values, such as equality, benevolence, and universalism, may be more inclined toward issues related to social justice and environmental sustainability (Sarid & Goldman, 2021). This inclination should drive individuals toward purchasing products that adhere to these principles. Furthermore, it is expected that consumers who find an alignment between their values and the fair-trade products principles will be more likely to use them, even if the price is higher (Musa & Gopalakrishna, 2021). On the other hand, it is also expected to encounter notable variations between demographic categories and individual values' influence on consumer intentions. For instance, purchasing habits may differ based on age, income, education, and cultural background.

Higher-educated people or those from more environmentally conscious cultural origins may indicate a greater inclination to buy fair-trade goods than people from other backgrounds (Berki-Kiss & Menrad, 2022).

Since the degree of knowledge and instruction about sustainability and fairness themes strongly impact how individual beliefs affect consumer behaviors (Hosta & Zabkar, 2021), a better-informed customer about fair-trade and production concerns may be more inclined to act responsibly while purchasing.

However, discrepancies between expressed values and customers' purchase patterns may arise, among other outcomes. For instance, a customer may claim to support social justice and the environment, but at the moment of purchase, they may be swayed by other considerations like availability or price. This could cause a distance between expressed intentions and practical actions.

Finally, this research will deeply understand how consumers' individual beliefs impact their attitudes and intentions to buy fair-trade products.

Research limitations. Despite the interesting possible results of the study regarding the relationship between individual values and intention to buy and purchase fair-trade products, it could still suffer from several limitations. First, the survey may not have a representative sample of the Italian population, which could influence the results. Also, undermining the validity of the work could be responses provided by participants influenced by many factors, such as a desire to provide socially acceptable answers or a lack of awareness of their cultural values. Consider also that the study will adopt a cross-sectional perspective and not a longitudinal perspective so data will be collected at a given time. Furthermore, the results obtained will be specific to the Italian context and may not be generalizable to other populations or cultural contexts, limiting the applicability of the research findings. For these reasons, future studies should consider these limitations and possibly increase the reference sample and replicate the analysis in other countries to improve the generalizability of the results.

Managerial implications. Understanding the impact of consumers' individual values on the intention to buy fair-trade products and the purchase of these products could be helpful to several subjects. A comprehensive analysis of the correlation between individual cultural values and inclinations towards fair-trade products may shed lights on the factors affecting consumers' intentions and help promoting products in the most effective way. This knowledge can increase the significance of multicultural marketing tactics, which mostly consider country or collective culture, with the weak assumption of a direct influence of it on consumers' individual choices and behaviors. Researchers can forecast people's attitudes and behavior by identifying the values that are significant to them (Kamakura and Novak, 1992). This knowledge could be particularly useful in the fair-trade business, as marketers may achieve a competitive edge by offering fair-trade products (Strong, 1997). These findings' practical uses would be in marketing campaigns, as companies are better able to spark interest in their goods when they are aware of the values of their customers (Durgee et al., 1996). Since customers use values to guide their purchasing decisions, marketers should use this knowledge to shape their communications better (Allen, 2001; Blackwell et al., 2001). Therefore, by understanding the impact of individual values on fair-trade purchase intention, marketers can customize their messaging and positioning better to align with these values.

The study's results can also guide product development efforts within fair-trade organizations. Understanding what values are most important to consumers can help develop new fair-trade products that align with these values. For

example, consider environmental sustainability critical to fair-trade consumers' purchase intentions. In that case, organizations can focus on developing environmentally friendly packaging or expanding the range of environmentally sustainable products. Moreover, there are important implications also for NGOs engaged in fair-trade programs. These organizations can improve their outreach and advocacy activities by utilizing the knowledge gathered from this research. Thus, NGOs can effectively communicate the social and environmental benefits of fair-trade practices by customizing their communication tactics based on an understanding of the specific values that influence the purchasing intentions of Italian consumers toward fair-trade products.

On the other hand, this study could be helpful for policymakers. Examining cultural values and fair-trade purchase trends may help policymakers shape initiatives to highlight the importance of buying these products.

Governments may play a critical role in encouraging ethical consumerism through subsidies, tax incentives, or regulatory frameworks encouraging fair-trade practices and environmental sustainability.

Moreover, governments may foster an environment that encourages firms to adopt responsible practices and empowers consumers to make conscious decisions by coordinating legislative objectives with cultural values and consumer preferences. To sum up, a comprehensive examination of individual cultural values and fair-trade consumption may educate various stakeholders, such as governments, corporations, and marketers.

Originality of the paper. The originality of this paper lies in its focus on understanding how individual values influence the purchase intentions of fair-trade products among Italian consumers. While previous research has extensively explored factors influencing fair-trade consumption, such as attitudes, societal norms, and environmental awareness, few studies have considered the effects of individual values on consumer behavior in the fair-trade context (Robichaud & Yu, 2021; Zerbini et al., 2019; O'Connor et al., 2017). Although environmental awareness has been identified as a significant factor driving fair-trade consumption, the influence of individual values, such as personal beliefs and overarching principles, has been largely overlooked (Haj-Salem et al., 2022; Kirmani et al., 2022; Konuk, 2019). By focusing on individual values, this paper aims to fill a gap in the existing literature and provide insights into the underlying motivations behind Italian consumers' fair-trade purchasing decisions. It recognizes the importance of understanding consumer values in enhancing marketing efficacy and tailoring strategies to meet consumer needs and desires (Shaw et al., 2005; Grankvist et al., 2007).

Furthermore, even while studies on personal values and socially conscious consumption have been carried out in several nations, in Italy there is a lack of studies that intensely focus on the individual values' impact on the intention of purchasing FT products. Therefore, this paper offers a novel perspective by exploring how Italian consumers' individual values impact their fair-trade purchasing behavior, contributing to a deeper understanding of fair-trade consumption patterns within the Italian context. In conclusion, this study aims to fill this research gap and offer insightful results that might improve customized marketing plans and encourage moral and sustainable consumer behavior in the Italian market.

The story that only circular products can tell: Empowering consumers through background information

SHRIPATHY SWAMINATHAN¹ VINICIO DI IORIO² FRANCESCO TESTA³

Abstract

Used clothes have a story to tell, carrying with them the essence of their previous lives. Whether second-hand or remanufactured, clothes passed down from someone else entail something special, embodying not just a product, but a narrative. Literature suggests the need for more value-based studies on consumer behavior, such as satisfaction and perceived quality, especially in the post-purchase stage of circular economy products. One less-explored value-based attribute is the concept of provenance, where the impact of the prior owner of an item remains largely unexplored. Hence, the primary objective of this study is to analyze the impact of provenance effect on consumers' purchase intentions, focusing on its inherent value in used clothing, such as remanufactured or second-hand products. To study these effects, two between-subject experiments were conducted in consecutive years. The first part looked at how product circularity and provenance interact with the presence of blockchain technology. The second part, inspired by the initial findings, focused solely on the relationship between product circularity and the provenance effect. Our analysis from both studies offers insights into consumer purchase intentions and how they perceive the value of circular products. Through the insights gained, this study aims to provide guidance for developing a new strategy to enhance the longevity and circularity of used products in the market.

Keywords: *circular economy; sustainable consumption; fast fashion; provenance effect; consumer purchase intention; second-hand products*

Framing of the research. *Over the years, there has been a growing focus on the Circular Economy as a solution to replace the linear consumption model. However, with each market advancement comes new challenges. Despite progress in technology and economic production, consumption rates have paradoxically increased, particularly evident in the fast fashion phenomenon, doubling the industry's size in the past decade. Various solutions have been proposed, but more consumer focused strategies are needed to achieve sustainability goals. This study addresses the need for value-based solutions to enhance circularity, especially on the consumer side. It ventures into the heart of the circular economy, pivoting from the traditional emphasis on technical qualities such as material composition and product durability (Machado et al., 2019; Testa et al., 2021) to explore the profound, intangible aspects imbued within circular goods. Highlighting the unique value propositions that Kirchherr, Reike, & Hekkert (2017) noted, it investigates the environmental benefits, the influence of brand image (Kim & Jang, 2016), the power of product history, and the innovative transparency offered by blockchain technology (Morkunas et al., 2019). Through recognizing the regenerative nature of circular products, the study delves into how various elements—including brand recognition, perceived uniqueness (Tian et al., 2001; Franke & Schreier, 2008), meaningfulness (Im et al., 2013), and the stories of previous ownership—inform consumer preferences and purchase intentions. Drawing on insights from Confente, Scarpi, & Russo (2020) and Magnier, Mugge, & Schoormans (2019), it seeks to elucidate the complex motivations that draw consumers towards circular products, proposing hypotheses on the profound impacts of product type (remanufactured vs. second-hand) and the depth of information available on consumer perceptions and intentions.*

Purpose of the paper. *The primary objective of this study is to transcend the conventional linear model of consumption and facilitate the transition towards circularity within the fast-growing market. While extant research predominantly delves into the production facet to promote circularity, it's time to spin the wheel towards exploring the consumption side of the cycle. Recognizing consumers as pivotal actors, we have undertaken to delve into the multifaceted motivations underpinning consumption decisions of emotion-valuing primates. The subsequent paragraphs delineate and explains the chosen parameters of this study, contextualized within existing relevant scholarly discourse.*

Beyond technical aspects of circular products

The circular economy promotes the principles of reducing, reusing, recycling, and recovering materials in both production and consumption processes to minimize environmental harm (Kirchherr, Reike, & Hekkert, 2017). In essence, the regenerative approach of the circular economy posits that items that are repurposed or recycled offer unique value propositions to consumers. While some studies have delved into what drives consumer interest in such products (Confente, Scarpi, & Russo, 2020; Magnier, Mugge, & Schoormans, 2019; Testa, Gusmerotti, Corsini, & Bartoletti, 2022), the focus has predominantly been on their perceived technical qualities, including the composition of materials, perceived quality, and attractiveness (Machado, Almeida, Bollick, & Bragagnolo, 2019; Testa, Di Iorio, Cerri, & Pretner, 2021). For example, recent findings suggest that while consumers highly value and are inclined to buy second-hand items made from recycled plastics, concerns about plastic reduce the perceived value of these products (Testa et al., 2022). There is an ongoing interest in researching second-hand products, particularly those of well-known brands (De Angelis et al., 2017; Testa et al., 2022), as a brand embodies the beliefs and perceptions that significantly influence consumer behavior (Kim & Jang, 2016). Specifically, a favorable brand image can motivate consumers to prefer its products or services over those of competitors, even if the products are constructed from recycled materials (Testa et al., 2022). However, the effect on final purchasing decision of products entailing different types of regenerative approaches is yet to be assessed.

H1: The type of circular product (remanufactured vs. second-hand) has a significant positive effect on consumers' purchase intention.

Uniqueness, meaningfulness, and purchase intention of circular products: uncharted waters

The decision-making process of consumers is swayed by deeper, non-tangible elements such as uniqueness and meaningfulness. Recognizing their role in shaping purchase intentions can enable companies to fine-tune their marketing approaches and product line-ups. Uniqueness pertains to how a product or service stands out; it is defined as "the extent to which a consumer perceives a product as being distinct from others in the same category" (Tian et al. 2001, p.95). Studies on perceived uniqueness in tailor-made products suggest that beyond just aesthetic and functional suitability, perceived uniqueness adds distinctly to the utility experienced by customers, particularly for those seeking a sense of uniqueness (Franke & Schreier, 2008). Additionally, Hagtvæd and Patrick (2008) demonstrated that products perceived as unique could elevate their perceived value and spur greater purchase intent. Their findings indicated that between two options, consumers showed a preference for the unique item over the commonplace one, even at a higher cost, underscoring uniqueness as a potent strategy for product differentiation and enhancing purchase intentions.

Meaningfulness, on the other hand, relates to how personally significant or relevant a product feels to a consumer in terms of its suitability and utility (Im et al., 2013). Research into meaningfulness suggests that creating distinction through meaningfulness leads to higher customer satisfaction, as products that are more meaningful more effectively meet consumers' needs and expectations (Im and Workman, 2004; Kim et al., 2013). Further studies into the role of consumption-supportive packaging functionality indicate that perceived product meaningfulness is a key factor in understanding its positive influence on purchase intention (Im et al., 2013). Therefore, products that strike a chord of both uniqueness and meaningfulness with consumers are seen as more valuable and fulfilling, increasing the likelihood of purchase. Yet, the academic community has not extensively explored these aspects in the context of circular products, including both second-hand and remanufactured items.

H2: The type of circular product (remanufactured vs. second-hand) has a significant positive effect on meaningfulness and uniqueness.

Leveraging blockchain technology to securing product's information

Conveying information to the final consumer is a delicate endeavor. Akin to a drug prescription, its effectiveness largely depends on providing the right amount of information and trust towards such information. Regarding the former aspect, literature is adamant in highlighting the risk of information overload (Gross, 2014; Hu and Krishen, 2019). On the other hand, trust is much more subtle and challenging to convey effectively, as much as requiring third-party, independent certifications (Testa et al., 2020). Especially when dealing with sustainable, circular products, the risk of greenwashing looms on the horizon (Garrido et al., 2020). Therefore, companies strive to catch up with the latest technology to show accountable information. Blockchain technology (BT) serves this purpose admirably. Specifically, high-end companies, whose products' value comes primarily from the unseen—such as the quality of the materials involved, the craftsmanship, etc.—are secured and then provided through a specific product ID (Morkunas et al., 2019). An example of this is how LVMH, Prada, and Cartier (part of Richemont) have collaborated to create the Aura Blockchain Consortium, a global luxury blockchain initiative designed to enhance transparency and traceability for luxury items. This platform matches product IDs with client IDs, allowing consumers to access a product's history and proof of authenticity at every step of its lifecycle. Brands like Hublot, Bvlgari, and Louis Vuitton are already active on Aura, each developing unique experiences tailored to their products and customer expectations, while ensuring the highest standards of data privacy and security (LVMH, 2021). Nonetheless, background information might be relevant even when purchasing second-hand or remanufactured products (Kessous et al., 2019). Specifically, its benefits are twofold: pragmatic and emotional. The former refers to concerns over scams, so it can mitigate scams and connect the past and next owner in a sort of intelligible human bond, the value of which, though, remains largely unexplored.

H3a: The encryption of owner information using blockchain technology can affect the perceived meaningfulness and uniqueness of circular clothing.

H3b: The encryption of owner information using blockchain technology can have a significant positive effect on consumers' purchase intention.

Uncovering the hidden value of used products

It is somewhat unexpected that research has yet to delve into a unique characteristic of handcrafted items that are neither remade nor recycled: the history of their previous ownership. Apart from technical attributes, there's a compelling case to be made that a product's backstory—its provenance—might influence its perceived worth. The significance of provenance is well-acknowledged in the realm of antiques and artwork purchases, as outlined by Feigenbaum and others (2012). Typically, such items accrue value through their historical lineage and the narratives of their past owners. Yet, the impact of provenance on more everyday consumer goods remains ambiguous. Conventional wisdom often posits that resale items depreciate in value. However, preliminary findings suggest that even ordinary products can appreciate in value, as observed in studies of the secondary sneaker market (Slaton & Pookulangara, 2022). This inconsistency within scholarly discussions warrants further exploration. We posit that an underappreciated aspect lending significance to remanufactured goods is the story of their origin—essentially, the narrative of provenance they carry. Storytelling is a fundamental human experience that adds perceived value to objects. Thus, we investigate the intrinsic value circular products may hold, focusing on items with a history of previous ownership, including both second-hand and remanufactured goods. These items have been part of someone else's life—worn, experienced, and imbued with personal memories. In essence, they bear a connection that extends beyond the physical, crafting a personal narrative. Our research then is dedicated to revealing the intrinsic worth embedded in pre-owned apparel.

H4a: Information about the provenance of a product, specifically the status of the previous owner, significantly affects consumers' purchase intentions when purchasing circular products.

H4b: Only specific types of provenance information, relating to the previous owner's altruism or self-centeredness, influence the perceived value and purchase intention of circular products.

Methodology. *Through a funnel process, we designed two key studies to test our hypotheses. Study 1 focuses on a broad, cross-country sample of respondents, covering more generic aspects related to second-hand products, blockchain technology (BT), and the provenance effect, over a few dependent variables such as meaningfulness, uniqueness, and eventually purchase intention. Study 2 delves into background information by exploring on a smaller yet still cross-country scale, different connotations of this kind of information over the same dependent variables.*

Study 1

Setup

The main purpose of Study 1 was to examine how the embedded value of circular clothing influences consumers' purchase intention when the owner's information is encrypted using blockchain technology. In order to do so, we employed a cross-sectional design by conducting a 3x2 between-subject experiment with different information settings. We used a three-factor design: Factor 1 focused on status provenance (socialite v/s no-frills previous owner), Factor 2 on the type of circular product (remanufactured v/s second-hand), and Factor 3 on the blockchain technology (encrypted v/s no encrypted information). Each factor was manipulated using two similar short vignettes featuring a simple scarf but with distinct information. Thus, six different information settings were presented based on the factors considered. Participants were randomly assigned to one of the scenarios, and their responses were observed. To ensure the study's robustness, each treatment was assigned to a comparable number of respondents in a proportional manner.

3.1.2 Variables and data collection instruments

A multi-section survey served as the data collection instrument, initially gathering respondents' demographic data and general information about their clothing purchases. Tailored to the specific experiment shown, the survey included four different questions for assessing the manipulation conducted in the experiment. It followed sections with items related to uniqueness (Franke & Schreier, 2008), meaningfulness (Vogt, Jenny, & Bauer, 2013), and purchase intention (Chen & Chang, 2013). Respondents rated these statements on a 5-point Likert scale for agreement. All items were adapted to suit the study's purpose.

3.1.3 Sample

The sample population consists of consumers from five European countries: France, Germany, Italy, Poland, and Spain. Administered in January 2022, the survey was conducted through an independent online survey company to minimize sampling errors and reach a broader respondent base. The survey targeted pre-registered users on the platform, inviting them based on established socio-demographic quotas and meeting initial filters. Invitations were sent via email, providing participants with a link to the online platform for questionnaire completion. The compilation process included automatic checks to prevent missing, inconsistent, low-quality, or suspiciously rapid responses, potentially from bots. Respondents received incentives in the form of accumulated points, which can later be converted into digital rewards. At the end, we received 5124 complete responses as our random sample considered in this study. Table 1 represents the descriptive details of the sample population.

Study 2 Setup

The purpose of Study 2 was to validate, endorse, and explore more on the results obtained from Study 1. With respect to the results of study 1, study 2 was designed focusing specifically on the first two factors namely, type of circularity and status provenance. A slight modification was made to the presentation of Factor 1, which now specifically centers on comparing altruistic and self-centered previous owner (status provenance). Factor 2 remains unchanged, focusing on comparing the remanufactured and second-hand (type of circular product). The rest of the experimental setup remained consistent.

Variables and data collection instruments

Similar to Study 1, a multi-section survey was employed to gather necessary data. In addition to the variables from Study 1—uniqueness (Franke & Schreier, 2008), meaningfulness (Vogt, Jenny, & Bauer, 2013), and purchase intention (Chen & Chang, 2013)—three additional sections were included. These new sections covered word of mouth (Skarmeas, D., & Leonidou, C. N., 2013), perceived quality (Yoo, B., & Donthu, N., 2001), and consumer's intention to examine the property (Di Iorio et al., 2023). Furthermore, manipulations were verified with respective checks. Respondents rated these statements on a 5-point Likert scale for agreement, with all items adapted to suit the study's purpose.

Sample

Following the same protocols, Study 2 was conducted in January 2023 with random samples from Germany and Italy. We received a total of 2046 complete responses, with 1027 from Germany and 1019 from Italy. Table 2 provides descriptive details about the sample population.

Results

Study 1 Results

As a first step, manipulation checks were conducted to verify the obtained sample. A contingency table was formed with respect to the manipulation check questions and each of the experiments and ANOVA was performed. The ANOVA results ($p < 0.00$) showed significant differences among the levels of the experiment factor. Hence, it appears to be effective in distinguishing between the experimental conditions.

Following the manipulation check, a series of validations are performed on the obtained sample in order to proceed with the factorial analysis. It included Bartlett's Sphericity Test to check the correlation between variables for factorial analysis ($p\text{-value} < 0.05$), Kaiser-Meyer-Olkin Test to evaluate the data suitability (overall MSA 0.97), Cronbach's alpha to measure the internal consistency reliability ($\alpha = 0.953$), Composite Reliability to evaluate the reliability of latent constructs (0.95), and finally, VIF to measure the multicollinearity among the considered variables (< 5) (Tabachnick & Fidell, 2007). Based on the results obtained, the data were clearly suitable for factor analysis. In general, the factor loadings ranged from 0.75 to 0.93 which is above the required threshold of 0.6 (Field, 2009; Yong, A. G., & Pearce, S., 2013) and their Cronbach alpha above 0.9.

Further, with respect to the latent constructs of the study, a model was created for Confirmatory Factorial Analysis. The fit of the model was verified which provided significant results to conclude ($CFI=0.981$, $TLI=0.978$, $RMSEA=0.048$). Table 3 represents the CFA results of the fitted model.

*M = Meaningfulness, U = Uniqueness, pi & pint = Purchase Intention

As the final step, Ordinal Logistic Regression was performed to understand the influence and interaction of the considered variables. Table 3 shows that the model fits well for purchase intention and uniqueness, but only Lipsitz test results are significant for meaningfulness. Table 4 displays the Pseudo R-square since R-square isn't applicable in OLR. Table 5 presents parameter estimates, crucial for understanding the association between variables. The type of circular

product is significant for meaningfulness ($p < 0.00$), uniqueness ($p < 0.001$), and purchase intention ($p < 0.00$). Status provenance is significant only for purchase intention ($p < 0.00$), while blockchain encryption isn't significant for any variables. However, the interaction term of provenance and type of circularity is significant for all response variables: purchase intention ($p < 0.03$), meaningfulness ($p < 0.03$), and uniqueness ($p < 0.005$).

Considering the control variables of study 1, among the different countries, Spain, Italy, and Poland show significance with all three response variables, while France is significant only for uniqueness. Gender and Education level are significant only for meaningfulness. The presence of senior family members isn't significant, but the presence of junior members is significant for all response variables.

To summarize the obtained results, the findings of the study imply that secondhand products and status provenance relates to higher purchase intention among the consumers. Secondhand products entail higher perceived values among

consumers in terms of both meaningfulness and uniqueness, no matter the provenance status. Meanwhile, the third factor of the study - encryption using blockchain technology - seems to have no impact in any of the attributes. Interestingly, results obtained from the interaction terms reveal that the customers' purchase intention and the perceived uniqueness and meaningfulness of the circular product depends on both the type of circular product as well as the provenance information shared.

Study 2 Results

Similar to study 1, ANOVA was performed for manipulation check which provided effective ($p < 0.00$). Following the manipulation check, a series of validations were performed including Bartlett's Sphericity Test to check the correlation between variables for factorial analysis (p -value < 0.00), Kaiser-Meyer-Olkin Test to evaluate the data suitability (overall MSA 0.97), Cronbach's alpha to measure the internal consistency reliability ($\alpha = 0.971$), Composite Reliability to evaluate the reliability of latent constructs (0.97), and finally, VIF to measure the multicollinearity among the considered variables (< 5). As the results were positive, an exploratory factorial analysis was performed on the considered items resulting in factor loadings ranging from 0.6 to 1 above the required threshold of 0.6 (Field, 2009; Yong, A. G., & Pearce, S., 2013). Further, with respect to the latent constructs of the study, a model was created for Confirmatory Factorial Analysis. The fit of the model was verified which provided significant results to conclude (CFI=0.958, TLI=0.953, RMSEA=0.062). Table 7 represents the CFA results of the fitted model.

Ultimately, Ordinal Logistic Regression was performed on the study model. Similar to study 1, tests to understand the model fit and to obtain their Pseudo R Square values were performed and represented in Table 8 and 9 respectively. Finally, the estimate values to understand the relationship between the response and explanatory variables are highlighted in Table 10.

Confirming the results of study 1, study 2 also proves that the type of circular product factor is statistically significant with meaningfulness ($p < 0.00$), uniqueness ($p < 0.001$), and purchase intention ($p < 0.00$). Contrastingly, status provenance factor showed no significant effects. In addition, the interaction between these factors was also not significant. Considering the control variables of the study, gender showed significance to purchase intention and uniqueness but not for meaningfulness. Age group is strongly related only to meaningfulness. Similarly, family size has strong significance in purchase intention but with less impact on meaningfulness and uniqueness. The presence of minors in the family shows significance with purchase intention and uniqueness. Lastly, respondent's income level has a strong relationship with all the response variables.

The findings of this study support that the purchase intention of consumers and its perceived meaningfulness is influenced by circularity of the product. But it fails to support the main hypotheses regarding the influence of provenance effect on consumer's purchase intention. Further, there is no other influence in the perceived meaningfulness and uniqueness.

Table 11: Summary of hypotheses and results

Hypotheses	Results
H1: The type of circular product (remanufactured vs. second-hand) has a significant positive effect on consumers' purchase intention.	Supported
H2: The type of circular product (remanufactured vs. second-hand) has a significant positive effect on meaningfulness and uniqueness.	Supported
H3a: The encryption of owner information using blockchain technology can affect the perceived meaningfulness and uniqueness of circular clothing.	Not supported
H3b: The encryption of owner information using blockchain technology can have a significant positive effect on consumers' purchase intention.	Not supported
H4a: Information about the provenance of a product, specifically the status of the previous owner, significantly affects consumers' purchase intentions when purchasing circular products.	Supported
H4b: Only specific types of provenance information, relating to the previous owner's altruism or self-centeredness, influence the perceived value and purchase intention of circular products.	Not supported

Research limitations. *It's interesting that we obtained two contrasting results by using the same experimental setup. In the first study, adding provenance information to second-hand circular products was impactful. However, when provenance details were limited to selfishness and altruism in study 2, there was no effect. This contrasting results rises two questions: Does only a specific type of provenance information influence buying intentions? And if so, what kind of provenance information is effective? Thus, we need more clarity on the results obtained, which further opens up the path for future research direction in this field.*

Furthermore, in both studies, circular products were inherently viewed as unique and meaningful by consumers. This suggests that circular products have inherent value for consumers. Adding previous owner information can enhance perceived meaningfulness and uniqueness of the circular product. However, considering the results from study 2, the specific type of ownership information that can have a significant relationship remains unanswered. Hence, future research should focus on these aspects while considering the intangible values of the products studied.

Managerial implications. *For practitioners, the knowledge that circular products contain superior value can be a valuable marketing tool. Especially for second-hand market and its business players, it can directly help in boosting their sales and business by incorporating provenance information in their marketing strategy. Besides private reselling markets, companies can appeal to consumers who are looking for more sustainable and ethical purchasing options by promoting the fact that their products have been re-crafted. This can help companies differentiate themselves in the market and attract consumers by providing them with products with greater meaning and value. Furthermore, this study also suggests that companies may benefit from investing in the development of new business models that emphasize the value of remanufactured and reused products. By adopting circular business models, companies can capture more value from their products and create new revenue streams, while also contributing to a more sustainable economy.*

Originality of the paper. *Our attempt to explore the provenance of used products in terms of circularity is novel, yet further studies focusing on this aspect are necessary for a better understanding. Previous research on provenance mainly focuses on the origin of raw materials and production processes, involving people (B. Luceri et al., 2016, M. Spence et al., 2018, SK. Prathap et al., 2022). Yet, there hasn't been any research on provenance concerning previous ownership and its link to circular products. To our knowledge, this is the first study to investigate how provenance, product circularity, and their perceived values are interconnected.*

Reshaping customers' lifelong journey in the health and wellness contexts

LAURA GRAZZINI¹ SABINA DE ROSIS² RAFFAELE FRUSTACI³ VALENTINA SBROLLI⁴
GAETANO AIELLO⁵

Abstract

Nowadays, the boundaries between healthcare and wellness are blurring, leading to a convergence phenomenon across these industries. While previous works mainly focused on the convergence between healthcare and technology, this study aims to integrate this perspective, including the wellness domain. In doing so, the present research will focus on the consumer point of view, trying to identify the actual journey across the health and wellness industries. In order to understand the structure and the touchpoints of this path, we will conduct a focus group involving healthcare and wellness consumers. Theoretically, the study contributes to the existing literature by exploring this new scenario of convergence. From a managerial standpoint, the research provides guidelines for companies within healthcare and wellness industries, supporting them in building strategies funded on consumer behavior knowledge.

Key words: health, wellness, convergence, lifelong journey, touchpoints

Framing of the research. Health and Wellness are two industries typically considered as two separate entities (Greenberg, 1985). However, several changes, both from the demand and offer side, are reshaping the current scenario towards a single widespread sector where boundaries are blurred. In 2022, in Italy, healthcare expenditure amounted to 171.9 billion Euros, with private expenditure accounting for 21% and steadily increasing over the past ten years (ISTAT, 2023). Between 2010 and 2017, the healthcare system experienced a depletion in staff, number of hospitals, and beds, leading to increased reliance on partnerships with the private healthcare sector (Buzelli & Boyce, 2021). In this scenario, there is also a constantly growing wellness market worth \$5.6 trillion globally (GWI, 2023), with Italy ranking fourth among European countries in market size in 2020 (GWI, 2021). Consumers move within the health and wellness sectors to balance their lives and achieve their optimal selves by taking care of themselves in intangible ways as well (Grénman et al., 2019).

From Patients to Customers

From the demand point of view, integration can be examined through the lens of consumer behavior, a consumer who is increasingly informed and aware of health, wellness and well-being (McKinsey, 2021). Nowadays consumers are more conscious and sensitive about their health-related issues (Rathna & Sumathy 2022) and this pushes them towards the adoption of healthy behaviors and towards the search for diet, exercise, better sleep and energy levels and stress management (KPMG, 2018). Indeed, today, an increasingly large percentage of individuals pay great attention to health and wellness (Suleman, 2021), leading to the development of a more holistic approach to medicine (Global Wellness Summit, 2021). The traditional notion of the passive patient is thus replaced with that of a health and well-being consumer involved and proactive in the design and management of his or her own care (Crié & Chebat, 2013), in fact it should be considered just as an individual, in line with the person-centered approach, that views body systems as interrelated (Starfield, 2011) and implies a focus on the totality of the person, considering the human-being rather than the patient (De Maeseneer, 2012).

This new, more involved and empowered consumer adopts a behavior that is expressed on three fronts: 1) self-monitoring, also using new digital tools (François et al., 2023); 2) healthy habits, as avoid smoking, eat well or exercise

(Anderson, 2019); 3) shared decision-making process, through which the individual becomes involved in choices that affect his or her state of well-being (Stiggelbout, 2012). This is also confirmed by Zhao (2016), who states that the individual should be involved in every decision or behavior that affects his life.

This approach, also supported by the spread of modern information technologies, leads to new consumer expectations (Simonse, Albayrak & Starre, 2019), which health and wellness companies must take into account to increase their satisfaction. These include the centrality of experience, the pursuit of accessibility, the transparency in communication in terms of procedures, treatments and costs and a special attention to privacy, looking for a balance between exploiting data for personalization purposes and safeguarding the security of confidential information (Agarwal et al., 2020).

Offer integration

Industrial convergence can be defined as the process of boundaries blurring through the convergence of value propositions, technologies and markets (Bröring, & Leker, 2007).

The current meaning of “health” goes beyond mere absence of illness, encompassing aspects of wellness and wellbeing (Hughner & Kleine, 2004; Wang et al., 2010; Kantar, 2021). In fact, following the definition of health provided by the World Health Organization, health can be defined as “a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity” (World Health Organization, 2024). Therefore, we can assess that the process of convergence between health and wellness is an established concept. Moreover, scholars have studied the process of convergence between healthcare and technology (Schiavone et al., 2021), identifying a digital health innovation ecosystem, in which several actors, like digital health communities, healthcare stakeholders and institutions, interact through multiple touchpoints within a digital health environment, to monitor and improve the wellbeing and health of patients, to empower patients in the management of their health and that of their families (Iyawa et al., 2016; Singhal et al., 2020). Enhancing wellness, achieving better health results, and generating broader individual and collective benefits through preventive measures necessitate an approach guided by principles such as people education, activation, engagement, and empowerment (Pennucci et al., 2022).

Within this scenario, many initiatives in health promotion and prevention are underway in response to evolving societal needs, such as an aging population and the rise of chronic diseases. Healthcare organizations are placing growing emphasis on primary care, encouraging healthy lifestyles, and supporting individuals in overseeing their overall well-being, health, and diseases (Pennucci et al., 2022). In addition to integrating within individual providers’ offerings, the integration among the offerings of various providers is also a crucial aspect in this scenario., Tthe collaboration of public healthcare organizations with the private sector aimed for the adoption of hybrid and collaborative governance structures during the pandemic, which appeared a crucial strategy for healthcare entities seeking proactive measures against future shocks (Da Ros et al., 2024), and can be crucial in the (new) normal times as well.

A lifelong journey

A recent definition of customer experience incorporates the idea of the “customer’s journey” across various touchpoints (Lemon and Verhoef, 2016, p. 6). To establish and sustain strong, positive, and enduring relationships between providers and users, the overall experience needs enhancement, by taking into account the entire user pathway across all touchpoints within a service experience (Bolton et al., 2014; McColl-Kennedy et al., 2015). A positive care experience is essential for building trust not only in private, but also in public healthcare institutions, ensuring access to care, and promoting well-being and good health (Pennucci et al., 2018). However, healthcare organizations often lack a comprehensive understanding of these journeys, which are often fragmented among different providers and settings (Nutti et al., 2017). Additionally, the design process of healthcare services frequently neglects the identification of stakeholder groups and their needs, inadequately involving them whether they are already diagnosed patients (c) or individuals with needs and preferences related to wellbeing and wellness (De Rosis et al., 2019b, Bonciani et al., 2020).

This shift towards wellbeing and wellness underscores the importance of the framework of Pennucci and colleagues (2022) revolves around education, activation, engagement, and empowerment principles, by building on the crucial role of providers, individual and communities (Huang & Lee, 2022) in enabling “health care preventive behaviors” (Jayanti & Burns, 1998). The focus on prevention is particularly intriguing in the realm of healthcare marketing (Anderson et al., 2019). It involves empowering individuals to play an active role within their personal wellbeing and health condition as well as towards the community, covering aspects from promoting health and wellbeing to daily health-related behaviors and extending to lifelong journeys, including digital landscapes and the commoditization of health goods and services (Cavusoglu & Demirbag-Kaplan, 2017). In this context, engagement becomes pivotal, emphasizing collaborative processes involving both providers and users throughout a multifaceted, lifelong health journey (Berkowitz, 2021). This holistic viewpoint not only fosters improved health outcomes but also enables individuals to assume responsibility for their well-being, aligning with the evolving understanding of health in contemporary paradigms. In this scenario, patients are engaged by the possibility of influencing their own decisions and increasing their knowledge through easier access to information facilitated by new technologies (Osei et al., 2018; François, J. et al., 2023).

Purpose of the paper. Drawing from Pennucci et al. (2022) framework, the present study aims to investigate the integration between these two industries, by exploring how individuals interact with different touchpoints provided by health and wellness providers when it comes to their daily health and wellness-related behaviors. In doing so, a

qualitative methodology based on a focus group study will be adopted, to have a deeper understanding of such phenomenon.

This study contributes to the literature on health and wellness consumers. It also offers practical insights to understand the consumer journey across healthcare and wellness industries.

Methodology and Expected Results. The aim of the present study is to explore the recent evolution of the integration between health and wellness sectors from the individuals' point of view. Given the limited insights provided by the literature on such phenomenon, we adopt an inductive qualitative approach drawing on the focus group method as an effective means of exploratory data collection (Calder, 1977; Stewart and Shamdasani, 2014; Fern and Fern, 2001). The focus group enables us to observe group interaction, which is the hallmark of this method (Belzile and Öberg 2012). This enhanced level of interaction helps participants offer multiple facets compared to one-on-one interviews (Krueger, 2014), which is especially beneficial given the complexity of the topic under investigation.

Drawing from Pennucci et al. (2022) framework, the focus group is designed to deepen understanding of how individuals experience their lifelong journey by interacting across different touchpoints in their daily health and wellness-related behaviors. As suggested by Pennucci and colleagues (2022) to make people able to improve their health and well-being, healthcare services should educate, activate, engage and empower them. According to this holistic approach, other providers such as private organizations promoting people's wellness and well-being can thus implement specific interventions to sustain them and to contribute to redesign their lifelong journey.

Following Fern and Fern's (2001) guidelines, with facilitation by a moderator and a common discussion protocol prepared prior to the research team (Bell et al., 2018), a sample between 10 and 15 participants will take part in the focus group. Specifically, a purposive sample through referrals (Arnold and Reynolds, 2003) will be used. Participants who had at least one experience with health and wellness providers through different touchpoints will be recruited, because the aim is to understand their experiences with such services.

The focus group will last around 2 h. We will start by developing a portrait of people's willingness to promote their health and wellness behaviors. We will then explore the main factors that affect this process, by focusing on those that inhibit or facilitate their education, activation, engagement and empowerment when interacting with different touchpoints. Before the focus group begins, the moderator will explain the procedure and the purpose of the session. A substantive portion of the focus group will be then developed through the use of questions such as "How do you behave with regards to your health or wellness? Have you ever interacted with health or wellness providers? How have you interacted with them? When did it occur?; What touchpoints do you usually use to interact with these services?". The session will be then transcribed. The study will adopt an interpretive methodology to identify themes emerging from the analysis of the data. According to Yin (2013), the analytic framework comprised three stages: (1) analysis of transcripts; (2) identification of common recurrent themes; and (3) analysis of shared themes. A coding team of two researchers independently will read and analyze the transcripts to ensure the internal validity of the coding process (Weber, 1990); subsequently, the results will be compared, leading to interrater reliability (Cohen, 1960), and they will be measured with Cohen's kappa coefficient (0.83). A thematic analysis will be carried out based upon themes that will emerge from the focus group.

Research limitations. Two main issues may represent limitations for this research. The first limitation may be related to validity and reliability of data collected, as results may be affected by the number and characteristics of individuals who will attend the focus group. A careful selection of participants and the conduction of the focus group by expert researchers will contribute in minimizing these limitation of the methodology. The second limitation is that, from a theoretical point of view, the topic of the study is quite new and comparing the result of the research with the existing literature may be complex.

Managerial implications. From a managerial standpoint, this research will provide valuable information to companies and organizations following this process of convergence between industries. The expected results will help managers to understand the individuals' path through the lens of consumer behavior, and to realize the person-centered approach taking into account multiple events and conditions throughout an individual's life (Starfield, 2011).

Originality of the paper. The originality of this research lies in the cutting-edge topic under study, namely the Customer Lifelong Journey across health and wellness contexts. The research thus contributes to a scarce domain in the literature, aiming to address existing gaps in the topic of convergence between health and wellness and the new lifelong customer journey.

A Well Mind, A Wise Choice: A Systematic Review of Wellness and its Influence on Food Decision-Making

SIMONA DEL CORE¹ ALESSIO DI LEO² FABIOLA SFODERA³

Abstract

Wellness is an individual state of mind that promote optimal health and well-being through personal responsibility, intentions, and actions. The dynamic nature of wellness is expressed through an active process of self-empowerment and choices, including the physical dimension associated with a lifestyle that also involves nutrition. Although the association between wellness, well-being, and health has been studied in the literature, the existing body of knowledge appears fragmented and lacks consolidation regarding the role of wellness and its dimensions in the food purchase decision-making process. A systematic literature review was conducted and a sample of 85 articles relevant to the investigation was selected. The analysis found that wellness plays a mediating function in consumer purchase decision-making, and it is represented by dimensions that relate to health: motivation to feel better, motivation for preventive health, and healthy lifestyle.

Keywords: *wellness; health; consumer behavior; decision-making process; food.*

Framing of the research. *The Food Marketing Institute (2023) recently confirmed the power of health and wellness in the food industry. This is supported by the continuous evolution of consumer choice of food consumption, and from the increased focus on selecting healthy and nutritious options (Petrescu et al., 2020; Van Loo et al., 2020). At the same time, food stores are becoming key venues for health and wellness by carrying out initiatives to meet consumers' expectations and needs (Cao et al., 2020). Examining the key factors that drive food choice is necessary to frame the food consumption perspective. According to previous studies, health-related motivations are one of the main factors driving consumers' food purchasing decisions (Ali & Ali, 2020), and elements such as high nutritional value and the potential to reduce the risk of cancer or heart disease, play a vital role in consumers' purchasing intentions (Darian & Tucci, 2011). Food choices can impact overall evaluations of life by influencing fulfillment and satisfaction, whilst recognizing that domain satisfaction can influence individual health (World Health Organization, 2011). Some authors have begun to develop and study the "Food well-being (FWB)" concept, defined as a positive psychological, physical, emotional, and social relationship with food at both the individual and societal levels. They highlight the critical relationship between food and subjective well-being in contributing to a better understanding of consumer food choices (Ares et al., 2014; Block et al., 2011; Hémar-Nicolas & Ezan, 2019). In the current context of changing health paradigms, leads to the conclusion that the transition from a medical disease paradigm to a paradigm based on well-being and wellness, in which dietary practice continues to evolve, and it is recognized that lifestyle-related behaviors, such as choosing healthy foods, play an essential role in achieving optimal health (McMahon, 2013). Traditionally, the concept of well-being refers essentially to psycho-physical health (McFadden, 2014); it involves experiencing health, happiness, and prosperity, including good mental health and high life satisfaction (McMahon et al., 2010). As the scenario evolved, it began to take on a different meaning, enriched with other aspects that Mogilner et al. (2018) identified as physical, emotional, mental, social, spiritual, organizational, material, economic, cultural, and environmental. The countless fields of application and definitions of well-being have led to considerable definitional ambiguity, which also extends to the use and its functions. The World Health Organization tended to attribute the concept of health an additional value to well-being of the mere absence of disease (WHO, 1946), defining it as a state of absolute physical, mental, and social well-being. Previous studies have observed the importance of keeping well-being and wellness distinct, especially in the food sector (McMahon et al., 2010). This distinction is crucial for understanding how nutrition can impact these two dimensions and*

developing interventions for more effective and healthier food choices. Their value is recognized in the health market as a sales opportunity for nutrition-conscious and health-conscious consumers (Short, 2005; Smith, 2005).

According to the Global Wellness Institute's definition (2023), wellness is an active and individual state of mind rather than a passive or static state, driven by personal responsibility, and associated with intentions, choices, and actions promoting optimal health and well-being. Based on this definition, wellness is positive and affirmative, a conscious, self-directed, and evolving process (Stoewen, 2015) that aims to improve well-being. Therefore, while well-being represents an achieved state, wellness is described as an ongoing journey. In light of this, wellness encompasses a holistic approach to living a fulfilling life across several dimensions such as mental, emotional, spiritual, social, and physical (Kobrin, 2017). Although there are similarities between them, wellness is distinguished by its dynamic nature, which does not represent a fixed state of being such as happy, healthy, or achieved well-being (Oliver et al., 2018). Instead, wellness involves an active process of awareness and choices, including the physical dimension consumers associate with healthy lifestyles, choices, and market offering (Wickramaratne et al., 2020).

A key difference is how the state transition dynamics lead to wellness as a change toward a new or regenerated state (Morganti et al., 2021). Therefore, wellness is upbeat and affirmative and can be considered a conscious, self-directed, and evolving process (Stoewen, 2015) aimed at improving well-being. It is definable as a state of static well-being achieved at a given time. Studies (e.g., Meiselman, 2016) have established that the concept of wellness emerges when the transition from "being healthy" to "feeling better" occurs.

Wellness appears to be more relevant for investigating the food decision-making process precisely because of the field of application of food consumption (Nunes et al., 2020). Food consumption is a continuous activity over time, and a healthy diet confers longevity due to its body's effects (Moosavi-Movahedi et al., 2021).

Some studies have observed that during the food purchasing process consumers are susceptible to a wide range of socio-psychological and cultural models that influence consumer decision-making (Bublitz et al., 2010). Therefore, the ways in which consumers make decisions are influenced by wellness-related factors such as the propensity to longevity and being in good health (Nunes et al., 2020).

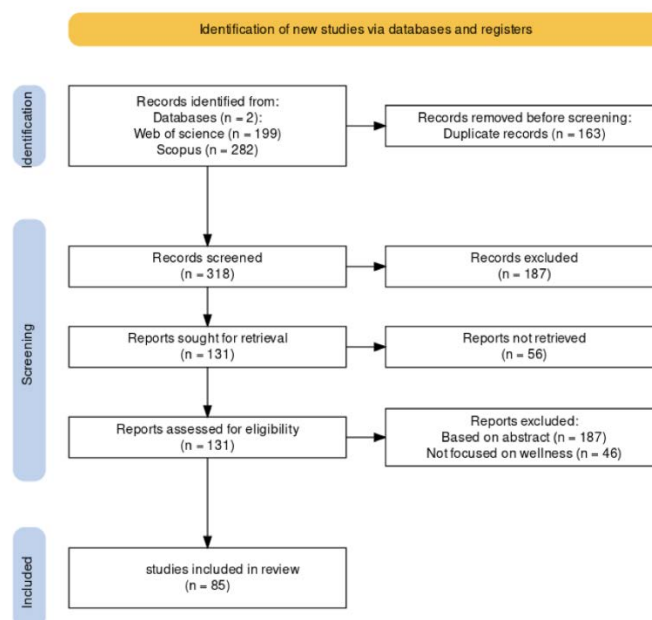

During the evaluation of alternatives phase, the consumer evaluates product's attributes, making comparisons and at the same time looking for benefits deriving from the specific product (Puth et al., 1999). Previous research (Van Der Merwe et al., 2010) stated that the healthiness of the products is evaluated in a phase prior to the evaluation called "pre-purchase search"; in the evaluation phase, however, consumers pay attention to nutritional information and information regarding ingredients which have to do with overall quality. The product attributes that consumers positively evaluated during purchasing decisions appear to be quality (Ali et al., 2021) and health benefits, followed by nutritional content, hygiene, certification of the food product, and the natural content of the product.

Understanding the differences between well-being as an achieved state and wellness as an ongoing process focused on improvement allows researchers to delve deeper into how consumers make decisions influenced by factors like longevity and perceived health benefits.

Purpose of the paper. The study aimed to explore the scientific literature to identify how wellness and related health dimensions influence food purchasing decision-making. Specifically, the aim is to delineate the dimensions that explain wellness and their influence on consumer decision-making.

Methodology. This work examines research related to the food decision making complex by applying the Preferred Reporting Items for Systematic Reviews (PRISMA) guidelines (Moher et al., 2015).

Figure 1: PRISMA Protocol

To achieve a comprehensive overview of the previous research in food decision making we searched on Scopus and Web of Science databases. We chose these databases for the reliability of their selection standards and their diffusion within the academic community (Singh et al., 2021). The total number of articles identified on the databases amounted to 481 articles, of which 199 on Web of Science and 282 on Scopus.

“Food decision making“, “food choice“ as well as “health“, “wellness“ and “wellbeing“ are often used interchangeably to describe the behavior of individuals depending on the discipline in which food consumption is analyzed, and on the background of the researcher. In the initial stage of this study, we identified the most common terms by conducting preliminary searches and by evaluating references in sample articles. The search terms had to appear in the title, in the abstract, or in the keywords of the article.

To ensure that only relevant articles are included in the final analysis, we identified as exclusion criteria publication and content. Only academic peer review journals were considered. Non-academic articles, opinions, experience papers, books or book sections, and conference proceedings were excluded. Then, articles which do not focus on food decision-making, and are published out of English have been eliminated. This process resulted in the selection of a total of 85 items (Fig. 1).

Since the DONE framework (Stok et al., 2017) is an interdisciplinary approach to classifying research efforts on food decision-making, we sought to reveal relationships between disciplines. To operationalize the disciplines in which studies on food decision-making are published, we used the journal as a proxy. The scope of an individual journal was derived from the journal description on the respective website. Two researchers independently analyzed the titles, abstracts, and full texts to identify the primary results of the studies examined. In case of doubts about the classification of a publication or disagreement between researchers, categories have been added, expanded, or changed. This led to the identification of 5 categories: medicine/health sciences, psychology, marketing and consumer research, business economics, and sociology.

Results. The work is still in progress, but some reflections have already been identified. The factors that influenced consumers' decision-making can be categorized in: (i) motivations such as the desire to improve well-being (care), (ii) preventive health measures, and (iii) commitment to a healthy lifestyle. Wellness intended as "path of improvement" is achievable through food therapy. It is represented by these dimensions referring to health motivations (i; ii; iii). Scholars have investigated the connection between health and wellness (Schuster et al., 2004; Martino et al., 2017; Oliver et al., 2018). Some indicators of health, healthy lifestyle (Lucini et al., 2015), care and prevention (Pappalardo et al., 2016) can be a proxy for wellness representing its maximization (Dunn, 1959). This research hypothesizes that wellness mediate effects of products' healthy dimensions on purchase decision-making process. The independent variable (healthy dimension) refers mainly to organic products and functional foods. The mediation relationships between variables are expressed in the figure below (fig. 2). These findings are corroborated by previous studies that confirm wellness as a mediating variable in the decision-making process (Green et al., 2020; Patel & Wolfe, 2020; Choi et al., 2015) and evaluate the desire for health and wellness as an important driver in purchase decision (Kareklas et al., 2014), especially in the food market (Irene Goetzke & Spiller, 2014).

Figure 2: The Care–Prevention–Healthy lifestyle Dimensions of Wellness Mediate Food Purchase Decision-making

Care motivation refers to behaviors that improve people's physical wellness (Pappalardo et al., 2016). It thus signals the motivation of individuals with an impaired health status to take action to achieve a subsequent improved health status. The difference between this motivational type and the health-preventive type is inherent in the finding that the former may be outside of self-determined needs but is rather driven by health needs. The motivation to feel better has a significant influence on purchasing decisions (Li et al., 2014), and scientific research has investigated the relationship between dietary behavior to comply with and certain abnormal health conditions. For example, previous studies have explored reducing salt intake to combat obesity (Bolha et al., 2020), or diagnosed conditions such as diabetes led to an increased propensity to choose sugar-free and no-added-sugar labels (Albuobaid & Al-Mahish, 2022). Referring to the impact on

purchasing decisions, scholars have observed that diabetic consumers are twice as likely to purchase sugar-free and no-added-sugar labels as non-diabetic consumers (Albuobaid & Al-Mahish, 2022).

There seems to be consensus in the scientific literature that health problems influence food choice (Madeira & Goldman, 1989). Previous research (e.g., O'Brien et al., 2015) explored the role of health in consumers' decisions regarding food purchases, offering insights into how the motivation to enhance well-being influenced the selection of specific food varieties to address nutritional needs or conditions.

Conversely, preventive health motivation refers to the direct intention of consumers to engage in preventive health behaviors (Moorman & Matulich, 1993; MacInnis et al., 1991; Jayanti & Burns, 1998). Health motivation - especially in the form of a high trend towards prevention - is an important predictor of involvement in purchasing decisions and information use (Kamrath et al., 2019). For preventive reasons to health, therefore, refers to the motivation that is activated to achieve through nutrition a state of wellness that can act in advance on an abnormal state, going to prevent diseases. Previous studies have analyzed the purchase of healthier foods to increase the health and immunity of the body during the pandemic (Yusmarni et al., 2021) or the reduction of iodine for health benefits (De Melo et al., 2022), the purchase of functional foods for health support and to eliminate the risk of developing different diseases (Predanócyová et al., 2023), highlighting the influence of food safety on decision-making. Therefore, as confirmed by previous studies (e.g., Pappalardo et al., 2016), consumers would be looking for foods that have healthy characteristics that can prevent disease and improve people's physical wellness. The motivation for health translates into a preference for purchasing organic products and functional foods. The reasons why consumers buy organic products is because they believe they are better for their health (Suphaskuldamrong et al., 2021).

Healthy lifestyle refers to healthy behaviors that individuals adopt to move from an already favorable condition to an improvement condition. The prevailing orientation concerns the intention to live in a healthy way (Setiyaningrum & Batu, 2019). Research has observed a significant effect (Setiyaningrum & Batu, 2019) between the intention to live healthily and purchasing decisions. Consumers guided by a healthy lifestyle are projected towards improving and conscious food choices. This attitude leads them to food products not distinctly designated to represent certain relationships (e.g., spinach to prevent iron deficiency), but towards healthy lifestyles (Seal & Bag, 2022; Urbonavičius et al., 2010) encouraging consumers to pay attention to all the characteristics of products (e.g. proteins to improve muscle mass).

Research limitations. The lack of validation of the dimensions detected by the literature review is a limitation of this study. Therefore, the use of quantitative and qualitative methodologies will be envisaged to resolve this limit. As we used the journal as a proxy to code the disciplines, future studies could code previous research efforts according to the discipline of the study itself or according to the affiliation of the authors. This might be helpful to gain new insights into the cross-disciplinary collaboration of researchers.

Managerial implications. As consumers increasingly integrate health-related values into their decision-making, marketers must comprehend how these belief systems impact the entire consumers' experiences. Having a clearer vision of the dimensions that represent wellness has not negligible managerial implications. Based on recognized consumer segments and the motivation that arises, whether curative, preventive or improvement, consumers should receive tailored information to aid them in their decisions regarding food consumption. In addition, understanding the factors influencing the decision-making process for purchasing healthy food is valuable for manufacturers in the design and development of new and healthier food products and will guide them to properly segment their markets in terms of choice of where and how to market these products.

Originality of the paper. To the best of our knowledge, no study has attempted to synthesize the literature on food decision-making across different disciplines. The research considers the relationship between wellness nutrition and consumer decision-making, to understand how the wellness and the underlying motivations that guide him can be inserted and activated in the decision-making process by grasping the differentiations resulting from the type of motivation activated: curative, preventive, improving.

Taste-Makers Narratives: Analyzing the Effect of Food Influencers on Home Cooks

FRANCESCO SMALDONE¹ GIADA MAINOLFI²

Framing of the research. *In the digital age, the culinary landscape has undergone a significant transformation, largely influenced by the advent of Social Media influencers in the food and dining sector. The culinary world is no longer confined to the pages of cookbooks or the walls of Michelin-starred restaurants. Instead, it has seamlessly integrated itself into the fabric of Social Media platforms, captivating audiences worldwide through the lens of food influencers (Abell & Wisbas, 2023). These individuals, armed with little more than a smartphone and a passion for food, have become the modern-day storytellers of gastronomy, captivating audiences with tantalizing images, captivating narratives, and irresistible recipes (Lee et al., 2021). From the bustling streets of Tokyo to the quaint cafes of Paris, Social Media has become the global stage where culinary delights are showcased, celebrated, and shared. Whether it is a meticulously plated dish crafted by a renowned chef or a humble home-cooked meal prepared by an everyday enthusiast, the democratization of food culture has empowered individuals to explore, experiment, and engage with cuisine in unprecedented ways (Qutteina et al., 2019). The rise of food influencers on platforms like Instagram, YouTube, and TikTok has reshaped the dynamics of the food industry, blurring the lines between consumers and creators (Coates et al., 2020; De Jans et al., 2021). These influencers, ranging from seasoned chefs to self-taught culinary enthusiasts, have leveraged Social Media to share their culinary creations, tips, and dining experiences with a global audience. This phenomenon has not only democratized gourmet culture but also blurred the traditional boundaries between consumer and producer. What began as a grassroots movement fueled by a love for food and a desire to share culinary experiences has evolved into a multimillion-dollar industry, where partnerships, sponsorships, and brand collaborations abound (De Keyzen, 2023).*

The premise of this research is to explore the extent to which Social Media influencers have impacted consumer behavior in the food industry, transforming them into “prosumers” - individuals who are not just passive consumers but also active creators, recreating influencer-endorsed recipes at home or advocating for their inclusion in restaurant menus for an enhanced dining experience (Wu et al., 2023). This study delves into the dynamics of this transformation, examining the motivations behind consumer engagement with food influencers and the consequent effects on the food and dining industry (Smaldone et al., 2021). By unraveling these motivations, the research seeks to elucidate the ripple effects on the food and dining industry, including shifts in consumer preferences, dining trends, and culinary innovation (Mainolfi et al., 2022).

Purpose of the paper. *At its core, the purpose of this paper is a quest to unravel the intricate interplay between Social Media influencers and the food industry, understanding the implications of this symbiotic relationship on consumer behavior, dining trends, and culinary culture at large (Kei, 2024).*

Through several methodologies and data-driven insights, our aim is twofold: first, to dissect the mechanisms through which food influencers wield influence over their audiences, deciphering the underlying motivations, narratives, and emotional triggers that drive consumer engagement with influencer-generated content (Barusman & Suwandi, 2020). By peeling back the layers of Social Media discourse, we seek to uncover the hidden patterns and trends that shape consumer preferences, behaviors, and perceptions in the realm of food (Packer et al., 2022). Second, we endeavor to contextualize our findings within the broader socio-economic scenario, probing the ripple effects of influencer culture on the food industry and trends (Folkvord et al., 2020). By examining the impact of influencer endorsements on consumers, the transformative potential of influencer-driven dining preferences on restaurant menus, and the catalytic role of influencers in fostering culinary innovation and diversity, we aim to provide stakeholders with actionable insights to navigate the evolving landscape of food marketing and consumer engagement.

In essence, this paper serves as an exploration of the food influencers universe in the digital noise, offering a nuanced understanding of the dynamics at play in the realm of food influencer marketing (Campbell & Farrell, 2020). By shedding light on the opportunities, challenges, and ethical considerations inherent in this burgeoning phenomenon, we aspire to equip scholars, practitioners, and policymakers alike with the knowledge and foresight needed to harness the transformative potential of Social Media influencers for the food industry and society at large.

² Associate Professor of Management – University of International Studies of Rome (UNINT)
e-mail: giada.mainolfi@unint.eu

Methodology. Amidst this cultural shift, it becomes imperative to explore the multifaceted impact of food influencers on consumer behavior and the broader food and dining landscape. This research endeavors to delve deep into the nuances of this phenomenon, employing a multifaceted approach that combines text mining, topic modeling, sentiment analysis, and predictive analytics (Tanwar et al., 2022). By harnessing the knowledge derived of data extracted from Social Media platforms, particularly Instagram, this study seeks to unravel the motivations behind consumer engagement with food influencers. Data were retrieved from profiles of two eminent food influencers (Chopra et al., 2018). Through text mining techniques, we aim to decipher the underlying themes, trends, and sentiments prevalent in influencer-generated content, shedding light on the factors that drive consumer preferences and behaviors in the realm of food (Aggarwal & Zhai, 2012).

Notwithstanding, employing topic modeling methodologies will allow us to identify key themes and topics that resonate with audiences, providing insights into the evolving trends and narratives shaping the culinary discourse on Social Media (Gupta & Lehal, 2009). Coupled with sentiment analysis, which discerns the emotional tone and reactions associated with influencer content, we can gain a comprehensive understanding of the consumer sentiment towards different culinary experiences, cuisines, and food products endorsed by influencers. Furthermore, by leveraging predictive analytics, this research aims to forecast future trends and developments in the food industry, informed by the evolving preferences and behaviors of consumers influenced by Social Media influencers. By extrapolating patterns and correlations from historical data, we can anticipate shifts in consumer demand, dining preferences, and market dynamics, thereby empowering stakeholders in the food industry to adapt and innovate in response to emerging trends (Schoenherr & Speier-Pero, 2015).

In essence, this research endeavors to unravel the intricate web of influence woven by food influencers on Social Media platforms, elucidating the transformative impact they wield on consumer behavior, dining trends, and the broader culinary landscape (Storey & Song, 2017). Through empirical analysis and data-driven insights, we aim to understand the pathways through which Social Media influencers shape the way we eat, cook, and experience food in the digital age.

Results. The research analyzed corpora from the two selected food influencers via text analysis, designed to investigate the corpus frequencies via stylometry and frequency count. To assess the weight of term frequencies (tf), and then perform several big data techniques, as described in the Methodology.

Results from text mining revealed several differences and similarities between both the influencers' profiles. In particular, differences were found in the commented recipes and items, and similarities were found in terms of engagement and intentions. Primary text entities concerning the first influencer were: happy birthday (tf = 7164), bsk burger (tf = 4284), lamb sauce (tf = 3394), merry Christmas (tf = 2672), looks good (tf = 2546), looks amazing (tf=2543), gnocchi pasta (tf=2477), beef wellington (tf=2424), idiot sandwich (tf=2296), pizza dough (tf=1983), and baked salmon (tf=1849). The most frequent terms in the corpus of the second influencer were the following: looks delicious (tf = 47336), great idea (tf = 44571), looks amazing (tf = 40152), mashed potatoes (tf = 31217), gluten free (tf = 27583), find recipe (tf = 27583), lentil soup (tf = 27583), pasta recipe (tf = 27583), chocolate cookies (tf = 27583), banana bread (tf = 27583), and thanksgiving special (tf = 27583). Concerning Topic Modeling, text entities were clustered in four groups.

Topics for the first influencer were the following: (a) *Gourmet Creations*: this topic encompasses sophisticated dishes such as "bsk burger," "lamb sauce," and "beef wellington," reflecting the influencer's focus on elevated culinary experiences. (b) *Festive Celebrations*: terms like "happy birthday" and "merry Christmas" dominate in the topic, indicating content centered around special occasions and seasonal festivities. (c) *Visual Appeal*: Expressions like "looks good" and "looks amazing" suggest a strong emphasis on visual presentation and aesthetic appeal in the influencer's posts. (d) *Diverse Palates*: This topic includes mentions of a variety of dishes, from "gnocchi pasta" to "pizza dough" and "baked salmon," showcasing the influencer's versatility in culinary exploration.

The second influencer revealed the following topics: (a) *Sensory Delights*: Terms like "looks delicious" and "great idea" indicate a focus on enticing and appetizing visuals, appealing to the senses of the audience. (b) *Comfort Cuisine*: This topic revolves around comforting dishes like "mashed potatoes," "chocolate cookies," and "banana bread," evoking feelings of warmth and nostalgia. (c) *Dietary Diversity*: With mentions of "gluten-free" and "lentil soup," this topic highlights the influencer's commitment to catering to diverse dietary preferences and lifestyles. (d) *Seasonal Specialties*: Terms such as "thanksgiving special" suggest a thematic focus on seasonal and holiday-inspired recipes, resonating with the audience's culinary traditions and celebrations.

Focusing on sentiment analysis, results show that in the first corpus 86% of comments were positive, 10% were neutral, and 4% were negative. In the second corpus comments were 92% positive, 4% neutral, and 4% negative.

The results from the text mining analysis offer valuable insights into the distinctive profiles of the two influencers under scrutiny. Notably, differences were observed in the types of recipes and items frequently mentioned by each influencer, while similarities emerged in terms of audience engagement and underlying intentions. For the first influencer, primary text entities revolved around specific dishes such as "bsk burger," "lamb sauce," and "beef wellington," alongside common expressions like "happy birthday" and "merry Christmas.". Conversely, the second influencer's corpus featured prevalent terms like "looks delicious," "great idea," and "mashed potatoes," indicative of a different culinary focus. For the first influencer, the emphasis seemed to be on gourmet creations, festive celebrations, visual appeal, and diverse palates, reflecting a multifaceted approach to culinary content creation. The second influencer's topics centered around sensory delights, comfort cuisine, dietary diversity, and seasonal specialties, highlighting a focus on appealing to diverse sensory experiences and catering to varied dietary preferences. Despite these variances, sentiment analysis revealed overwhelmingly positive feedback for both influencers, underscoring the effectiveness of their content in resonating with their respective audiences.

Research limitations. *Considering the complexities of food influencer effects, it is essential to acknowledge the inherent limitations that shape the scope and breadth of our research endeavor.*

First and foremost, while Social Media platforms like Instagram offer a rich repository of data ripe for analysis, it is important to recognize the inherent biases and limitations inherent in such datasets. The algorithms governing content visibility and engagement on these platforms may skew our analysis towards content that is more popular or algorithmically favored, potentially overlooking niche or marginalized voices within the influencer community.

Additionally, the nature of Social Media discourse is inherently dynamic and ephemeral, subject to rapid shifts in trends, narratives, and audience preferences. As such, our analysis may capture only a snapshot of the ever-evolving landscape of food influencer culture, potentially missing out on emerging trends or nuances that may have profound implications for our understanding of consumer behavior and industry dynamics.

Nevertheless, the methodologies employed in this research, including text mining, topic modeling, sentiment analysis, and predictive analytics, are not without their limitations. While these techniques offer powerful tools for extracting insights from large-scale datasets, they are not immune to errors, biases, or misinterpretations. As such, our findings should be interpreted with caution, recognizing the inherent uncertainties and limitations inherent in the analytical process. Our research is inherently limited by the availability and quality of data accessible to us. Efforts have been made to collect and analyze data from a diverse range of sources, including influencer-generated content, consumer feedback, and market trends, it is possible that certain data points may be missing or incomplete, potentially limiting the depth and accuracy of our analysis.

Finally, it is important to acknowledge the broader socio-cultural context within which our research is situated. Influencer culture is deeply intertwined with broader trends in consumerism, digital media, and celebrity culture, making it challenging to disentangle the unique impact of influencers on consumer behavior from the myriad other factors at play. As such, while our research endeavors to shed light on the transformative power of food influencers, it is but one piece of a much larger puzzle, leaving ample room for further exploration and inquiry.

Managerial implications. *Within the landscape of food influencer culture, our research unveils profound managerial implications that warrant strategic consideration and thoughtful implementation by stakeholders across the food industry. The influence of Social Media influencers in the food and dining sector signifies a shift towards a more engaged and participatory culinary culture, where consumers are empowered to become creators. This transformation has profound implications for consumer behavior, dining trends, and the culinary industry at large. As this trend continues to evolve, further research is needed to understand its long-term impacts on the food landscape and consumer identities as prosumers. Primarily, our findings underscore the pivotal agency wielded by influencers in shaping consumer preferences and behaviors within the contemporary digital milieu. For food brands and culinary enterprises, this implication constitutes a compelling imperative to harness influencer partnerships as strategic instruments for brand propagation, product endorsement, and audience engagement. By discerning influencers whose ethos and aesthetic resonate harmoniously with their brand identity, companies can efficaciously magnify their outreach and resonance among target demographics, thereby fostering brand allegiance and propelling sales figures.*

In specie, our insights furnish actionable intelligence for strategic deliberation in the domains of product innovation and promotional endeavors. By discerning the salient themes, trends, and affective tonalities prevalent within influencer-generated content, brands can adeptly tailor their product portfolios and promotional initiatives to align seamlessly with consumer predilections and cultural zeitgeist. Whether it entails capitalizing upon emergent culinary vogues endorsed by influencers or aligning brand messaging with the aspirational ideals championed by prominent influencers, enterprises stand to gain a competitive edge by attuning themselves to the evolving contours of influencer discourse.

Besides, our research underscores the exigency of authenticity, transparency, and ethical rectitude in the realm of influencer-brand collaborations. As contemporary consumers grow increasingly discerning and skeptical of contrived promotional content, brands are impelled to prioritize authentic, substantive partnerships with influencers who embody their brand ethos organically. By cultivating genuine connections and narratives that resonate authentically with audiences on an intimate level, brands can engender trust, credibility, and enduring loyalty amidst an era beset by digital clamor and commercial commodification. Additionally, our findings accentuate the latent potential of influencer marketing to engender tangible impacts for enterprises ensconced within the gastronomic landscape. Considering the latest trends, through judicious utilization of hyper-local influencers espousing the virtues of neighborhood gastronomic establishments and artisanal purveyors, small-scale enterprises could expand their sphere of influence and draw fresh patronage within an increasingly competitive marketplace milieu. Furthermore, collaborative initiatives between influencers and local businesses can evoke a sense of communal camaraderie and cultural verisimilitude, thereby enriching the gastronomic experience for consumers and fortifying the economic vitality of ecosystems.

In sum, our research serves as a clarion call to action, accentuating the transformative potential inherent within the nexus of food influencers and brand engagement. By embracing the strategic imperatives and negotiating the attendant challenges embedded within influencer culture, enterprises stand poised to unlock novel pathways for growth, innovation, and market differentiation amidst the tumultuous terrain of the digital epoch.

Originality of the paper. *Considering the burgeoning discourse surrounding Social Media influencers and their implications on consumer behavior, our research distinguishes itself through methodological complexity and conceptual innovation in unpacking the nuanced dynamics of food influencer culture.*

Primarily, our study adopts an integrative analytical framework encompassing text mining, topic modeling, sentiment analysis, and predictive analytics to elucidate the multifaceted facets of influencer-mediated consumer behavior within the culinary domain. By synthesizing these disparate methodologies, we endeavor to furnish a nuanced comprehension of the underlying motivations, trends, and affective dimensions pervading influencer-generated content, thereby elucidating the mechanisms through which influencers exert influence over consumer preferences and gastronomic trends. Thus, our research contributes to the extant scholarly discourse by contextualizing the phenomenon of food influencer culture within the broader socio-economic milieu, interrogating its ramifications for local enterprises, culinary innovation, and ethical consumption paradigms. Through an examination of the repercussions of influencer endorsements on consumers and the transformative potential of influencer-driven gastronomic trends on industry dynamics, our study proffers novel insights into the manifold ways in which influencers shape the gastronomic landscape.

Specifically, our inquiry extends beyond empirical observations to enrich theoretical frameworks pertaining to consumer behavior in the digital epoch, delineating the concept of “prosumerism” - wherein consumers transcend their passive role as mere recipients of influencer content to actively participate in the creation and dissemination of culinary experiences. Through a fusion of empirical inquiry and theoretical synthesis, we aspire to illuminate the transformative implications of this paradigm shift towards prosumerism for consumer identities, industry paradigms, and broader socio-cultural narratives.

Concluding, our research offers seminal contributions to the scholarly discourse surrounding the transformative agency of food influencers within the contemporary gastronomic landscape. By embracing innovative methodologies and conceptual frameworks, we endeavor to push the frontiers of scholarly inquiry and engender a deeper understanding of the intricate interplay between digital media, consumer behavior, and culinary culture.

Building a Better Future: The University Activism for Societal Wellbeing

ANTONELLA CAMMAROTA¹ FRANCESCA AVALLONE² VITTORIA MARINO³
RICCARDO RESCINITI⁴

Framing of the research. *Our society is very much in crisis and is addressing complex, urgent, and deeply polarized social challenges (Podnar and Golob, 2024; Weber et al., 2023). Climate change, immigration, discrimination, health disparities, access to education, the gender gap, persistent poverty in certain regions, police violence, civil rights, ongoing conflicts like the Russia-Ukraine war (D'Arco et al., 2023), Israel-Palestine, and the increasing geopolitical tensions are issues that deeply concern public opinion. These challenges contribute to a fragmented and discordant public sentiment (Vredenburg et al., 2020), heightening individuals' susceptibility.*

Governments appear either disinterested or incapable of effectively addressing these issues (Radanielina Hita and Grégoire, 2023) and the goals of the Agenda 2030 seem increasingly distant and difficult to achieve. Consequently, new players have emerged on the scene, such as activist brands. However, they encounter troubles (Bhagwat et al., 2020) linked to the fact that consumers usually perceive brand activism as a mere marketing ploy to increase their sales and power (Mirzaei et al., 2022), leading to a phenomenon known as "woke-washing" (Sobande, 2019).

In this scenario, new activists seem to emerge who act differently and pursue high-social purposes. Universities are stepping into the forefront as pivotal agents of social change, leveraging their long-standing influence as beacons of knowledge, ethics, and societal norms by exploiting their highly specialized skills and expertise (Eschle, 2006). Transitioning beyond traditional roles of social responsibility, universities are beginning to adopt activist stances to drive societal transformation (Barnett, 2021), akin to brands in the corporate world that engage in activism. This shift sees universities not just as places of learning but as active participants in addressing societal issues, effectively becoming living laboratories for social good (Choudry, 2020).

Drawing parallels with the concept of brand activism (Sarkar and Kotler, 2020), universities are applying similar strategies to fulfill societal needs. Just like corporations have used "brand activism" (Ahmad et al., 2024; Andersen and Johansen, 2024; Mukherjee and Althuisen, 2020) to address and influence socio-political issues, universities are now harnessing their intellectual resources, research capabilities, and community connections to engage in and promote social activism. This includes taking public stances on controversial issues, engaging in policy advocacy, and implementing programs that drive change in the society (Wannow et al., 2023; Bhagwat et al., 2020).

Given the main goal of the activist strategy, which aims to bring about social change by influencing the intentions, attitudes, and behaviors of stakeholders (Eilert and Nappier Cherup, 2020), universities also appear to employ the public engagement strategy to actively involve stakeholders in addressing significant these issues on a broader scale.

Engagement is a strategic approach designed to interact, listen, and actively involve stakeholders on emotional, cognitive, and ultimately behavioral levels (Hollingshead et al., 2018). Universities frequently employ this strategy to address their increasingly relevant "Third Mission". Nowadays, universities seem to incorporate activist goals into their dynamic public engagement systems as useful tools to implement their social role (Lo Presti et al., 2023). In fact, they not only spend themselves on social, environmental, political, and economic issues but also use university public engagement systems in order to engage students, faculty, staff, the local community, businesses, non-governmental organizations (NGOs), and government institutions (Hart and Northmore, 2011).

Furthermore, the activist strategy is intrinsically public and needs to be communicated through every visible means (Korschun, 2021). Considering the paramount significance of institutional communication for universities, it emerges as a fitting channel to convey activist efforts. University websites, in particular, serve as crucial platforms for communicating the institution's identity, objectives, mission, goals, and updates (Marino and Lo Presti, 2020; Steiner et al., 2013). Moreover, institutional communication stands out as a powerful engagement factor for higher education institutions (Rodríguez-Gómez et al., 2022). By leveraging their online presence in this manner, universities not only enhance their stakeholder engagement but also solidify their standing and reputation as influential agents of social change. This evolution underscores the significant role that online communication plays in higher education today, reflecting a broader

shift towards a more engaged, proactive university model that actively contributes to societal discourse and transformation (Foroudi et al., 2020).

Purpose of the paper. This study is grounded in two pivotal strands of literature that have garnered considerable attention from both researchers and practitioners: “brand activism” and “public engagement”. It aims to first understand whether or not activism is implemented by universities; second, to map and identify its pillars and key factors; and finally, to provide a first definition of university activism. This research analyzes the emerging phenomenon of activist universities, underlining how high education institutions are evolving their role and becoming increasingly catalysts for social good by implementing engagement and activism strategies. Therefore, based on the study’s main purpose of defining university activism and mapping its pillars, the following research questions guided our analysis:

Rq₁. Are universities starting to act as activists in driving social change?

Rq₂. How do universities engage in activism to impact the common good?

Rq₃. How do universities communicate these efforts?

Rq₄. Finally, how can university activism be defined?

Methodology. This research adopts a qualitative by utilizing multiple case studies (Fuchs and Robinson, 2023; Yin, 2009; Eisenhardt, 1989); thus, 30 websites of high-ranked American universities were analyzed. Based on the purpose of this study and the research questions, we have deemed the analysis of university websites as the most suitable method for comprehending how universities participate in activism and utilize institutional communication to disseminate it while engaging stakeholders. Institutional websites serve as a direct link between universities and their stakeholders (Lo Presti and Marino, 2020), rendering them indispensable for content analysis in this context.

Moreover, we focused the analysis on the American context since it presents a strongly polarized society and a historical role as the birthplace of significant social movements, profound struggles, and activism. Notably, brand activism itself originated in the American context, and a substantial portion of the research in this field is conducted within the United States (Cammarota et al., 2022).

Data collection involved systematically categorizing information into an Excel matrix, structured around the research questions and study purpose. The researchers applied a funnel approach, starting with the evaluation of university homepages and progressing to deeper levels to obtain a comprehensive understanding (Krippendorff, 2013). The analysis of the university sample underwent two rounds of examination by the researchers to enhance the reliability and robustness of the data collection process, ensuring thoroughness and accuracy.

Content analysis was performed for data analysis (Hsieh and Shannon, 2005), drawing inspiration from the “4W of Brand Activism” framework (Cammarota et al., 2023). Coding principles guided data analysis following Saldana (2013). Researchers conducted independent data analysis (Wang et al., 2021). Subsequently, the coding process underwent thorough examination and discussion to detect any mistakes. The results were then deliberated within group discussions for comprehensive evaluation.

Results. The findings show intriguing insights that serve as a foundation for developing the concept of university activism by providing some foundational pillars and a primary definition of university activism. Firstly, the universities under scrutiny exhibit varying degrees of involvement in activist actions, revealing a phenomenon that is prevalent in practice yet remains underdeveloped in the existing literature. Our first investigation allows for the identification of critical aspects and key factors of this new phenomenon (Rq₁).

Secondly, results show that universities undertake diverse activist endeavors to contribute to societal well-being and involve their stakeholders in these efforts. Specifically, they utilize education and research to “disseminate” knowledge and raise awareness of controversial issues. Furthermore, universities actively “promote” their initiatives through various means such as celebrations, memorial days, or training sessions on social matters, intending to engage stakeholders on cognitive, emotional, and behavioral levels. Ultimately, they seek to “push” concrete actions among stakeholders through avenues like donations, volunteering, and other socially impactful activities (Rq₂).

Thirdly, findings highlight that universities strongly communicate their activist efforts through the university’s official website, social media platforms, and other relevant channels (Rq₃).

Lastly, to fulfil the purpose of this study, we provide a first definition of university activism based on the obtained results. Specifically, university activism is “a strategy to act on contentious socio-political, economic, and environmental challenges through disseminating, promoting, and pushing actions, all publicly declared aimed at engaging stakeholders in social change” (Rq₄).

The universities analyzed allowed us to highlight the pillars, practices and aims of university activism. For instance, “The Pace Center for Civic Engagement” at “Princeton University” exemplifies university activism by recognizing and promotes a broad spectrum of university advocacy organizations. These groups, ranging from those advocating for prison education reform to those focused on social entrepreneurship and healthcare equity, tackle a variety of important societal issues. The recognition process ensures these organizations receive the sponsorship needed to move their ideas into actionable outcomes. Similarly, the “Washington University” has established an “Activism” section within its academic offerings, dedicating resources to research and study across departments like Ethnic Studies, Gender Studies, and Law, Societies, and Justice. This approach not only facilitates student involvement in activism but also integrates these disseminating efforts into the university’s academic framework, further emphasizing the role of educational institutions in societal change.

Expanding upon the collaborative landscape of university activism, these institutions are not only nurturing vibrant internal communities such as centers and affinity groups dedicated to social change but are also proactively seeking

external alliances that enhance their impact on societal challenges. Through forging strategic partnerships with a spectrum of organizations ranging from local community groups and NGOs to industry leaders and innovative startups, universities amplify the reach and effectiveness of their activism. These collaborations enable a unified approach to addressing the multifaceted nature of today's societal issues, leveraging shared resources, expertise, and networks.

For instance, "Massachusetts Institute of Technology" (MIT) through its "MIT Solve initiative", collaborates with technologists, social entrepreneurs, and policymakers to address global challenges. This platform exemplifies how universities can serve as hubs for innovation, bringing together diverse actors to work on sustainable urban environments and other pressing issues.

The ecosystem of involved actors in these partnerships is diverse, bringing together a dynamic assembly of academic staff, students, alumni, and various external stakeholders. From this perspective, the "University of California, Berkeley" (UC Berkeley), through its "Berkeley Food Institute", exemplifies university-led activism by partnering with community organizations and local governments to transform the food system. Focused on sustainable agriculture, food equity, and community health, the initiative engages in research, policy advocacy, and community projects to improve food access and promote sustainable practices. By connecting local farmers with food banks and schools, and advocating for policies supporting food safety, labor rights, and environmental sustainability, UC Berkeley demonstrates how universities can act as powerful agents of social change, advocating and pushing for a more equitable and sustainable food system.

This collective effort fosters a rich tapestry of perspectives and strategies, driving forward initiatives that are inclusive and impactful. The target audience of these collaborative ventures extends beyond the immediate university community, aiming to engage prospective students, policymakers, industry partners, and the broader public. Such inclusivity ensures that the activism spearheaded by universities resonates across multiple spheres of society, engaging a wide range of participants in dialogue and action. These partnerships not only enhance the capacity for social change but also position universities as pivotal nodes within a larger network of societal transformation, where the convergence of education, innovation, and activism ignites progressive developments across communities and beyond.

Research limitations. This study has some limitations that can serve as avenues for future research. First, this study was confined to the United States, with an analysis focused on 30 highly ranked universities. Consequently, more research is needed including other countries and universities. This expansion is essential to validate, confirm, and generalize the results obtained, ensuring a more comprehensive understanding of the phenomenon.

Second, this study exclusively concentrates on websites, overlooking the fact that activism is predominantly executed through social media platforms. Therefore, future research should explore whether and how universities communicate their activist initiatives specifically on social media, examining the nuances and strategies employed in this digital space. Third, it is required to gain a nuanced understanding of the actions undertaken by activist universities, particularly mapping their execution, the involved stakeholders, and the specific target audience they aim to address.

Fourth, there is a crucial need to comprehend the outcomes of university activism, both in terms of its impact on the institution itself and its influence on civil society.

Finally, the construct of university activism should be fortified through additional research, coupled with the application of appropriate quantitative methods for operationalization.

Managerial implications. The present study has both theoretical and managerial implications. From a literature standpoint, this study not only identifies but also "labels" a novel phenomenon. It offers a first definition, highlighting crucial aspects and key elements that characterize it. Consequently, it establishes itself as a guiding reference for researchers to address future studies on this unexplored phenomenon.

Instead, from a managerial perspective, this study stresses the central role that universities can play in instigating social change, presenting an overlooked perspective for practitioners. While the phenomenon is undoubtedly gaining traction in the United States, it remains relatively obscure to the general public and other institutions.

Thus, this article is a "warning" for practitioners by offering them the best practices to implement in universities to address societal change and engage in activism. Additionally, insights are provided to effectively conduct efforts, enhancing universities' roles as catalysts for social transformation.

The relevance of strategic communication is stressed to obtain stakeholder engagement. Moreover, the study highlights the importance of building partnerships with local communities, non-profit organizations, and other educational institutions to amplify the impact of activism efforts. Such collaborations can enhance the university's ability to address complex social issues effectively and sustainably. Moreover, this study highlights the crucial role of universities in civil society, offering valuable insights for policymakers.

Originality of the paper. Grounded in two relevant and strongly interesting literature fields - public engagement and brand activism - this research seems to be pioneering in its investigation of university activism. To the best of our knowledge, this is the first study to intercept a phenomenon already in progress but not yet understood within the scholarly community.

Thus, the present research identifies university activism as a new social role for higher education, aimed to drive social change. By providing a first definition of university activism and identifying its key factors, this research lays the groundwork for a deeper understanding of this evolving phenomenon and posit itself as a practical guide for both future researchers and universities seeking to understand and implement this novel strategy.

Key words. university activism, social change, content analysis, strategic communication, institutional websites

L'integrazione del Metaverso negli eventi: impatto sugli SDG's e prospettive future

FRANCESCA IGINI¹ ARTURO CAFARO² MARIO CALABRESE³

Abstract

L'articolo esplora le molteplici implicazioni dell'integrazione degli strumenti digitali e del metaverso negli eventi, con un focus specifico sul caso del Phygital Sustainability Expo. Il metaverso, rappresentando un'evoluzione innovativa di Internet, ha un notevole potenziale per promuovere gli Obiettivi di Sviluppo Sostenibile (SDG's) in diversi settori. Attraverso un'osservazione basata sull'analisi della letteratura, questa ricerca analizza l'impatto dell'utilizzo del metaverso negli eventi sugli Obiettivi di Sviluppo Sostenibile (SDG's), incluse le partnership, l'educazione inclusiva e le azioni per mitigare l'impatto climatico. Inoltre, viene utilizzato un approccio predittivo mediante interpolazione lineare, per misurare quanto l'utilizzo di tool digitali e del metaverso possano influenzare l'entità dell'evento in futuro. I risultati contribuiscono a colmare le lacune nel dibattito accademico attuale riguardo all'intersezione del metaverso con la sostenibilità, offrendo spunti pratici per le imprese che si muovono in questo mondo ancora in evoluzione.

Key words: Metaverso; SDG; Eventi; Moda

Framing of the research. *Il metaverso rappresenta una vasta rete interattiva di mondi virtualizzati tridimensionali in tempo reale. Facilita l'interazione simultanea e duratura di un numero infinito di utenti, contraddistinta da una sensazione personale di presenza e da flussi continui di dati, che comprendono identità, storie, diritti, oggetti, comunicazioni e transazioni finanziarie (Ball, 2022). Questa tecnologia rappresenta una nuova iterazione di Internet che incorpora visori di realtà virtuale (VR), tecnologia blockchain e avatar volti ad integrare il mondo fisico e quello virtuale (Lee et al., 2021). Inoltre, questo mondo virtuale rappresenta un mercato in forte espansione. In particolare, l'analisi elaborata da Stata, indica una notevole traiettoria di crescita per il mercato del metaverso, proiettando un valore di 74,4 miliardi di dollari nel 2024 e un tasso di crescita annuale previsto (CAGR 2024-2030) del 37,73%. Questa traiettoria è prevista culminare in un volume di mercato previsto di 507,8 miliardi di dollari entro il 2030 (STATA, 2023).*

Alla luce del forte impatto che il metaverso ha apportato, la ricerca contemporanea, si sta concentrando sempre di più su di esso (Jauhiainen et al., 2022). Ad esempio, l'integrazione del metaverso nelle esperienze di shopping rappresenta una tendenza attuale nell'ambito della ricerca. I rivenditori stanno impiegando tecnologie avanzate, quali la realtà virtuale (VR), la realtà aumentata (AR) e la blockchain, per creare ambienti di shopping immersivi e interattivi. Queste soluzioni tecnologiche consentono ai consumatori di effettuare acquisti comodamente da casa o dall'ufficio, esplorando negozi virtuali attraverso l'uso di smartphone (Cannavo & Lamberti, 2020). Inoltre, grazie alla loro presenza nel metaverso, i rivenditori hanno la possibilità di entrare in possesso di informazioni sensibili sui clienti che risultano inaccessibili su altre piattaforme digitali (Vittorio, 2022), ciò consentirebbe di raggiungere un livello di personalizzazione dei prodotti che, conseguentemente, porterebbe ad un cambio di paradigma. È plausibile che nel prossimo futuro si verifichi un cambio paradigmatico, con il passaggio da un modello di "shop then ship" a uno di "ship then shop" (Choi et al. 2021), reso possibile grazie all'utilizzo di algoritmi avanzati in grado di interpretare con sempre maggiore precisione i bisogni e i desideri dei consumatori (Agrawal et al., 2018). Il metaverso, dunque, apre le porte alla personalizzazione delle esperienze dei clienti, tale caratteristica consente agli individui di modellare le loro esperienze in modo unico e coinvolgente, contribuendo a costruire connessioni più profonde con l'ambiente virtuale e con altri utenti (Dincelli, 2022; Le Tan et al., 2023). Questa modalità di acquisto si distingue per la sua sofisticata interattività e personalizzazione, offrendo un'esperienza immersiva senza precedenti. Tale interattività non solo rinforza il legame tra cliente e brand (Yoo et al, 2023), ma, inoltre, i commercianti possono capitalizzare sulla dimensione spaziale del metaverso, operando contemporaneamente in tre ambienti distinti, con potenziali benefici nella riduzione della dipendenza dai negozi fisici e dei relativi costi associati (Bourlakis et al., 2023). Attualmente, la ricerca presenta una

³ Sapienza Università di Roma
e-mail: mario.calabrese@uniroma1.it

lacuna in questo campo che, dato il cambio di paradigma e i molteplici benefici, meriterebbe un'attenzione più approfondita.

Numerose indagini accademiche, invece, si sono immerse nelle opportunità offerte dal Metaverso nel mitigare gli impatti ambientali e favorire la sostenibilità. Ad esempio, la tecnologia blockchain è identificata come fondamentale per affrontare le sfide legate al commercio, sebbene con il rischio di un notevole consumo energetico (De Giovanni, 2023). Nonostante ciò, viene sottolineato il potenziale trasformativo della tecnologia del Metaverso, suggerendo che esso ricopra un ruolo significativo nell'accelerare il raggiungimento degli Obiettivi di Sviluppo Sostenibile (Cao et al., 2023). La capacità distintiva del Metaverso di stabilire un'interconnessione senza soluzione di continuità tra la vita reale e virtuale emerge come un catalizzatore per ridurre il consumo di risorse nella produzione di beni e prodotti (Allam, 2022). Inoltre, esso permette di ridurre le attività quotidiane che richiedono l'utilizzo di mezzi di trasporto (Kshetri, 2023), e di minimizzare il consumo di energia negli edifici adibiti ad uffici (Vlăduțescu et al., 2023; Al-Emran, 2023).

Pertanto, il Metaverso, come spazio digitale in crescita, offre un'opportunità distintiva di allinearsi agli Obiettivi di Sviluppo Sostenibile, che risulta particolarmente evidente nel campo degli eventi. Questa tecnologia aiuta gli organizzatori di eventi a seguire linee guida aziendali, sociali ed ambientali, riducendo le emissioni di carbonio legate ai viaggi e al catering, promuovendo l'educazione ambientale, la consapevolezza e un comportamento responsabile (Kark & Singh, 2023). Inoltre, gli eventi nel Metaverso vanno oltre le tipiche riunioni virtuali, evolvendosi in occasioni curate su piattaforme dedicate. Questo cambiamento trasformativo, che si discosta dagli eventi virtuali tradizionali, mostra una forte capacità di offrire esperienze sempre più coinvolgenti (Piccioni, 2023). Anche le tecnologie della moda e del retail stanno avanzando in un'ottica sempre più digitale, coinvolgendo i consumatori attraverso il metaverso dando vita ad un ambiente commerciale omnicanale (Weiss, 2022). Anche i marchi di moda stanno sfruttando questi sviluppi per ospitare le proprie sfilate all'interno del metaverso, presentando così i loro design ad un pubblico globale (Mu et al., 2023). Nel 2022, nel periodo post pandemico, i grandi brand globali della moda hanno partecipato alla Metaverse Fashion week organizzata in collaborazione con Decentraland (STATA, 2022). Questo spostamento verso il mondo virtuale però non rappresenta solo una risposta alla pandemia, ma è una tendenza in continua evoluzione. Dopo la pandemia, infatti, le tradizionali settimane della moda si stanno trasformando in settimane della moda digitali, con un impatto significativo sulla portata del pubblico, sui costi operativi e sull'interazione con i consumatori (Dai, 2023). Di fatto, l'applicazione della tecnologia del metaverso risulta particolarmente rilevante nell'industria della moda, dove il raggiungimento della sostenibilità richiede una profonda trasformazione digitale (Periyasamy & Periyasami, 2023). Infatti, questo settore contribuisce significativamente alle sfide ambientali, rappresentando il secondo settore maggiormente inquinante globale dopo l'industria petrolifera, portando a varie conseguenze ambientali negative (Gupta et al., 2022; Raj et al., 2022). L'influenza di tale industria si estende su diversi settori, influenzando in modo significativo i diritti umani, le emissioni di carbonio, il consumo di acqua, l'inquinamento e le disuguaglianze di genere (Ali et al., 2022). Le sfilate di moda svolte nel metaverso migliorano l'accessibilità globale, eliminano i costi legati agli eventi fisici e contribuiscono alla sostenibilità riducendo le impronte di carbonio (Dewalska-Opitek, 2023). Ciò sottolinea la crescente importanza del metaverso come forza trasformativa, in particolare nel settore della moda, allineandosi con gli obiettivi più ampi di sostenibilità.

Purpose of the paper. Gli avanzamenti del metaverso enfatizzano l'importanza di integrare la sostenibilità e la responsabilità ma la discussione accademica in questo campo rimane incompleta (Jauhainen et al., 2022). L'attuale conversazione accademica manca di approfondimenti esaustivi sulle conseguenze ambientali del consumo virtuale sia in positivo, che in negativo (Pellegrino et al., 2023). Inoltre, la comprensione accademica del metaverso nel contesto della moda rimane ambigua, indicando una lacuna nella comprensione accademica (Lee et al., 2022).

Tale ricerca mira a colmare questo gap. Attraverso un esame dell'aspetto online Phygital Sustainability Expo, il nostro studio cerca di scoprire approfondimenti legati agli effetti e alla rilevanza dell'uso del metaverso come strumento per eventi digitali, con un focus specifico sulla sostenibilità. Adottando questo approccio, il nostro studio mira non solo a contribuire alla discussione specifica sul Metaverso, ma anche a migliorare la comprensione accademica più ampia delle varie implicazioni degli eventi digitali in contesti diversi. Per raggiungere questo obiettivo, sono state formulate due domande di ricerca:

RQ 1: Come l'uso del metaverso negli eventi influisce sul raggiungimento degli SDG's?

RQ 2: Quanto influisce l'uso di strumenti digitali e del metaverso sul numero di partecipanti, e quanto influenzerà in futuro?

Methodology. Nella fase iniziale, viene esaminata la letteratura per chiarire le implicazioni del metaverso negli eventi sugli Obiettivi di Sviluppo Sostenibile (SDGs) attraverso un'osservazione concettuale (Joseph, 2023). Lo studio analizza la letteratura per comprendere l'impatto degli eventi su specifici SDGs e valutare il contributo potenziale del metaverso al loro raggiungimento.

Inoltre, questo lavoro adotta un approccio focalizzato, concentrando l'analisi su un singolo case study con lo scopo approfondire le complessità di una specifica problematica in contesti distinti (Sandars, 2021). L'attenzione è rivolta al "Phygital Sustainability Expo," una rilevante esposizione sulla sostenibilità nel settore della moda e del design, attualmente alla sua quarta edizione nel 2023 presso i Fori Imperiali di Roma.

Tab. 1: elaborazione degli autori sulla base dei dati forniti dalla Sustainable Fashion Innovation Society

REACH RECAP - PHIGITAL SUSTAINABILITY EXPO 2023				
REACH TOTALE	70.000.000	ONLINE	43.000.000	80%
		OFFLINE	27.000.000	20%

Al fine di comprendere l'impatto che l'uso del digitale e del metaverso ha avuto e avrà in futuro sul numero di partecipanti all'evento preso in esame, è stata svolta una previsione mediante interpolazione lineare. Il meccanismo predittivo dell'interpolazione lineare si basa sul principio di utilizzare i valori associati ai punti dati noti per estrapolare e stimare il valore corrispondente a un punto dati sconosciuto (Pownuk & Kreinovich, 2017). La sequenza procedurale implica il reperimento dell'equazione lineare che racchiude le dinamiche relazionali tra i punti dati stabiliti, successivamente utilizzando questa equazione derivata per estrapolare e calcolare il valore assegnato al punto sconosciuto (Dyba & Hakulinen, 2000). Dato l'inizio recente di questo evento, il dataset a nostra disposizione copre un periodo relativamente breve, comprendente un quadriennio dal 2020 al 2023. I risultati, quindi, rappresentano un'approssimazione che potrebbe essere implementata su un arco temporale più ampio. Per prevedere la tendenza dei partecipanti agli eventi in streaming per l'anno 2024, è stata effettuata un'interpolazione lineare manuale utilizzando i dati delle prime quattro edizioni dell'evento (2020, 2021, 2022 e 2023). Questo approccio ha stabilito una relazione lineare tra l'anno e i valori associati, che è stata poi utilizzata per prevedere il numero di partecipanti per il 2024.

Results. La RQ1 ha lo scopo di comprendere come l'integrazione del metaverso negli eventi influisca sul raggiungimento degli Obiettivi di Sviluppo Sostenibile (SDG's), rivelando un potenziale trasformativo nello sviluppo sostenibile. L'utilizzo di un'osservazione basata su concetti fornisce una comprensione completa dell'argomento. La ricerca sulla pianificazione degli eventi si concentra su tre Obiettivi di Sviluppo Sostenibile chiave: SDG 17 (Partnership), SDG 4 (Educazione) e SDG 13 (Azione per il Clima) (Fiorani & Di Gerio 2018; Liu & Lei 2021; Di Gerio et al. 2020; Mackay et al. 2023). L'indagine si è estesa per analizzare la letteratura in merito agli specifici Obiettivi di Sviluppo Sostenibile (SDG's) in connessione con il Metaverso. L'esplorazione è stata condotta utilizzando il dataset di Scopus. La query di ricerca impiegata per questa revisione della letteratura è stata: TITLE-ABS-KEY (metaverse) AND (impact) AND (sustainable AND development AND goals) OR (sdg*). Il risultato di questa ricerca ha prodotto un totale di 102 documenti. I filtri applicati per questa ricerca sono stati: Tipo di documento "Articolo"; Stato di pubblicazione "Finale"; Lingua "Inglese", e la ricerca è stata limitata a tutti gli Open Access. Dato che questo è, come esplicitamente dichiarato, un argomento emergente, durante il processo di ricerca non sono state imposte restrizioni temporali. Il numero di documenti trovati è risultato 57. Successivamente, è stato eseguito uno screening. Sono stati trovati 12 articoli correlati all'effetto del metaverso sugli SDG's 4; 17 e 13. Gli articoli si concentrano principalmente sulla relazione tra Metaverso ed Educazione e Metaverso e Sostenibilità.

Con riferimenrto all'SDG4, si prevede che il metaverso sia cruciale nell'integrare nuove tecnologie nell'istruzione (Jamshidi et al., 2023). Çelik & Baturay (2024) hanno riscontrato impatti positivi sui risultati di apprendimento del sottolineando le caratteristiche immersive e interattive del metaverso. Park & Kim (2022) ne sottolineano il potenziale nel superare vincoli temporali e spaziali nell'istruzione, fornendo pari opportunità e affrontando limitazioni fisiche. Hassani et al. (2022) enfatizzano l'impatto positivo sulle esperienze di apprendimento e sull'accesso equo alle risorse,

eliminando le barriere legate a posizione, lingua e disabilità. Qadir & Fatah (2023) sottolineano il potenziale del metaverso nel migliorare l'apprendimento a distanza attraverso una collaborazione efficace e ambienti virtuali condivisi.

Sfruttando le intuizioni derivate dagli studi sopra menzionati, il metaverso emerge non solo come una forza trasformativa nell'istruzione, ma anche come una piattaforma versatile capace di ospitare eventi diversificati, dalla promozione a eventi culturali, artistici, sportivi e festival. Nell'istruzione, il metaverso offre esperienze di apprendimento immersive e interattive che, quando utilizzate in un evento, possono garantire la diffusione della conoscenza a un vasto pubblico. Questo approccio completo mira a migliorare l'accessibilità e l'interesse affrontando le diverse esigenze del pubblico.

Nel contesto dell'SDG 17 il metaverso funge da piattaforma innovativa per ospitare eventi virtuali, offrendo esperienze immersive e interattive che favoriscono un pubblico più ampio e promuovono collaborazioni tra diverse parti interessate (De Giovanni, 2023). D'altro canto, l'indagine condotta da Chen & Huang ha rivelato che l'ambiente virtuale all'interno del metaverso incoraggia una stretta vicinanza spaziale e fornisce un riscontro multisensoriale, sviluppando risposte emotive durante le interazioni e la condivisione di conoscenze. Queste caratteristiche migliorano l'influenza reciproca e contribuiscono a mitigare i rischi di cooperazione percepiti.

Sulla base di queste conclusioni, le interazioni all'interno del metaverso sono identificate come un catalizzatore per la creazione di nuovi partenariati e collaborazioni. Il metaverso, attraverso le sue caratteristiche immersive e collaborative, emerge come un potente strumento, utilizzabile negli eventi, per favorire sinergie tra diverse parti interessate, promuovendo così sforzi collettivi verso lo sviluppo sostenibile.

Per quanto riguarda l'SDG 13, la tecnologia digitale, come sottolineato da Cao et al. (2023), contribuisce significativamente all'ottimizzazione della produzione e delle operazioni aziendali per obiettivi neutri in carbonio e per gli obiettivi di sviluppo sostenibile verdi. Pachouri et al. (2024) sottolineano il ruolo dei metodi digitalizzati dell'Industria 4.0 nell'ottimizzare l'ambiente costruito per la sostenibilità. Jauhiainen et al. (2022) si concentrano sul Metaverso, evidenziandone il potenziale nel ridurre le emissioni di carbonio sostituendo beni fisici con equivalenti digitali e ottimizzando il mondo fisico attraverso simulazioni e un maggiore livello di consapevolezza. Dwivedi et al. (2022) e Joseph (2023) sottolineano entrambi il ruolo del metaverso nel ridurre l'impronta di carbonio attraverso la diminuzione dei viaggi, la promozione dell'efficienza lavorativa e la facilitazione della replicazione di edifici e città per un impatto ecologico positivo.

L'influenza trasformativa della tecnologia digitale e del metaverso si estende oltre l'ottimizzazione dei processi industriali, abbracciando una rivoluzione nel modo in cui eventi e interazioni sono condotti. Questo cambiamento di paradigma, particolarmente applicabile alle attività legate ai viaggi, ha il potenziale di ridurre significativamente le impronte ambientali. Il metaverso, con la sua capacità di replicare spazi fisici e consentire interazioni virtuali, emerge come un attore chiave nel mitigare l'impatto ambientale tradizionalmente associato ai viaggi. Offrendo alternative a incontri fisici, eventi e visite turistiche, queste tecnologie aprono la strada a un approccio più sostenibile alle interazioni umane, allineandosi all'imperativo di ridurre le emissioni di carbonio e promuovere la responsabilità ecologica.

Per affrontare la RQ. 2, è stata eseguita un'interpolazione lineare con l'obiettivo di comprendere la tendenza e prevedere il numero futuro di partecipanti online alla Phygital Sustainability Expo, al fine di comprendere l'impatto (attuale e futuro) dell'uso di strumenti digitali e del metaverso.

Per offrire una maggiore comprensione del caso di studio analizzato, sono state effettuate delle analisi preliminari attraverso i dati forniti dall'ente organizzatore dell'evento. I dati sulla portata totale rappresentano la complessità degli utenti raggiunti dal Phygital Sustainability expo attraverso le strategie di comunicazione implementate utilizzando diversi canali, azioni e strumenti sia online che offline.

Tab. 3: elaborazione degli autori sulla base dei dati forniti dalla Sustainable Fashion Innovation Society

Canali digitali	Azioni	Tod	Reach Totale
Paid media campaign	Impressions Reach Likes Shares and nuovi followers	Meta Instagram LinkedIn	2.000.000
Influencer marketing	90 influencer/opinion leader internazionali intersettoriali	Kaby Lane José Mourinho Agil Mamyyev	18.000.000
Articoli online dei principali partner istituzionali	I principali partner hanno dedicato spazi sui loro siti web ufficiali	Fao Poste Italiane European Commission European Parliament Italian Trade Agency Italian Ministry of Foreign affairs Rome Capital City Ferrovie dello Stato Lega di calcio serie B Enel CNH industrial	10.000.000
Media Partners	Programmi televisivi in prima serata sull'evento Streaming integrale dell'evento Streaming della conferenza stampa dell'evento	Rai Today.it Forbes	15.000.000
Social media Marketing	Grande visibilità per tutti i partner sui canali ufficiali	Instagram LinkedIn Facebook	30.000

Tab. 4: elaborazione degli autori sulla base dei dati forniti dalla Sustainable Fashion Innovation Society

Canali Offline	Azioni	Tool	Reach totale
Print media	Articoli di giornale	Corriere della sera Milano Finanza Repubblica Libero La Stampa Il Messaggero Il Giornale Forbes Fortune	15.000.000
Out of home ADS	1 Ledwall in Times Square a New York Poster dell'evento sugli autobus della città di Roma 10 Ledwall a Roma e Milano Cartelloni dell'evento su tutti i treni nazionali	Nasdaq ATAC Urban Vision Ferrovie dello stato	12.000.000

Per comprendere meglio l'entità dell'evento, è stata generata una panoramica dei paesi di origine dei partecipanti fisici. L'evento analizzato, di portata globale, sottolinea la necessità di comprendere l'impatto dell'adozione di strumenti digitali e del metaverso e le sue implicazioni future. Questa valutazione è cruciale, data la sua duplice influenza del digitale nella riduzione dei fattori legati ai viaggi e nell'espansione dell'audience raggiunta.

Tab. 5: elaborazione degli autori sulla base dei dati forniti dalla Sustainable Fashion Innovation Society

Divisione per paese di provenienza dei partecipanti in presenza			
15.000 partecipanti			
		Italia	85%
Europa	76%	Paesi Bassi	5%
		Resto dell'Europa	10%
USA	12%		
America Latina	9%		
Altre nazioni	3%		

Successivamente, è stata svolta l'analisi predittiva utilizzando il metodo di interpolazione lineare utilizzando i dati concernenti le presenze in streaming dell'evento durante gli anni in cui esso si è svolto.

Tab. 6: elaborazione degli autori sulla base dei dati forniti dalla Sustainable Fashion Innovation Society

Anno	N. partecipanti in streaming
2020	1.000
2021	5.000
2022	10.000
2023	42.000

Fig. 1: elaborazione degli autori

Il numero stimato di partecipanti online per l'anno 2024 ammonta a circa 46.500 individui, riflettendo una previsione analitica della partecipazione del pubblico nel mondo virtuale dell'evento. Il coefficiente di determinazione, R^2 , misura la bontà di adattamento del modello lineare ai dati (Dyn et al, 1990). Varia da 0 a 1, dove 1 indica un adattamento perfetto. In questo caso, $R^2=0.877$, il che significa che circa l'87,7% della variabilità nei valori previsti (basati sul modello lineare) può essere spiegato dalla relazione lineare con l'anno. È importante sottolineare, però, che tali dati rappresentano un'approssimazione e un dataset più ampio fornirebbe una percezione migliore della situazione, considerando l'attuale insieme di dati limitato. Inoltre, viene riscontrato un forte aumento delle presenze tra il 2022 e il 2023, quando, per la prima volta, il metaverso è stato utilizzato nell'evento per presentare la "sfilata di moda narrata" online.

Research limitations. I limiti di questo lavoro includono la focalizzazione su uno specifico caso di studio, il che suggerisce la possibilità di una futura espansione della ricerca per includere una gamma più ampia di eventi in settori diversi. Inoltre, le limitazioni derivano dal breve periodo temporale del dataset, poiché l'evento in analisi è in corso solo da pochi anni. Si riconosce la necessità di estendere l'analisi a eventi con dati che coprano un arco temporale più ampio per fornire ulteriori approfondimenti. Inoltre, lo stato attuale del discorso accademico rimane incompleto, e ulteriori indagini sono necessarie per comprendere le implicazioni del metaverso sullo Sviluppo sostenibile. Questa lacuna fornisce uno spazio opportuno per ulteriori ricerche che offrano preziosi approfondimenti specificamente progettati per brand e associazioni che si avventurano nel fiorente mondo del metaverso.

Managerial implications. Da un'analisi della letteratura è emerso che l'utilizzo del metaverso come canale di vendita ridefinisce il retail, consentendo transazioni dirette all'interno di ambienti virtuali e trasformando il semplice atto dello shopping in un'esperienza coinvolgente e dinamica. Un aspetto cruciale di questa rivoluzione è l'impiego avanzato dei dati. Grazie all'analisi dei dati, lo shopping virtuale può offrire una personalizzazione su misura, presentando prodotti pertinenti e stabilendo un collegamento diretto tra cliente e merce. In questo scenario, il metaverso sta ridefinendo il concetto di shopping online, aprendo nuove opportunità per i rivenditori di creare esperienze uniche e coinvolgenti per i consumatori mitigando i costi operativi dovuti agli store fisici. Le imprese dovrebbero progressivamente orientarsi verso l'omnicanalità, incorporando il metaverso nelle proprie strategie. Tale approccio non solo comporterebbe vantaggi nella gestione delle relazioni con i consumatori, ma anche in termini di contenimento dei costi.

Lo studio suggerisce implicazioni brand, organizzazioni e policy maker, evidenziando il ruolo del metaverso nell'integrare principi di sostenibilità negli ambienti virtuali e nel raggiungere obiettivi di sostenibilità. Tale lavoro evidenzia come il metaverso sia uno strumento dinamico in grado di ridefinire gli eventi, coinvolgere pubblici diversificati e contribuire a un futuro più sostenibile. Infatti, la vasta portata che tale tecnologia svolge un ruolo cruciale nella diffusione della conoscenza e il suo utilizzo in eventi legati alla sostenibilità, come il Phygital Sustainability Expo, promuoverebbe la sensibilizzazione tra un gran numero di persone. Il metaverso, utilizzato negli eventi, emerge anche come uno strumento volto a favorire sinergie tra diverse parti interessate. Attraverso l'uso delle nuove tecnologie, come dimostrato, possono essere generate collaborazioni tra diverse aziende e tra aziende e istituzioni durante gli eventi, facilitando l'avvio di cambiamenti in una direzione sempre più sostenibile. Il metaverso, replicando spazi fisici e consentendo interazioni virtuali, svolge un ruolo cruciale nel ridurre l'impronta ambientale associato ai viaggi fornendo alternative a incontri ed eventi in presenza. Dunque, l'utilizzo del metaverso rappresenta per le imprese un'occasione unica per progredire verso gli Obiettivi di Sviluppo dell'Agenda 2030.

Originality of the paper. L'originalità di tale lavoro risiede nell'approccio innovativo proposto nel contesto della sostenibilità e della gestione degli eventi, focalizzandosi sull'esplorazione delle implicazioni derivanti dall'integrazione del metaverso negli eventi, con una particolare attenzione rivolta al Phygital Sustainability Expo nel settore della moda.

La ricerca si propone di colmare lacune presenti nel dibattito accademico corrente che riguarda l'intersezione del metaverso con la sostenibilità, offrendo spunti pratici e pragmatici per le imprese che si muovono in questo panorama ancora in evoluzione. L'analisi dei risultati mira a fornire una base di conoscenza solida e informativa, in grado di guidare le decisioni strategiche nel contesto dell'integrazione del metaverso negli eventi, con particolare riferimento alla sostenibilità nel settore della moda.

Questo approccio multidisciplinare si inserisce in un contesto accademico che spesso si è concentrato su aspetti specifici del metaverso o della sostenibilità, ma raramente ha esplorato in dettaglio la loro intersezione. Attraverso la metodologia predittiva adottata, il paper contribuisce a proiettare l'attenzione al di là del presente, offrendo una visione prospettica sull'evoluzione futura di eventi sostenibili supportati dal metaverso.

L'articolo aspira a non solo ampliare la comprensione accademica dell'impatto del metaverso sugli obiettivi di sviluppo sostenibile, ma anche a fornire suggerimenti tangibili per le aziende e le organizzazioni che mirano a incorporare questa innovazione nella pianificazione e nell'esecuzione degli eventi. L'originalità e la rilevanza di questo contributo accademico risiedono, quindi, nell'approccio pionieristico, nella sua natura interdisciplinare e nella sua capacità di tradurre concetti complessi in indicazioni pratiche, alimentando così la discussione e la prassi nel campo in continua evoluzione del metaverso e della sostenibilità degli eventi.

The impact of sustainability and country-of-origin on consumers' willingness-to-pay for a brand: A conceptual framework

CHIARA SCRIMIERI¹ ADAMANTIOS DIAMANTOPOULOS² MICHELA MATARAZZO³
ALBERTO PASTORE⁴

Abstract

The influence of country-of-origin (COO) and sustainability cues on consumers' willingness-to-pay (WTP) for sustainable products has not been fully elucidated in extant literature. This paper proposes a new conceptual framework for understanding how a brand's COO and sustainability information affect consumers' WTP for the focal brand, drawing on three well-established theories in the fields of marketing and psychology: cue utilization theory, signaling theory and attribution theory.

Key words: Sustainability; country-of-origin; willingness-to-pay; conceptual framework.

Framing of the research. *In this study we seek to enhance our conceptual understanding how the country-of-origin (COO) of a brand and information about the latter's sustainability impact consumers' willingness-to-pay (WTP) for the focal brand. COO, namely "the country which a consumer associates with a product or brand as being its source, regardless of where the product is actually produced" (Jaffe and Nebenzahl, 2006, p.29) has been found to influence consumers' evaluations of sustainable products (Dekhili and Nguyen, 2021). However, while it is known that country green/environmental image (Chan, 2000; Dekhili et al., 2021) and COO sustainability reputation (Cowan and Guzman, 2020) have an impact on sustainable product attributes in consumer decision making (Brand and Rausch, 2021), it is unclear exactly how COO influences WTP in the presence versus absence of sustainability cues.*

Extant literature specifically focusing on the interplay between COO and sustainability with explicit focus on WTP as an outcome variable is both sparse and (highly) contradictory. For example, Magnusson et al. (2015) found that consumers perceive corporate social responsibility (CSR) initiatives significantly more positively when they are associated with countries that have a strong environmental reputation. In turn, this positive perception leads to a higher WTP for the products or services offered by these firms. However, this effect was not observed in the study by Dekhili and Achabou (2015) who found that, while a favorable COO image has no impact on the WTP for an eco-labeled product, an unfavorable COO image has a negative impact on the WTP for the product. A more recent study by Montanari et al., 2023 supported Dekhili and Achabou (2015) findings in the case of a favorable COO image (i.e., no effect on WTP) but found completely the opposite in the case of a less favorable COO image; WTP actually increased for the sustainable product when associated with the weaker COO.

In short, the literature shows that the simultaneous presence of COO and sustainability stimuli can affect consumers' WTP. Nonetheless, how the relationship between COO and sustainability impacts consumers' WTP remains ambiguous and unclear. This is an important question since WTP denotes the maximum price a consumer is willing to spend on a product or service, through a trade-off between perceived benefits and costs (Homburg et al., 2005; Koschate-Fischer et al., 2012) and is, therefore, of substantial managerial relevance for the development of pricing strategies (Miller et al., 2017; Wertenbroch and Skiera, 2002; Yuen et al., 2016) and the competitive positioning of companies. Although there is evidence indicating an increasing consumer inclination towards sustainable products and services (Elhoushy and Lanzini, 2021; Paul et al., 2016; Rosenbaum et al., 2022), several researchers have highlighted a discrepancy between the significance customers claim to assign to sustainability and their actual buying decisions (Narayanan and Singh, 2023; Barbarossa and Pastore, 2015). This disparity between consumer attitudes and behavior is widely acknowledged in the consumer behavior and social psychology literature (Carrigan and Attala, 2001; Roberts, 1996; Abraham and Sheeran, 2003), however, it is particularly relevant in the context of sustainable consumption since "sustainability attributes do not always drive consumer choice, even when consumers value sustainability positively" (Bangsa and

Schlegelmilch, 2020, p.2). Put simply, consumers may well display positive attitudes toward sustainable products but may not be willing to bear additional costs to obtain them.

Purpose of the paper and methodology. We propose a conceptual framework to elucidate the potential responses of consumers in terms of WTP when a brand is associated with either a strong or a weak COO in the presence and absence of sustainability information (e.g., an eco-label). In doing so, we draw on three well-established theories in the fields of marketing and psychology: cue utilization theory (Jacoby and Haddock, 1971; Olson, 1972; Olson and Jacoby, 1972), signaling theory (Erdem and Swait, 1998; Erdem et al., 2006; Erdem and Swait, 2016), and attribution theory (Heider, 1958; Kelley and Michela, 1980; Folkes, 1988).

Our framework initially distinguishes between two main settings based on the brand's COO (strong vs. weak) and subsequently considers two conditions regarding sustainability information relating to the focal brand (presence vs. absence). This results in a total of four scenarios to which a consumer might be exposed, each of which results in different interpretations as to whether the brand in question is sustainable or not. Such interpretations together with consumers' attributions regarding who should carry the cost of sustainability will then determine WTP. Figure 1 graphically describes our framework; we discuss its logic and relevant pathways in the section that follows.

Figure 1. Proposed conceptual framework.

Source: own elaboration.

Results. According to signaling theory (Erdem and Swait, 1998), companies convey information about their specific attributes, such as their reputation and product features, to gain a competitive advantage; consumers examine these signals when making purchasing decisions (Erdem et al., 2006). In this context, according with cue utilization theory that provides a valid framework for evaluating consumer reactions to different product attributes (Richardson et al., 1994), COO is an extrinsic cue that acts as a signal and influences consumer responses (Lu et al., 2016; Chao 1993). Similarly, sustainability labels are extrinsic cues used by consumers when deciding on sustainable products (Lee et al., 2020). Consistent with the triple bottom-line notion of sustainability (Elkington, 1997), such labels may convey information about environmental sustainability (e.g., carbon footprint), social sustainability (e.g., absence of animal testing) or economic sustainability (e.g., fair trade).

When a brand carries a sustainability label and originates in a country with a strong image, it is more likely that the brand will be perceived as being sustainable as the sustainability cue is more credible. In other words, the consumer is confronted with two consistent positive signals, whereby the COO cue reinforces the sustainability cue. However, in the case of a strong COO, the absence of a sustainability cue does not necessary mean that the consumer will conclude that the brand is not sustainable. This is because the consumer may assume that the brand is sustainable because it originates in a country with a strong COO. Put differently, the COO may act as a “halo” whereby consumer infer the brand’s

sustainability based on their beliefs regarding the country sustainability reputation (Cowan & Guzman, 2020). This possibility is shown in Figure 1 by the arrow from “No sustainability info” to “Product sustainable”.

The situation is very different when the focal brand originates in a weak COO. In this case, the presence of sustainability information (a positive signal) does not guarantee that the brand will be perceived to be sustainable. This is because consumers may not believe such information given that the brand’s COO is not strong; in other words, the sustainability information conveyed to consumers is not seen to be credible. This possibility is shown in Figure 1 by the arrow from “Sustainability info” to “Product not sustainable”.

From the above discussion, it becomes evident that COO and sustainability cues should not be considered separately, when they are factored into consumer decision making. As shown in Figure 1, perceptions about a brand’s sustainability are not solely formulated based on the presence of an explicit sustainability cue (e.g., an eco-label) but also implicitly influenced (either positively or negatively) by the brand’s COO.

Once consumers have interpreted the COO and sustainability signals and reached a conclusion about the brand’s sustainability (or lack of), the question arises how they will react in terms of their WTP. Based on signaling theory alone, the prediction would be that a brand perceived to be sustainable and originating in a strong COO (two positive signals), would result in the highest WTP. Conversely, a brand from a weak COO that is not perceived to be sustainable would lead to the lowest WTP. While this line of argument is intuitively appealing, it is also flawed because it fails to take into account a cognitive process commonly used by consumers known as attribution of responsibility (Folkes, 1984); the latter has a significant impact on pro-environmental behavior (Bamberg and Moeser 2007) and can, therefore, also potentially influence the WTP for sustainable products. Attribution refers to the cognitive process of perceiving or inferring the cause of a certain event or behavior (Kelley & Michela, 1980) and the subsequent inferences about the consequences (Folkes, 1988).

Attribution of responsibility has been widely investigated in the context of sustainability research to, for example, understand energy-saving behavior (Yue et al., 2023) or the selection of destinations that have social responsibility initiatives (Su et al., 2020). However, it has not been used to examine the specific locus of responsibility that individuals assign when making decisions about their WTP for sustainable products. A higher cost for a product can be linked to its sustainability (cause) due to consumers believing the explicit sustainability signals received or by assuming sustainability due to the halo effect of COO (see earlier discussion). The consequence is the decision to pay or not pay a higher price for the sustainable product and attribution of responsibility serves as a mediator between the intention to behave in a certain way and the actual behavior (Sun et al., 2022). In this context, consumers often attribute responsibility for sustainability costs to governments or companies rather than to themselves (Montanari et al., 2023), especially when it comes to brands from developed countries (i.e., strong COOs) for which governments provide funding for sustainability and incentivize companies to reduce their socio-environmental impact. Thus, according to attribution theory, consumers who feel personally responsible for sustainability costs are more likely to be willing to pay more for a sustainable product. Conversely, consumers’ WTP is likely to be lower if they attribute the costs of sustainability to others (such as governments, institutions, or companies). In short, the more an individual believes that the locus of responsibility for covering the (extra) cost of sustainability lies with consumers, the higher his/her WTP.

Explicitly taking into account the attribution of responsibility may well explain the lack of difference in WTP between sustainable and not sustainable product versions observed in prior studies (e.g., Narayanan and Singh, 2023). For example, referring to Figure 1, it becomes evident that while WTP (1) can - all other things being equal - be expected to exceed WTP (2), it is not necessarily the case that WTP (2) will be higher than WTP (3) despite the fact that WTP (2) is associated with a product perceived to be sustainable while WTP (3) is associated with a non-sustainable product. Analogous inferences can be drawn about the relationships among WTP (4), WTP (5) and WTP (6).

Some prior studies give the impression that consumers who receive information about sustainability immediately perceive the product or brand as being sustainable, as result of which they are willing to pay a higher price for it (e.g. Del Giudice et al., 2018). Our model questions this “automatic” process as it does not explicitly account either for the credibility of sustainability signals (which, as noted earlier, is a function of the brand’s COO) or for the attribution of responsibility by consumers. Indeed, the conflicting findings of prior empirical research on the simultaneous impact of COO and sustainability cues on WTP may well be due to the neglect of these two factors in the relevant research designs.

Research limitations. A key limitation of the current study - which is also an opportunity for further research - is the absence of empirical data to operationalize the proposed framework and reveal the magnitude of the differences in WTP associated with the different model pathways (i.e., WTP (1) - WTP (6) in Figure 1). Another limitation is the consideration only of a single COO notion (the brand origin) and the neglect of other potentially relevant origins, such as country of manufacture or country of design. A third limitation is the lack of attention to potential moderating variables (e.g., consumer skepticism, cause involvement, type of sustainability information) on the model linkages. The same applies to control variables (e.g. income or price sensitivity) that may also impact consumers’ WTP.

Managerial implications. Our conceptual framework is useful for international marketing managers who wish to capitalize on sustainability claims and COO associations when formulating their strategies for entering new markets and determining price positioning strategies. For example, comparing WTP (1) with WTP (3) and WTP (4) with WTP (6) should offer insights into the maximum gain that can be expected as result of sustainability efforts. Similarly, comparing WTP (1) with WTP (4) and WTP (3) with WTP (6) should reveal any WTP differentials due to COO differences.

Furthermore, comparing WTP (2) with WTP (3) and WTP (5) with WTP (6) should help managers determine whether the extra costs of sustainability are likely to be covered by consumers' higher WTP. Needless, to say, that for these comparisons to be of practical value, marketing research should be conducted in the specific product category of interest with the relevant brand origins as COO stimuli.

Finally, the proposed framework suggests that consumers may exhibit higher WTP due to their beliefs about the locus of sustainability responsibility. Therefore, managers can encourage consumers to buy sustainable products by appealing to their sense of personal responsibility as well as trying to stimulate it, for example, with sustainability awareness campaigns.

Originality of the paper. Our framework provides a new theoretical lens to the study on pro-environmental consumer behavior by specifically, examining the impact of sustainability and the COO cues on consumers' WTP and highlighting the close interdependence of these cues. The novelty of the proposed framework lies in the explicit consideration of the credibility of the information associated with these cues as well as the attribution of responsibility aspect that has hitherto not been taken into account in prior research on the sustainability-WTP link.

Conceptualizing perceptions of the institutionally derived ‘maneuverable space’ for value (co)creation

JIMMIE RÖNDELL¹ PETER EKMAN²

Framing of the research. *Understanding how to successfully identify, generate, and offer resources to customers and other stakeholders is essential for any business enterprise. This process involves attending to the ever-changing needs of customers, which are influenced by shifts in market regulations, cultural practices, and cognitive frameworks. These institutional arrangements shape and are shaped by business and societal behavior, affecting perceptions of the available solution space, which refers to the boundaries of resource integration for generating solutions.*

Continuous evaluation and reevaluation of activities and resources in relation to the business landscape are crucial for enterprises to adapt to the market environment, often described as a service ecosystem. Conceptual frameworks provide a roadmap for navigating this changing terrain, enabling businesses to cope with incremental or radical changes by understanding market dynamics and innovating new resource combinations to address customer needs.

In recent years, there has been growing interest in incorporating institutional aspects into theoretical developments of markets as ecosystems, where value creation is seen as a co-creative process involving the integration of resources from various actors. However, there remains a need for further research on how institutional elements shape value co-creation processes and market dynamics. Incorporating institutional elements into market theories is essential because regulatory, normative, and cognitive rules influence resource integration and shape market behaviors. These elements are fundamental for understanding market changes and innovation diffusion, as they both enable and constrain how resources are accessed and integrated, thereby affecting the perceived value of solutions.

Business enterprises must understand how to effectively identify, generate, and offer resources to customers while navigating changing institutional arrangements in markets. Institutional elements, such as regulations, norms, and cognitive frameworks, shape market behavior and influence the perceived ‘solution space’ (the potential and experiences value) for resource integration. Recent research emphasizes integrating institutional aspects into theoretical frameworks to comprehend value co-creation processes.

Purpose of the paper. *To move beyond traditional views of value-added transactions towards understanding value-in-use from resource integration, this paper introduces the concept of the institutional solution space. This concept focuses on how institutional arrangements enable or limit the potential solution space for resource integration activities, deepening our understanding of value generation through actor-generated institutions. Drawing on a case study of the music industry's digitalization and market transformation, this paper illustrates the concept of the institutional solution space in practice. It proposes pathways for mid-range theory developments on market change and the role of institutions in shaping markets as ecosystems, complementing recent research on market innovation and emergence. Viewing markets as ecological networks of organized behavior systems, marketing activities involve the integration and recombination of resources to solve specific problems and meet customer needs. The accessibility and utilization of resources affect the potential and perceived value of solutions, known as the solution space, which is influenced by institutional arrangements.*

Institutional elements, including regulatory, normative, and cultural/cognitive aspects, enable and constrain value co-creation processes by shaping actor interactions and resource integration. Understanding the dynamic nature of institutional logics and shared arrangements is essential for grasping the contextual dimension of resource integration and value creation.

In conclusion, the concept of the institutional solution space offers a framework for understanding how institutional arrangements influence resource integration and value co-creation in markets. By considering regulatory, normative, and cultural/cognitive aspects, businesses can better navigate the evolving market landscape and innovate to meet changing customer needs.

Methodology. *The paper is primarily conceptual in nature, we do however rapport on on findings from the the music industry's digitalization illustrate the changing institutional solution space, hence, contextualizing the papers conceptual approach.*

Results. *The music industry contextualization demonstrates how institutional elements influence resource integration and value co-creation. The institutional solution space concept helps understand the dynamic interplay between institutions, resource integration, and value creation. It emphasizes the need for firms to adapt to changing institutional elements to capitalize on emerging opportunities. The institutional solution space comprises regulative,*

² e-mail: peter.ekman@mdu.se

normative, and cultural-cognitive elements that enable or limit resource integration possibilities (Fehrer et al., 2020). Firms must recognize these elements' impact on value propositions and adapt to changing institutional arrangements. By focusing on resource integration and the institutional solution space, firms can better navigate market changes and enhance value creation.

We report on findings stating that, initially relying on vinyl records and CDs, the industry was unprepared for the shift to digital music facilitated by the internet. Early P2P file-sharing platforms disrupted traditional distribution models, challenging existing norms and regulations. However, market reactions, such as Apple's iTunes and the iPod, adapted to these changes by offering legal alternatives, reshaping the industry. The digitalization of the music industry provides a compelling example illustrating the evolving institutional solution space, without making broad empirical generalizations.

-From Vinyl Records to CDs:

For decades, the music industry thrived on vinyl records and CDs until the late 1990s when the emergence of the World Wide Web introduced new challenges. While the industry capitalized on the transition to CDs by re-issuing back-catalogs, it underestimated the impact of high-speed internet connections and online piracy. Initially dismissing online piracy as a minor inconvenience, industry leaders failed to anticipate users' increasing access to affordable computers, larger storage capacities, and faster internet speeds. Consequently, consumers found it easier to download music illegally than to purchase CDs.

-The Music Goes Online:

Early adopters utilized peer-to-peer (P2P) software to share music, exploiting a legal grey area. As technology advanced, new P2P platforms like Pirate Bay made accessing music easier and more widespread, challenging traditional norms of music ownership and consumption. With limited legal alternatives, users gravitated towards P2P platforms, reshaping perceptions of legality and ethicality.

-The Market Reacts:

Facing declining CD sales, the music industry had to adapt its value proposition. Apple's iTunes and iPod emerged as pioneers in offering legal digital alternatives, allowing users to purchase individual songs and compile personalized playlists. Rather than resisting technological change, Apple's approach embraced it, expanding opportunities for both users and companies. Today, consumers can access music through various channels, including digital platforms like iTunes and Spotify, as well as traditional formats like CDs and vinyl records.

Contrary to early predictions of a decentralized music distribution landscape, digital distribution is now dominated by a few key players such as Apple's iTunes, Tidal, and Spotify. While the range of solutions for accessing and enjoying music has expanded in recent years, the number of major players remains relatively concentrated compared to traditional record stores.

In summary, the illustration of the music industry's digitalization highlights the dynamic interplay between technological innovation, consumer behavior, and institutional change. By adapting to shifting market dynamics and embracing digital solutions, the industry has managed to evolve and thrive in the digital age, offering consumers a diverse range of options for accessing and enjoying music.

Research limitations. This conceptual paper prioritizes dynamic actor and resource constellations within service ecosystems over linear value chains. It aligns with the notion of markets as constituted by value constellations rather than linear value chains. However, while the paper aims for midrange theory development, it does not propose specific predictions due to its focus on presenting a comprehensive model. Future research could focus on developing propositions to predict the outcomes of resource integration in light of institutional elements and arrangements. Complementary empirical studies and conceptual refinements of the institutional solution space are encouraged to further elucidate the role of institutions in markets and marketing. While this paper presents a conceptual framework for understanding the institutional solution space, further empirical research is needed to validate and refine the concept. Future studies could develop propositions to predict value co-creation outcomes based on institutional arrangements. Additionally, exploring the role of institutions in specific industries and contexts could provide deeper insights into market dynamics and resource integration processes.

Managerial implications. Managers can leverage the institutional solution space concept to understand how institutional elements influence resource integration and value co-creation. This understanding can inform strategic decisions and help firms adapt to changing market conditions. The concept offers a holistic view of markets as starting point for analysis, and enables managers to identify opportunities for innovation and growth.

From a business perspective, the provided illustration shows how institutional elements interchangeably affect the actors actually being considered part of the context (and consequently the relevance and value of the resources they provide) and if and how their activities and resources affect the potential value that can be generated (in terms of the perceived "space" in which actors can integrate the resources). The solution space, as the perceived value creation potential, is both enabled and delimited over time by institutional elements—can be guided by regulation or deregulation, normative behavioral changes, or shifting cognitive-cultural frames of reference amongst social and business actors. By recognizing the business practice relevance of the "institutional solution space" as equally important to understanding

its role in the current market space, firms can be better prepared for changes beyond, for example, new technologies per se. As illustrated in the case study, the advent of new technologies is sometimes only an instigator of change, whereas the interplay of the changes in the institutional elements generate more transformative changes. The institutional elements change over time, affecting both resource integration activities, the prominence of involved actors, and how both social and business actors reposition their value propositions (i.e., leading to a realigned opportunity space). As previously outlined, different competing institutional elements are at play at different points in time, both enabling and limiting the potential value generated through actors' resource integration activities. The case also illustrates how different (established and non-established) actors can be both directly and indirectly engaged in and affected by institutional change, shaping their configuration in the service ecosystem and the nature of resource integration. It thus offers insights into the institutional solution space market's shaping and market innovating potential.

Fig. 1 contextualizes the institutional solution space as the area of resource integration possibilities (height) and engaged actors (width), also illustrating how the studied actors position their value proposition (opportunity space) at each point in time (dotted circles).

Fig. 1: Conceptualizing the institutional solution space (the case of the music industry).

Source: Authors own illustration.

The music industry transformation illustrates how the different institutional elements change over time based on the involved actors' (both business and social actors) reframing of current practices and norms. It also illustrates how the foci for a study—whether at the macro, meso, or micro level (i.e., a market, a group of companies, or an organization)—will need to adapt when it comes to framing the boundaries of the phenomena and the related actors. The institutional elements are often connected to the pre-designated actor roles (Thornton et al., 2012), as well as how “the rules of the game” (North, 1990) are understood. In Figure 1, the regulative elements that offer a certain institutional space are marked, but the normative or cultural-cognitive can differ. Therefore, there will often be a degree of friction between the different elements.

The case can be seen as a micro-level contextualization of the institutional solution space concept. The case illustrates how the dynamics of institutional elements affect the perceived boundaries (the resource integration potential) of available solutions in how the perceived nature of resources and the dynamic role and “functional identity of actors” (Rondell and Sorhammar, 2010) are integrated to generate a solution. The music listeners' newly acquired cognitive abilities of integrating digital technology iteratively created a cultural change that had a profound effect on the normative behavior of how music is marketed, distributed, and accessed. This, in turn, led to a change of legislation (i.e., the regulative institutional element) (Scott, 2014), thus enforcing and offering new opportunities for firms to redesign their value propositions. Rather than offering a pre-defined utilization of “plastic discs” as resource integration between CDs and a CD player, recorded music became a resource in itself, used as input for experiencing music in a number of contexts. Not only did the changes in culturally and cognitively derived behaviors led to changes in the normative and regulative dimensions, but the changes in the institutional elements also explained the changes in the very nature of the resources used for enjoying music (i.e., how new combinations and constellations of actors, resources, and activities were integrated to generate value).

Resources not considered relevant in the music context prior to the transition (telephone/modem lines, optical fiber internet connections) “became” relevant and vital (Fischer et al., 2010; Löbler, 2013; Peters et al., 2014) and the nature of “existing” resources was transformed in terms of their operand and operand natures. As stated above, rather than

focusing on the operand characteristics of music on a CD and firm output, music as a resource has become more operant in its nature, being used as input for value creation and transitioning the business from selling plastic discs to facilitating resource integration conditioned by the actors' perceived institutional solution space. This transitional change is not over; for instance, some artists and record companies provide user-toolkits in the form of snippets from a song to enable and even encourage fans to make personal versions of songs to be posted on social network websites. Facilitating user value co-creation (through resource integration) thereby contributes to a dynamic institutional solution space, in which the traditionally divided consumption and production contexts become more embedded. The opportunities offered by the changing and an expanding institutional solution space by using and integrating non-traditional resources and practices-competencies, capabilities and attributes-are potentially beneficial for all (social and economic) actors (as resource integrators) in markets (as networks and service ecosystems).

Originality of the paper. The institutional solution space concept also relates to market innovation, where alignment of institutional elements determines the success of new value propositions. Proactive engagement with institutional change can provide first-mover advantages and strengthen performance. Firms should develop institutional capabilities to leverage changing institutional arrangements for competitive advantage. The institutional solution space concept offers insights into how actors engage in resource integration and value co-creation within a service ecosystem. It highlights the role of institutional elements in shaping market dynamics and provides a framework for understanding market changes and business practices. Managers can use this concept to navigate evolving market conditions and optimize resource integration strategies.

The institutional solution space comprises regulative, normative, and cultural-cognitive elements, alongside actors' resource integration possibilities, shaping viable resource integration scenarios within a service ecosystem. This conceptualization underscores the dynamic nature of the institutional solution space, emphasizing its role in guiding value propositions within evolving institutional contexts.

Understanding the institutional solution space is crucial for grasping the dynamics of resource integration and value co-creation. It highlights the evolving nature of resources and actors' roles, transcending traditional notions of value creation. The dynamic interplay of institutional elements influences resource integration potential and value propositions, driving market evolution.

Market innovation hinges on the alignment of institutional elements. Actors can influence institutional dynamics through proactive engagement, paving the way for new forms of resource integration. However, regulatory alignment is essential for fully-fledged market innovations to materialize, creating legal opportunity spaces for value propositions to thrive.

Enterprises embracing the institutional solution space recognize the importance of offering new solutions aligned with evolving institutional arrangements. This goes beyond mere bundling of offerings, focusing on providing inputs for resource integration that leverage the institutional solution space. Proactive engagement with institutional change can confer first-mover advantages, emphasizing the need to develop institutional capabilities.

In conclusion, the institutional solution space concept offers conceptual originality through valuable novel insights for navigating market dynamics and capitalizing on emerging opportunities for value creation. By embracing this concept, businesses can strategically position themselves within evolving institutional landscapes, driving innovation and fostering competitive advantage.

Narrating the past. Exploring the antecedents of investments in heritage marketing tools by centenarian Italian companies

ANGELO RIVIEZZO¹ GIUSY MIGNONE² ANTONIO LUCADAMO³
MARIA ROSARIA NAPOLITANO⁴

Abstract

In recent years, corporate heritage has assumed considerable importance both in academic debate and managerial practice, in line with the growing attention given to the temporal dimension of organizations and questioning the traditional marketing approach to seeing the past as a “foreign country”. As the past has started to play a role in corporate-level marketing and communication purposes, corporate heritage marketing has emerged as a new academic field. Heritage marketing is based on the strategic use of the company’s historical and cultural heritage and the system of principles and beliefs of individuals and the organization. It offers the opportunity to build long-lasting relationships with all stakeholders. The main aim of this study is to investigate if and how Italian long-lived companies are oriented towards strategic exploitation of their cultural and historical heritage by investigating the actual use of the different tools potentially available to implement a heritage marketing strategy. Indeed, we investigate some potential antecedents of the adoption of the different tools among centenarian companies, namely the family nature of the business, its longevity, its size, and its social responsibility. To this aim, we collected information about 181 large companies entered in the National Register of Italian Historical Firms edited by Unioncamere. Data collection was conducted through desk research, while the Poisson regression model was used to test the hypotheses.

Key words: *heritage marketing; heritage marketing tools; corporate heritage; centenarian companies; Italy.*

Framing of the research. *Although all companies and all brands have a history, whether it be long or short, it is necessary to strategically enhance their journey to be able to boast a heritage (Riviezzo et al., 2021). In recent years, corporate heritage has assumed considerable importance both in academic debate and managerial practice (Balmer, 2011, 2013), in line with the growing attention given to the temporal dimension of organizations (Burghausen and Balmer, 2014). Within the corporate heritage canon, scholars have highlighted the centrality of the past, along with its significance for the present and the future of the company, questioning the traditional marketing approach to seeing the past as a “foreign country” (Balmer and Burghausen, 2019). As the past has started to play a role in corporate-level marketing and communication purposes and its strategic interpretation has offered more and more opportunities for strengthening relationships with corporate stakeholders (Napolitano et al., 2018), corporate heritage marketing has emerged as a new academic field, in search of a shared theoretical framework to be explored in terms of its managerial implications (Riviezzo et al., 2021).*

Adopting a strategic perspective in the process of heritage marketing is essential for a firm to rediscover, affirm and enhance the system of values, resources, skills and events that are the basis of its identity. Heritage marketing is intended as an integrated set of activities starting from the analysis of potentialities of stakeholder engagement and ending in the choice of tools that can communicate the historic and cultural patrimony (Napolitano et al., 2018; Riviezzo et al., 2021; Riviezzo et al., 2015c). More specifically, the past is interpreted from an evolutionary perspective, looking to the future and able to motivate and involve the internal and external stakeholders in the company project.

At the operational level, the company could theoretically use any tools and activities that function in storytelling. The company can use multiple narrative tools to leverage the heritage assets and, in this way, better convey the multidimensional nature of the corporate identity to different stakeholders (Napolitano et al., 2018; Burghausen and Balmer, 2014). Drawing on our previous works (Riviezzo et al., 2016; Napolitano et al., 2018; Garofano et al., 2020;

¹ University of Sannio

³ University of Sannio
e-mail: alucadam@unisannio.it

⁴ University Napoli Parthenope
e-mail: mariarosaria.napolitano@uniparthenope.it

Riviezzo et al., 2021), we propose a classification of potential operational tools, reducing the heritage marketing 'kit' to four essential categories:

- *Narrating through words, images and sounds: this includes all tools and activities where the story is expressed through words, images and sounds, regardless of the medium, e.g. from the most traditional 'paper-based' media - as the monography - to those using computerised technologies, such as websites and social networks.*
- *Narrating through products and brands: all activities carried out to position and communicate the brand and or the product through its heritage, particularly by leveraging evocative and emotional elements, such as historically symbolic brands, aspects of product design, and other elements that contribute to retro-branding and the revival or continuation of historical products.*
- *Narrating through places: this category refers to all the places and structures serving to preserve, enhance and transmit the company's historical memory, such as the original factories, headquarters and plant systems, and newly founded corporate museums and archives, as well as points of sale.*
- *Narrating through celebrations and relationships: this category includes events, celebrations of the crucial stages, milestones and personalities, and participation in associations and networking with historic companies at national and international levels.*

Many of the actions used to develop the cultural-historic patrimony of companies would fit into more than one of the above categories. For example, implementing a museum would involve written and, perhaps, audiovisual material, as well as brand communication (Riviezzo et al., 2022). Likewise, the organisation of celebratory events would draw on materials from company archives. Our categorisation serves as an example and is not exhaustive, since the range of potential tools is infinite and subject to continuous innovation and development.

Purpose of the paper. *The present contribution focuses on the strategic and operational methods through which the past can be transformed into a competitive asset. Indeed, management scholars have widely investigated the antecedents of business longevity and its relationship with performance (Napolitano et al., 2015; Riviezzo et al., 2015), while scant attention has been devoted to strategies and tools necessary to enhance the historical and cultural heritage accumulated over time. Furthermore, the studies carried out to date on the topic are mainly based on the analysis of individual company experiences, while there is a lack of more far-reaching analyses aimed at detecting the degree of use of heritage marketing tools and methods on a large scale. Thus, even "basic" hypotheses are far from having been empirically tested. For instance, is it or is it not conceivable that the use of heritage marketing tools is influenced by the company's nature of family business? Considering that the entwinement between the history of the family and the company provides "a particular basis for firms to uncover, activate and nurture heritage-based corporate identities and brands" (Blombäck and Brunninge, 2013, p. 328) we can expect such a result, but empirical evidence is missing to date. Similarly, the answer to other questions is not clear and unambiguous: is there a relationship between company longevity and the use of heritage marketing tools? The complex relationship between history and heritage has been the subject of several contributions (Arnold et al., 1998). On the one hand, scholars highlighted how the mere fact of having spanned the decades gives a company and its products a special appeal (Burghausen and Balmer, 2014). On the other hand, scholars have recognized how even the traces of a shorter journey can be exploited through narrative elements capable of generating emotional involvement in the stakeholders (Riviezzo et al., 2021). Also, scholars emphasized that corporate heritage does not only reflect firm-specific elements but also embraces place-specific resources that are embedded in company products and may be communicated through heritage marketing tools, such as, for instance, a corporate museum (Rudd and Davis, 1998). In this perspective, the establishment of a corporate museum is even intended as an expression of the social responsibility of the firm (Bonti, 2014). Thus, does it make sense to hypothesize that the use of heritage marketing tools is influenced by the company's social responsibility? And, finally, it is known that the process of heritage marketing is very complex, both at the strategic and operational levels, and requires heterogeneous and specialised skills that may not be fully available within the organization (Riviezzo et al., 2021). Thus, can the use of heritage marketing tools be influenced by the company's availability of resources, in term of size and turnover?*

We used the categorisation of tools described above as a main guidance in investigating the most common and diffused tools used by Italian long-lived companies, but we limited the analysis to only part of the above-mentioned tools. Then, we tested the following hypotheses:

- *H1: the family nature of the business enhances the use of heritage marketing tools.*
- *H2: the longevity of the business enhances the use of heritage marketing tools.*
- *H3: the size of the business enhances the use of heritage marketing tools.*
- *H4: the social responsibility of the business enhances the use of heritage marketing tools.*

Methodology. *In order to identify the antecedents that can determine the propensity of long-lived companies to invest in communication tools for heritage enhancement, comprehensive desk research was conducted. This research aimed to gather detailed and up-to-date information on the primary heritage marketing tools and activities previously identified.*

In particular, the study focused on companies listed in the National Register of Italian Historical Firms edited by Unioncamere. All companies of any legal form operating in any economic sector, active, with uninterrupted operation within the same product sector, for a period of no less than 100 years can be enrolled in this Register (established by Unioncamere in 2011). We decided to focus only on active companies, in the form of joint-stock companies. In fact, we believed that for this type of business, the heritage marketing action could be more structured and robust. Furthermore, it was considered easier for these companies to find the necessary information from secondary sources, with desk research. Finally, in a first phase of the research whose results are presented here, we decided to further narrow the

sample, by focusing only on joint-stock companies that were large in size (annual turnover exceeding 50 million euros and number of employees exceeding 249). Using this additional restriction, 181 companies were ultimately identified. In this group, 77 are family businesses.

The historical companies under investigation operate mainly in the industrial sector (72.30%), services (29.81%), and commerce (7.75%). A residual portion is engaged in other activities, including agriculture and craftsmanship, representing 2,76%. Looking at the foundation year, the vast majority (72.9%) can boast a history ranging from 100 to 150 years. 20.44% have a history spanning from 150 to 200 years, while 3.30% can claim a history of more than two centuries. Finally, considering the geographical distribution of the investigated companies, they are primarily concentrated in the North of Italy (81.76%), followed by the Center (12.70%), and the South with a residual presence (5.52%). Specifically, Lombardia stands out as the region with the highest concentration of centenarian companies, accounting for 32.04 % of the total sample under investigation. Piemonte (14.36%) and Emilia Romagna (12.70%) are the following regions.

For each of the 181 historic companies identified, we followed a standard research protocol which allowed to collect the information necessary to investigate the use of the various heritage marketing tools from secondary sources. As a first step, the institutional website of each company was consulted. Subsequently, any institutional pages created on the main social networks and other websites possibly dedicated by the company to specific heritage marketing activities were consulted (for example, the website of the company museum, the archive and so on). Further secondary sources were then consulted to delve deeper into specific activities and initiatives. For instance, press articles (for events, anniversaries, awards or other initiatives promoted by companies) were widely used. Finally, external and specialized sources were used to support or integrate the information found on the company's website and social networks. For instance, to verify the possible presence of a museum, information were also sought in the database created by Museimpresa, the Italian association of business archives and museums; to verify the possible creation of an archive, the list of company archives in the National Archives System (SAN) was also considered; to verify the existence of a monograph, the database of the Business Monographs Observatory (OMI) was regularly consulted; and so on.

In line with the established aims, information on factors that could affect the use of heritage marketing tools were also collected from secondary sources (including the database Orbis by Bureau van Dijk). We collected information related to company's shareholder structure (assessed as a business owned by a family or not), company's longevity (measured in years of uninterrupted activity), company's size (measured in turnover), and corporate social responsibility (assessed through the regular publication of a social report).

Results. The results reveal a heterogeneous use of the different heritage marketing tools investigated, with companies' clear predilection for some more common tools and little attention to other tools. As shown in Figure 1, the companies under scrutiny mainly use their institutional websites to tell their story (89.5%). The main other tools used are events organized to celebrate special anniversaries and other historical occasions (54.14%), traditional advertising campaigns in the mass media, in which there are clear references to the historical and cultural heritage of the company (55.2%), and the use of visual identity to highlight the historicity of the company (37%). Also significant is the number of companies that have decided to tell their story in a corporate monograph (46.40%). Equally important is the increasingly widespread diffusion of business archives 36.46%, followed by corporate museums 19.88%.

Fig. 1: Frequency distribution of investigated companies by heritage marketing tools

If we focus exclusively on family businesses, it emerges a greater propensity to convey their narrative through videos and advertising, referred to as heritage advertising (28.7%). These companies strategically use visual identity (21%) to accentuate the historical significance inherent in both the family and the company. They also increasingly engage in retrobranding activities (9.4%). Thus, some differences seem to emerge based on the family nature of the business. And, in turn, this makes more interesting the analysis of the possible antecedents of the use of heritage marketing tools.

To this aim, we consider the number of tools used by companies as the dependent variable in a Poisson regression, which is an appropriate statistical model for count data.

Tab. 1: Estimates for the Poisson regression model

Variable	Estimate	Std. Error	Z value	p-value
Family Business	0.2115	0.0795	2.660	0.0078 **
Longevity	0.0011	0.0004	2.387	0.0170 *
Size	0.0282	0.0105	2.677	0.0074 **
Social responsibility	0.2947	0.0770	3.827	0.0001 ***

*** < 0.001 ** < 0.01 * < 0.05

Table 1 shows the results of the analysis. All the estimates have a p-value lower than 0.05, indicating that the considered antecedents have a significant impact on the use of heritage marketing tools. To evaluate their influence, we highlight that in the Poisson model the relationships are not linear, but multiplicative. This means that, for example, focusing on first explicative variable, if the shareholder structure is a family business, the expected number of heritage marketing tools is multiplied for 1.236 ($\exp(0.2115)$) respect to expected value for the not family business. Thus, the first hypothesis is supported. The same considerations can be done for the second hypothesis. When companies have a higher longevity, the number of tools increases (for each year a multiplicative effect of 1.0011 ($\exp(0.0011)$)). The multiplicative impact of the size (turnover) is about 1.0286. This supports H3. Also, with reference to the last estimate there is a positive multiplicative effect ($\exp(0.2947) = 1.3427$). This means that the presence of a social report enhances the use of heritage marketing tools, and this confirms H4.

Research limitations. The present work is not without its limitations. The analysis was conducted on a relatively large sample (181 observations), but one that takes into consideration only large companies. However, this is only the first step in a research path that aims to extend the analysis to small and medium-sized companies registered in the National Register of Historical Italian Historical Firms edited by Unioncamere.

Secondly, our analysis was underpinned by a diverse array of secondary sources, encompassing corporate websites, archives of various organizations, press reviews, and other pertinent outlets. Consequently, it's imperative to acknowledge the potential for missing data throughout this investigative endeavor.

Finally, it is important to note that the analysis conducted focused only on companies registered in the Register of Historical Firms, whose registration process takes place voluntarily, although subject to specific requirements. This implies that the study may not have considered other large Italian long-lived companies.

Managerial implications. Our results highlight how long-lived businesses, traditionally recognized as custodians of a unique historical and cultural heritage capable of guaranteeing a competitive advantage through a distinctive positioning, very often miss the innumerable opportunities linked to the enhancement of their deepest roots. In fact, companies approach the individual heritage marketing tools in an experimental way, without a transversal vision that allows them to exploit the different dimensions of the company's historical identity. In fact, as our data clearly pointed out, none of the companies investigated uses all the tools considered and there are very few (27%) that use at least one tool in the different categories mentioned above.

In a nutshell, therefore, our research pointed out that long-lived companies, despite their growing attention to the narration of corporate heritage, have not yet fully developed an integrated vision, placing heritage at the center of a communication strategy conveyed through multiple tools and channels. It is worth noting that the family nature of the business emerged as one of the variables explaining the increased propensity to invest in heritage marketing tools. In the specific case of family businesses, narrating both company and family history as strictly related to corporate heritage can be a means of managing the duality of continuity and change (Blombäck and Brunninge, 2013), highlighting how the family business has renewed over time without losing a connection with the past generations. It is also very interesting the relationship between the social responsibility of the company and the use of heritage marketing tools. Through the narration of company's heritage, corporate culture becomes collective culture, thus contributing to the development and transmission of local heritage, with clear benefits for the place and the community. The results show also that larger and more structured companies are the most oriented towards the exploitation of the company's heritage in terms of market relations, using more tools at the same time. This result is in line with the marketing literature that shows that smaller companies, in general, tend to implement marketing activities in a more informal and unstructured manner (Blankson et al., 2006; Riviezzo et al., 2013). Finally, although the literature clearly shows that the concept of "history" and the concept of "heritage" are separate (Arnold et al., 1998), with the consequence that a heritage marketing strategy can be pursued regardless of the age of the company, the results of this study lead to the assertion that the tendency to invest in heritage activities is greater in companies that are older. It is therefore conceivable that the focus on heritage marketing increases with the longevity of the company, especially with the attainment of certain milestones that often coincide with the first convinced investments in this direction (e.g. the publication of a monograph or the opening of a museum to celebrate the first 100 years).

Originality of the paper. This study is the first example of large-scale investigation aimed at observing the use of different tools of heritage marketing and the first attempt to identify possible antecedents at organizational level that may affect the use of such strategy. However, it is just the first step of a research process, which is aimed to extend the analysis

to other centenarian companies enrolled in the National Register of Italian Historical Firms edited by Unioncamere, also including medium and small-sized ones, and to investigate if the identified antecedents may affect differently the diverse categories of heritage marketing tools.

Examining Healthy Food Consumption Among People Over 60 years

VINCENZO GISSI¹ ELISABETTA SAVELLI²

Abstract

This research analyzes the perceptions, determinants and behavioral intentions regarding the consumption of healthy food among individuals aged over 60 years. Data collected through an online questionnaire distributed among the Italian population revealed a strong interest in healthy eating motivated by health benefits and personal well-being. However, some concerns about healthy food still represent barriers, which limit their current consumption. The study provides valuable insights for the development of interventions and communication strategies, acting at different levels (i.e., health-care professionals and food companies) aimed at promoting healthy ageing of population and the overall social well-being.

Keywords: *healthy food; elderly people; social well-being; food consumption.*

Framing of the research. *Over the time, food consumption has undergone significant changes under the influence of several factors such as cultural shifts, economic developments, and technological advancements. One of the biggest changes has been the gradual recognition of health as a fundamental motivator of food choices (Cena & Calder, 2020). Indeed, as individuals have become more informed about the connection between dietary habits and overall well-being, there has been a significant increase in prioritizing health in food consumption (Saba & Vassallo, 2012). The Global Health and Wellness Survey carried out by AC Nielsen (2021) on consumer sentiment across 17 diverse global markets revealed that 39% of global population is overweight, 2.8M die each year as a result of being overweight and 21% of global consumers have shifted health priorities because they have gained unwanted weight.*

The reasons why health has become an essential priority range from the desire to live longer and to look and feel better, to the sway of social media and the burden of rising costs of healthcare (AC Nielsen, 2021). Moreover, the continuous accumulation of food scandals over the past decades, like the BSE occurring in the mid-to-late 1990s in the UK, the German dioxin scandal in 2011, and the presence of salmonella in certain infant milk-products in 2018, have further contributed to the increasing interest in health-related issues. That's why, Governments and regulatory bodies "have gradually improved their common responsibility and interest in preventing public health problems related to the food chain" (Thomopoulos et al., 2022), by promoting initiatives and practical recommendations in which healthy diet is essential for good health and nutrition (Lambrinou et al., 2013; Patience, 2016). As an example, North America updated FDA guidelines to set voluntary sodium limits for 160+ categories of processed foods with the goal of helping consumers cut their salt intake by 12%, while France and Germany are introducing new labelling initiatives, to provide more clarity on the health effects of their contents, within the overall European "ecolabel" strategy timed for 2024.

People often classify food as either healthy or unhealthy based on factors like perceived fat and sugar content, and the presence of artificial ingredients, which results in a growing avoidance of products such as red meat, sweets and animal fats, and an increasing demand for fruits, vegetables, eggs and fish, or less processed foods like whole grains (Skerrett & Willett, 2010). Frequently, also organic and functional foods have been perceived to be healthier and more natural than conventional ones (Alkhatib et al., 2017). This outlines two main suggestions. First, the concept of healthy food cannot be univocally defined, as it varies according to the individual perception and the focus of attention. Past literature clearly reveals this diversity, as some scholars have related healthy food to a balanced diet full of proteins, carbohydrates, and fats, moderation and regularity in food consumption and meals control, increasing fruits and vegetables eating and reduction of high-fat food intakes (Paquette, 2005; Krahn et al., 2011; Bisogni et al., 2012), while others associated healthy food to the avoidance of specific cooking habits, such as fried meals (Povey et al., 1998). The second suggestion emerging from the current research on healthy food consumption deals with the relationship between healthy and sustainability. As noted by Machin and Chen (2023, p. 9), foods that are "positioned as having some kind of health benefit often also combine ethical consumption ideas, such as 'natural,' 'organic,' 'sustainable,' 'local,' or 'recyclable'". That is, consumers tend to associate sustainability with higher perceived health (Verain, et al., 2016) since they "often encounter health and sustainability together in products" (Cho & Baskin, 2018) as it emerged in several studies on vegetarian meals (Kareklas et al., 2014), organic (Petrescu & Petrescu-Mag, 2015) and regional food, i.e.

¹ University of Pesaro e Urbino
e-mail: v.gissi@campus.uniurb.it

² University of Pesaro e Urbino
e-mail: elisabetta.savelli@uniurb.it

food growing in the surrounding region that are believed to be healthier, fresher and more sustainable than conventional one (Savelli et al., 2022). Therefore, the consumption of healthy food is a central topic in modern society, as it improves both sustainable development and long-term well-being of the population.

Consuming healthy food is particularly important in the early child period of life to support optimal growth and development (Welker et al., 2018). However, it becomes increasingly important also in the later stages of human life cycle, when population ages, since elderly people are particularly vulnerable to health issues and dietary-related diseases (Joyce et al., 2005). Previous research has highlighted the need for continuous education on health risk factors and the importance of seniors taking responsibility for their own health (Cho & Kim, 2022; Ishida et al., 2020). Therefore, dietary education, meal service, and various dietary interventions improving fruit and vegetable intake, dietary variety, and physical condition in older adults, have been recognized to be critical to promote healthy eating and the overall quality of life (Zhou et al., 2018).

Despite this evidence, there is a lack of studies that delve into emotional, behavioral, and motivational factors orienting dieting habits of elderly people towards food selection (Carfora et al., 2022). Moreover, they often focused on specific product categories, such as fruit and vegetables (e.g. Appleton et al. 2017), protein (Linschooten et al. 2021), and beans (Doma et al. 2019), thus reducing the results' generalizability, and usually considered the elderly population as a whole, without analyzing specific sub-groups with different food choices and habits (Caso and Vecchio 2022).

In addition, it must be said that past research often provided contradictory findings, especially when comparing elderly food behaviours with younger ones. For instance, some scholars have shown a bigger consumption of sugary and fatty foods in younger people than in elderly ones (Bleich et al., 2018; Nour et al., 2017), while others demonstrated that younger generations are highly interested in health benefits and natural contents of foods, despite their attention to the convenience of preparation and availability of food products, in terms of price and distribution (Mitic & Vehapi, 2021). What seems to be significant in explaining the differences between young and elderly people is the underlying motivations driving healthy food consumption, as adults and elderly are mainly driven by a deep sense of consciousness about health-related consequences of food choices, while proper nutrition and health education is naturally engaged in young people's mind, since they grew up in a social environment driven by a strong sense of responsibility (Savelli et al., 2023).

All this suggests the opportunity to improve the current state of knowledge on healthy food consumption among the elderly generation, by investigating their attitudes, consumption patterns, and perceived benefits and barriers associated to healthy food choices, in order to provide valuable insights for developing interventions and strategies enhancing their overall health and well-being.

Purpose of the paper. This study aims to fill the existing gap by examining the perceptions, determinants, and behavioral intentions regarding healthy food choices of elderly people, ultimately contributing to the development of effective interventions and policies. More specifically, the study addresses the following research questions:

RQ1: How do elderly people perceive healthy food? Do they know the properties of healthy food and what benefits and barriers associate to it? Are they satisfied with their past consumption experience and intend to consume healthy food in the future?

RQ2: Are there any differences among consumers aged over 60 years towards healthy food based on their individual characteristics (i.e. gender, age, body weight condition)?

Methodology. Data for this study have been collected through an online self-administered questionnaire, distributed over a six-month period (September 2023-March 2024).

The survey was conducted online using the computer-assisted web interview (CAWI) method given its efficiency, cost-effectiveness, respondents' anonymity, broad geographic reach, and comprehensive data collection (Kraut et al., 2004; Sowa et al., 2015; Thompson et al., 2003). Specifically, the online questionnaire was shared on social media platforms such as Facebook, Instagram, LinkedIn, WhatsApp, and Telegram.

The sampling procedure was based on a convenient non-random sampling method, considering the Italian population aged over 60 years. Data from ISTAT (2023) have been considered for calculating the Italian population by age, whilst the appropriateness of the sample size was checked by applying the Brasini et al.'s (2002) formula:

$$n = [Z^2 a/2 \times N] / [4(N - 1)\theta^2 + Z^2 a/2] = [1.96^2 \times 17.706.146] / [4(17.706.146 - 1) \times 0.05^2 + 1.96^2] = 384$$

where n =sample size; $Z^2 a/2$ =confidence level=1.96 (calculated using the tables of the standard normal distribution); N =Italian population aged 60-90 years at 01/01/2024=17.706.146 (<https://demo.istat.it/app/?i=POS&l=it>); θ =margin of error allowed (set at 5%).

The data collection process resulted in 334 valid responses at 01/03/2024. The number is still under the threshold suggested by the above formula. However, it is very close to it and therefore acceptable, also considering the ongoing process of the research.

As for the questionnaire, it was divided in four parts. The initial part focused on understanding individuals' knowledge of healthy food and the main sources informing them. The second part focused on motivators, benefits and barriers related to healthy food consumption. The third part examined respondents' satisfaction about healthy food as well as their future behavioral intentions. Lastly, demographic data including age, gender, level of education, and family status were collected. Information on body weight and height have been included in this section to assess the Body Mass Index (BMI), as it is significantly correlated with dietary patterns (Bion et al., 2008).

All the questionnaire items have been carefully chosen and adapted from previous research to assure their content validity. In particular, items for knowledge, satisfaction and behavioural intention have been taken from Lee et al.'s (2018) scales that had already been validated in previous research. Motivations and information sources influencing

healthy food consumption have been defined in line with the '2017 Food and health Survey' provided by the International Food Information Council (IFIC) Foundation, which has been taken in several other studies. Finally, both benefits and barriers associated with healthy food consumption were assessed by using the multi-items-lists of Pawlack and Colby (2009). The responses were measured on a 7-point Likert scale, with 1 representing exceptional disagreement (or unlikely) and 7 representing exceptional agreement (or likely).

Before starting the data collection, the questionnaire was pre-tested by involving a group of academic researchers having a deep knowledge and expertise on both the research subject of the survey and the methodology (i.e. how to collect the most accurate data for our research questions). This allowed us to check the content and form of the questionnaire, improving its comprehension, flow and logic, and length acceptability.

The collected data have been analysed with STATA (StataCorp LLC, 4905 Lakeway Drive College Station, Texas 77845 USA), version 17.0. It is a general-purpose statistical software package for data manipulation, visualization, statistics, and automated reporting, widely used in many research fields, including biomedicine, economics, epidemiology, and sociology. In this step of the research, only descriptive statistics (based on mean values, standard deviations and frequencies) were used to gain a preliminary and exploratory overview of the research topic.

After describing the general characteristics of the sample, we investigated the main results concerning healthy food knowledge, satisfaction, and behavioural intention. Moreover, the main motivations, benefits and barriers have been described to identify potential healthy food patterns characterizing this generation (RQ1). Next, to address the second research question of this study (RQ2), we divided the sample into sub-groups based on gender, age and body weight (i.e. BMI), in order to detect the existence of any differences between them.

Results. Starting from the demographic data, 166 men and 168 women participated in this study, ranging from 60 to 91 years old, with an average age of 68 years. About one third of the participants (96) come from northern Italy, 196 live in the central regions and 42 in the southern part of the country. Most respondents have a high school (163) or a middle school diploma (82), while only 55 participants have a bachelor's or master's degree; the remaining subjects attended just the elementary school (34). Regarding the body mass index (BMI), calculated as $\text{mass}(\text{kg})/\text{height}(\text{m})^2$, the data ranged from a minimum of 17 to a maximum of 41, with an average value of 24,5 (s.d.: 3.3), suggesting an overall tendency of the elderly population to be normo-weight³.

As concerning the individual knowledge of healthy food, more than 60% of the sample responded with a rating of 5 or higher when asked how much they think to know about it. This is a positive result, which foreshadows a favorable attitude by the elderly towards healthy food consumption. Indeed, prior research has empirically demonstrated that knowledge about good nutrition can directly affect personal eating habits, encouraging the adoption of a reduced healthier diet (Trepka et al., 2006). The main sources used to acquire information by the elderly appear quite heterogeneous. They seem to be particularly receptive to dietary advice from health professionals, whereas other sources of information do not always succeed in convincing them. More in detail, 77.5% of the sample responded with a value of 5 or higher to the question on how much they trust the advice of dietitians, while 31.7% declared to trust the advice of bloggers, 29.6% the advice of friends or family, and 38,3% declared to have confidence in newspaper articles. This confirms prior research highlighting the highest confidence of elderly generations in the opinion and recommendations from specialists for matters relating to food (Borges-Tiago et al., 2016).

The second section of the questionnaire investigated the main motivations, benefits and barriers associated to healthy food consumption. Based on the answers, the attention towards these foods mainly comes from the individuals' concern about their health condition (mean: 6.1; sd: 1.1) and potential diseases, followed by health care professionals (mean: 5.3; sd: 1.4). Hence, the motivation for healthy food consumption relies more on the occurrence of a contingent condition rather than a natural preference and attitude towards it. This confirms prior research findings suggesting that a poor health status is a major factor behind elderly's food choice, as health problems increase people's concern for long-term wellbeing (de Morais et al., 2010). Responding to the perceived benefits, the main aspects coming out from the survey were the sensation of feeling good (mean: 5.9; sd: 1.1), taking care of one's body (mean: 6.0; sd: 1.1), and weight loss (mean: 5.4; sd: 1.4). Specifically, 68.8% of the respondents rated the first factor with a value of 6 or 7; 70.6% rated 6 or 7 the second factor, and 51.8% rated 6 or 7 the third factor. As for the barriers, the price does not seem to be a relevant factor: only 56% of the respondents assigned a value greater than 4 to the question "Healthy foods are too expensive". Similarly, poor appreciation of healthy food by other family members who live with the elderly do not seem to be significant barriers. On the contrary, many participants declare not to like the taste of healthy food: 75% responded with a value above 4 to the question "Healthy foods do not taste good", suggesting that, when barriers to healthy food consumption occur, they are mainly related to people's own hesitation. This result corroborates prior studies (Bloom et al., 2017; Tani et al., 2015) revealing the importance of taste and enjoyment in elderly food choices, which often results in unhealthy food choices with negative health consequences.

Finally, the questionnaire attempted to investigate the degree of satisfaction and behavioral intention of elderly people in consuming healthy food. The results show that the majority of respondents are satisfied with the consumption of healthy food they usually eat (mean: 5.08; sd: 1.58). Moreover, respondents have shown a positive behavioral intention towards healthy food, since they generally intend to keep eating such foods (mean: 5.41; sd: 1.55), to recommend them to personal

³ The World Health Organization classifies the BMI status for adults in agreement with the International Obesity Task Force (IOTF) criteria: BMI<18.49: underweight; 18.5<BMI>24.99: normal range; 25<BMI>29.99: pre-obese; BMI>30: obesity. https://ec.europa.eu/health/ph_determinants/life_style/nutrition/documents/iotf_en.pdf

friends (mean: 5.13; sd: 1.63), and to increase the future intake of healthy food in their dietary habits (mean: 5.43; sd: 1.57). This confirms that the more elderly people are acknowledged about healthy food properties, perceive their benefits and are well satisfied, the more they are prone to consume healthy food and to adopt a healthy eating behaviour (Caso & Vecchio, 2022).

To provide more knowledge about the dietary patterns of elderly people, this study explored whether individual characteristics of the respondents have significant impact on the variables previously analyzed, i.e. knowledge of healthy food, motives, benefits and barriers, satisfaction, and behavioral intention.

The comparison has been made using the percentage of very high responses (value of 6 or 7) compared to the total responses.

Firstly, the analysis compared men and women. Regarding the individual knowledge of healthy food, only 33% of men responded with a very high value, compared to 42% of women. The sources they use are quite different: women tend to prefer the advice of health care professionals (53%; men: 49%) and dieticians (63%; men: 54%), while men believe more in the advice of bloggers (17%; women: 14%) and newspaper articles (15%; women: 14%). There are no major differences regarding the main motivators and barriers for adopting healthy food, while regarding the benefits it provides, women compared to men responded that healthy food helps them feel better (77%; men: 61%) and taking care of their own body (74%; men: 67%). Furthermore, satisfaction with the consumption of this food is higher in women than men (55%; men: 41%), as also results in their behavioral intentions: women generally intend to keep eating healthy food more than men (60%; men: 50%), to recommend them more (59%; men: 40%), and to increase the future intake of healthy food more (64%; men: 47%). All this confirms prior research on the elderly generation revealing that women tend to be much more involved than men in healthy food consumption as they have better nutritional and health knowledge than men (Ueland, 2009).

Secondly, we divided the ages into quartiles and compared the first quartile, made up of participants between 60 and 62 years old (under62), and the fourth quartile, made up of participants between 71 and 91 years old (over71). There is not a big difference in the answers on individual knowledge of healthy food (41% under62 - 38% over71). The greatest difference between the sources used for information concerns the use of bloggers as informant sources (28% over 62 - 5% over 71). No relevant difference between reasons, benefits and barriers towards the consumption of healthy food have emerged. Satisfaction is higher for subjects over71 (56%; under62: 42%) as well as behavioral intention is: they generally intend to keep eating healthy food more than under62 (61% - 49%), to recommend them more (56% - 42%), and to increase the future intake of healthy food more (62% - 52%). Probably, the individual intention increases with age, since elderly people become more aware and worried about their personal health and long-term wellbeing.

Finally, we divided subjects into quartiles based on BMI similarly to what was done for age: the first quartile is named as under22.5 and the last quartile is named as over26.3. Regarding the individual knowledge of healthy food, the high answers are equivalent, however the sources used by the respondents are different: under22.5 trust more dieticians (62% - 50%) and bloggers (20% - 5%) while the group over26.3 trust friends more (21% - 13%). Regarding the reasons that push these subjects to consume healthy food, subjects over26.3 are more worried about their health and potential diseases than subjects under22.5 (76% - 68%), and they listen more to health care professionals than the others (58% - 45%). Besides, this group (over26.3) is more sensitive to benefits such as feeling better (70% - 65%) and taking care of their body (74% - 62%). However, the over26.3 group also perceives healthy food as too expensive (21% - 18%) and not tasty (20% - 18%). In conclusion, satisfaction and general behavioural intention are similar in these two groups. This leaves open the debate on the relationship between BMI and healthy food consumption, suggesting the opportunity to further investigate the "directionality of this relationship, i.e. whether these shopping preferences habits cause overweight and obesity or whether overweight causes people to shop in this manner" (Worsley et al. 2011, p. 877).

Research limitations. Based on the findings of this study, it is evident that elderly people exhibit a strong interest in consuming healthy foods, driven by various factors including their perception of health and personal well-being benefits. However, this research is not sufficient to explain all the reasons that push this age group to eat healthy food. Firstly, the main limitation arises from the adopted sampling procedure. Employing a convenient non-random sampling technique and disseminating the survey through a weblink offered advantages such as quickness, low cost, and anonymity of respondents. However, this approach does not allow for complete generalizability of the study results. Additionally, the analysis was conducted only among Italian people, therefore, specific socio-cultural factors may have influenced the obtained results. Concerning the findings, further analyses are needed, based on multivariate techniques (such as regression and clustering) and validity tests. Finally, another limitation arises from the quantitative nature of the research. While quantitative methods enable the reaching of a large sample of respondents and allow for the generalizability of results, they often lack depth. Therefore, for future research, it would be beneficial to explore qualitative approaches that incorporate both generalizable and in-depth results.

Managerial implications. Overall, the findings of this study provide valuable insights for managers seeking to promote healthy eating among individuals over 60, emphasizing the importance of tailored communication, leveraging trusted sources, addressing taste perceptions, and highlighting the benefits of healthy eating to encourage long-term adherence.

Specifically, despite the good level of self-perceived knowledge, communication strategies and education programs could be improved to enhance the overall acceptance of healthy food by elderly people and their positive attitude towards its consumption. In particular, this study provides suggestions in terms of both communication channels and information content. As for the channels, elderly people tend to trust in health care professionals, such as dieticians. This probably relates to the fact that they usually associate healthy food consumption with health and disease prevention. Therefore,

health professionals should improve both informal communication, by dedicating more time to their patients in face-to-face meetings, and public campaigns aimed at reinforcing the importance of a healthy diet, its benefits for long-term well-being and the need to include healthy food in daily habits. In this respect, for example, organizing local “special days” dedicated to health, where participants can take advantage of some medical services (e.g. free blood pressure measurement), could play as an opportunity to offer information sessions enriching the elderly interest in healthy eating and their desire to change unhealthy habits. This could be particularly effective with elderly women, that seem to be more sensitive to professional information, as well as with those elderly that are over-weight, as it emerged from our data. Traditional channels, like newspapers, and digital ones, like bloggers, could also be useful to inform people over 60 years about healthy food benefits, especially in the case of men and the younger age groups of the elderly. Anyway, this study highlights the importance of understanding the credibility of information sources for promoting healthy eating among adults and older individuals.

By considering the information content, two results are particularly worthy of evidence. Firstly, the concern about taste is an important point to analyze as it emerged among the main barriers to healthy food consumption, especially in the case of over-weight people. Efforts should be made to address taste perceptions and make healthy food more palatable to this population, potentially through innovative cooking techniques. In this respect, also food companies could contribute by offering flavor enhancements and, especially, local ingredients addition. Indeed, as elderly people are particularly attached to their history and eating traditions, the use of some local ingredients, such as ricotta cheese, honey, and San Marzano tomatoes, could taste better on their tongue, thus remaining for a longer time on their mind. Secondly, the comprehension of the main motivators and benefits underlying healthy food consumption provides further suggestions on how to orient the communication efforts. Overall, elderly people recognize health-related advantages in healthy food consumption, such as prevention diseases and weight loss. Therefore, communication campaigns should focus mainly on these benefits, by communicating, for example, that healthy food could act as a substitute of the medical treatments, providing easier solutions to common diseases such as obesity, diabetes, and high cholesterol. However, since women appeared to be more interested than men in their physical appearance, communication should provide targeted messages to catch their attention based on different information and tone contexts which rely mainly on these potential advantages related to healthy eating. Moreover, it could be useful to reinforce information on healthy food within the retail context, since women tend to attend food stores more frequently than men (Worsley et al., 2011).

Originality of the paper. In conclusion, this study enriches prior knowledge on elderly people and healthy food consumption in different ways. First, it provides valuable insights into the comprehension of individual attitudes and behavioral intentions of elderly people towards healthy food consumption, which has been less investigated by previous literature. Notably, it moves the attention from situational (e.g. physical and cognitive status, living condition, social support, etc.) and socio-cultural variables (e.g., income, education, geographical area, etc.) to cognitive (i.e. ‘perceived benefits and barriers’, ‘knowledge about healthy food’) and emotional factors (i.e. ‘satisfaction’) explaining the elderly intention to consume healthy food. These variables have been scarcely analyzed, while being extremely important to understand the elderly consumers’ information processing, behaviours and purchasing intentions (Bagozzi et al. 1999; Bully et al. 2015). Second, the present study attempts to analyse the differences among sub-groups of elderly people. Extant literature demonstrated that this generation is quite heterogeneous, with significant differences in healthy food patterns according to their health status and socio-demographic conditions (Guido et al. 2022). Therefore, it is interesting to investigate such diversity, to provide more specific suggestions to healthcare professionals and policymakers aimed at developing targeted interventions promoting healthier eating habits and the overall improvement of health outcomes of elderly population.

The new dimension of brand in ‘metaverse’: a structured literature review

DOMENICO MORRONE¹ ANNUNZIATA TARULLI² KAROLINA SALLAKU³

Abstract

This study has the aim to verify the actual evolution of brand in the context of metaverse. The latter represents a new dimension where companies and organizations need to redefine their customers’ relationships, inside a total virtual experience. Metaverse could be the latest challenge, connected to other technological developments, to improve the brand policy. The research, being a structured literature review, takes into account more than 50 papers published over the 2006-2022 timeframe. Five main clusters were identified with theoretical and managerial implications. In particular, the results show as the metaverse could play a strategic role in improving the consumer experience through the virtual world.

Key words: brand; metaverse; virtual worlds; metaverse marketing; structured literature review.

Framing of the research. *The technological innovation always played an important role in the evolution of marketing. Actually it is possible to observe the introduction of new instruments, as the metaverse, that could have a concrete impact on the consumer experience. The latter marks the most recent and definitive transition from the physical world to the virtual world, after previous experimentations that were not so totally immersive as the last one. Metaverse represents a complete experience in a not traditional environment but, only in recent years, companies and organizations are concretely testing this improved context. One of the reason of what above mentioned is due to the constant improvement of connections and smartphones, since operations in the metaverse require a fast connection and devices able to manage huge quantities of megabytes. This evolution, being at the beginning, needs to be deeply studied and explored by scholars and practitioners, to highlight the real potential. The leap into the metaverse can concern various marketing strategies/actions, including those linked to the brand. The framework of this research is structured on the papers that will be analyzed below, whose attention is focused on the impact of metaverse on branding.*

Purpose of the paper. *The aim of this structured abstract is threefold. First, this study seeks to extend the research in brand management when ‘metaverse marketing’ is concerned. Second, it provides the state of the key research blocks involving the defined research areas to make a complete picture of the phenomenon under investigation. Finally, a research framework related to the main drivers of the metaverse exploration, as well as future directions for both scholars and practitioners, will be presented. In this way, relevant insights on how metaverse can be employed in brand management practices and consumer behaviour strategies will be provided. Therefore, the paper aims to address to the following research questions:*

RQ1: What is the state of the art in the field of brand and metaverse?

RQ2: What are the key research blocks related to brand strategies in the metaverse?

RQ3: What are the future research directions when brand management is applied to the metaverse?

Methodology. *In order to answer to the defined research questions, a structured literature review (SLR) was performed in the field of brand management and metaverse. This methodology allows to systematise and categorise the state of the art on a specific topic (Vrontis et al., 2020; Vrontis and Christofi, 2021). To better address the research questions the search keywords were identified by analysing the metaverse concept across several studies and sectors. Following Hollensen et al. (2022), the metaverse is defined as an aggregation of virtual worlds. Therefore, the term ‘metaverse’ was integrated by a more extensive interpretation such as ‘virtual worlds’, for this reason the main search keywords resulted in ‘brand’, ‘virtual worlds’, and ‘metaverse’. For data collection, the Scopus database was employed as it is considered the most used instrument by scholars. The search process followed three steps: identification, screening, and inclusion. A sample of 142 published articles was retrieved from the Scopus database from 2002-2022*

by setting the following research query: TITLE-ABS-KEY (brand) AND TITLE-ABS-KEY (metaverse) OR TITLE-ABS-KEY (“virtual world”). A set of exclusion criteria was defined in order to effectively address the study aims and research questions. Consequently, books, book chapters, and conference proceedings were excluded, and papers not coherent with research topics, publication type and language (Kauppi et al., 2018) with a further abstract reading. Thus a final sample of 52 published articles was defined for the final analysis, as described in the Figure 1.

Figure 1 – Search strategy

The analysis was developed in three steps to answer our research questions and provide an in-depth understanding of the phenomenon under study. First, a descriptive analysis was used to present the sample’s publication and citation structure, as well as the most influential contributions. Then, a cluster analysis and a content analysis were performed based on a bibliographic coupling method, highlighting exciting research areas. Following others’ contributions (Del Vecchio et al., 2021; Khan et al., 2020; Van Eck and Waltman, 2017), VOSviewer software was adopted for the graphical mapping of the bibliometric data in terms of collaboration and citation connections.

Results.

Descriptive analysis - The goal behind the descriptive analysis was mainly to rank the sample by the number of publications per year, geographical analysis of authorship, number of citations, common keywords, and the identification of the most influential authors. Regarding the distribution over the years, Figure 1 displays the number of published articles over the 2006-2022 timeframe. In particular, the graph shows that the first article was published in 2006 and was the sole publication for that year. The same scenario is evident in the following period, followed by the absence of contributions in 2008. Moving from 2009 to 2011, an increased number of publications was observed, with a peak in 2011 with eleven articles. However, in 2012, there was a drastic drop in the number of publications, followed by a sinusoidal trend in which, after a modest number of published articles, a considerable peak was observed in 2022. These findings demonstrate how the literature on metaverse and virtual worlds began to flourish recently, thus explaining its fragmentation over time. Due to its topicality, the increased number of contributions in recent years is linked to the greater awareness and interest in the subject by academics and practitioners, together with its potential applications in various fields.

Figure 1. Publications Trend

The distribution of articles per country and the number of citations per country were considered to analyse the articles' geographical area (Tab. 1). The count considered the involvement of a country (per university/research institution) in the authorship of the articles. For example, if an article was developed by the cooperation of several countries, the software will assign each country one point. In this way, it was possible to understand which countries have ever shown interest in studying the understudy topic. Furthermore, to get a complete picture, we cross-referenced data on authorship and the number of citations by countries and compared their rankings. Data revealed that the United States, the United Kingdom and Australia ranked first, second and fifth in both the number of contributions and the number of citations. In detail, the United States count 18 published articles and 509 citations, followed by the United Kingdom with 10 published articles and 130 citations, while Australia closes the top five chart with 3 published articles and 38 citations. Although several countries have expressed their interest in the subject, it seems that the United States represents the most influential country. This result could be related to the American nationality of virtual industry giants, being Silicon Valley the place where the metaverse was born and developed. However, the more this environment develops, the more it is likely to spread to other states. Therefore, possible changes of scenario must be taken into account for the future.

Table 1. Top five countries per publications and citations

Ranking		N. of documents		N. of citations
1	United States	18	United States	509
2	United Kingdom	10	United Kingdom	130
3	China	4	France	85
4	Germany	3	Denmark	57
5	Australia	3	Australia	38

Table 2 highlights the top three academic journals in which the papers included in the sample were published. Studying where articles are published represents an important indicator, especially for researchers and authors (Del Vecchio et al., 2021; Dumay and Cai, 2014). So far, the top-ranked journals are Linguistic and Philosophical Investigations (six publications), Journal of Brand Management (five papers), and Journal of Marketing Management (two articles). The ranking shows us a high level of heterogeneity, as topics range from brand to marketing management, with an investigative perspective.

Table 2. Top three journals sources

Scientific journal	N. of paper
Linguistic and Philosophical Investigations	6
Journal of Brand Management	5
Journal of Marketing Management	2

As for the most cited papers, Table 3 confirms the geographical interest around this topic from the United States and the United Kingdom mentioned before. Following previous SLRs (e.g., Massaro et al., 2016; Armstrong et al., 2013), the articles were ranked using citations and CPY (i.e., citations per cited paper per year), showing Nah et al. (2011) as the most influential one, while the publications of Hemp (2006) and Barnes (2007) are in second and third place respectively. The most common keywords resulted in 'virtual worlds', 'virtual reality', and lastly, 'metaverse', demonstrating a temporal shift towards the metaverse concept. Indeed, the metaverse is defined as an aggregation of virtual worlds (Hollensen et al., 2022), moving the research from singular virtual worlds (i.e., Second Life) to a multitude of platforms (e.g., Roblox).

Table 3. Top three articles per citations and cpy

Ranking (citations)	Authors	Title	Year	Source title	Country	Cited by	CPY	Ranking (CPY)
1	NAH, F. F. H., ESCHENBRENNER, B., & DEWESTER, D.	Enhancing brand equity through flow and telepresence: A comparison of 2D and 3D virtual worlds	2011	MIS Quarterly: Management Information Systems	United States	248	20,16	1 (-)
2	HEMP P.	Avatar-based marketing	2006	Harvard Business Review	United States	209	19,92	2 (-)
3	BARNES S.	Virtual Worlds as a Medium for Advertising	2007	Data Base for Advances in Information Systems	United Kingdom	57	5,18	3 (-)

Cluster and content analysis - In order to provide an in-depth understanding of the leading research areas, the 25 papers identified by VOSviewer were grouped into eight clusters. Due to the thematic fragmentation of the topics examined, a content analysis was performed by each researcher individually. Then, a discussion followed, and a reclassification into more homogeneous groups resulted in five remaining clusters. In fact, the topic “Virtual Worlds” was examined across different perspectives such as company-brand-consumer, institutions and brand value-extension. These topics were further investigated among different environments such as: real-world, 2D and 3D virtual worlds and concerning several phenomena. Ultimately, five main clusters were identified such as (1) Brand management and consumer behaviour in virtual worlds; (2) Virtual worlds as a laboratory-like environment; (3) Virtual worlds’ impact on brand-consumer phenomena; (4) Multi-perspective approach of virtual worlds’ technologies; (5) Brand Value in virtual worlds (Table 4).

Table 4 - Final clusters based on research areas

Research area	Authors
Brand management and consumer behavior in virtual worlds	Goh and Ping (2014), Jin and Lee (2010), Palomba (2020), Bames (2007).
Virtual worlds as laboratory-like environment	Belei et al. (2011), Hansen (2013), Jankowski et al. (2018), Singh et al. (2015), Cipresso (2015).
Virtual worlds impact on brand-consumer phenomena	Hassouneh and Brengman (2011), Huang et al. (2013), Melancon (2011), Ramanathan and Purani (2014), Crick (2011), Goel and Prokopec (2009), Gabisch (2011), Gabisch and Gwebu (2011).
Multi-perspective approach of virtual worlds’ technologies	Dwivedi et al. (2022), Kliestik et al. (2022), Rauschnabel et al. (2022).
Brand value in virtual worlds	Barnes and Mattsson (2011), Barnes et al. (2015), Muzellec et al. (2012), Nah et al. (2011), Pamment (2011).

The thematic areas are discussed more thoroughly as follows:

- Brand management and consumer behaviour in virtual worlds. In this group, authors mostly examined the brand-consumer relationship concerning brand experience within Virtual Worlds and potential impacts on consumer behaviour such as attitudes, gratifications, relationships, trust and satisfaction. In these cases, virtual worlds were primarily treated as another environment in which the relationship brand-consumer occurred in terms of consumer experience, and its outcomes were analysed through variables related to satisfaction, trust and loyalty (Jin and Lee, 2010; Palomba, 2020). Moreover, special attention toward advertising was observed (since gaming was one of the first virtual worlds’ experience). Scholars focused on advertising effectiveness in gaming situations treating attitude formation, and behavioural intentions (Goh and Ping, 2014; Barnes, 2007).
- Virtual worlds as a laboratory-like environment. This cluster was characterized by a particular focus on virtual worlds employed as a tool to perform experiments related to behavioural dynamics (Singh et al., 2015; Cipresso, 2015) modelling a virtual replica of real-world environments where several experimental conditions may be controlled and standardized. In addition, virtual worlds were used to analyse the effects of marketing actions, brand strategies and consumers’ responses through simulations within more manageable virtual environments (Hansen, 2013; Jankowski et al., 2018).

- *Virtual worlds impact on brand-consumer phenomena. This resulted in the most numerous cluster. In fact, most of the authors investigated virtual worlds as a relevant driver, able to influence several dynamics related to brand strategies and opportunities' creation (Ramanathan and Purani, 2014; Melancon, 2011); marketing strategies and consumer behavioural changes such as attitudes and trust (Goel and Prokopec, 2009; Gabisch, 2011; Gabisch and Gwebu, 2011). Lastly, there is evidence of a first sectorial orientation (toward tourism) to better understand how virtual worlds may affect the hospitality industry and its implications for physical places' value extension on virtual environments (Crick, 2011; Huang et al., 2013). In this cluster emerge a potential new concept such as 'metaverse marketing', that is defined here as 'the marketing practices employed in the metaverse'.*
- *Multi-perspective approach of virtual worlds' technologies. This cluster denotes a terminology shift from 3D and virtual worlds to the metaverse. Primary, this is explained by the time of the papers' publication (2022) when the term spread extensively among scholars and practitioners. Moreover, in this multi-perspective narrative, there was a focus on complexities, factors and challenges that may involve consumers (intended as users) and brands (Dwivedi et al., 2022). Also, scholars made efforts to explore the metaverse through an overview of previous literature in an attempt to define the status quo of the research by providing essential insights for future analysis of the metaverse since the phenomenon is at its hype (Kliestik et al., 2022; Rauschnabel et al., 2022).*
- *Brand Value in virtual worlds. In the last group, scholars examined virtual worlds as a factor affecting brand value. The attention focused on the development of new models to better measure the brand value in virtual worlds (Barnes and Mattsson, 2011), the identification of challenges for virtual worlds in the experiential value creation (Barnes et al., 2015), the brand value differences among 2D, 3D and real environments (Muzellec et al., 2012; Nah et al., 2011) and a first practical implication of brand value on virtual worlds related to place branding (Pamment, 2011).*

Research limitations. *This study represents one of the first attempt to provide an overview of the brand in the context of metaverse. Evaluating the novelty of the topic, it is clear as further and deep analysis are necessary to give a more complete and updated vision of this phenomena. In the practice, the most important brands are present in the metaverse but this presence still needs to be structured. The limited number of selected papers for the structured literature review provided is a concrete signal of this new line of research which will certainly grow in the coming years. The next steps could be represented by the evaluation of the further scientific contributions that will certainly be made, as well as a broader exploration of the research areas identified so far.*

Managerial implications. *From a theoretical perspective, this study suggests that future research should focus on examining two main aspects. On one hand, the consumer behaviour perspective such as attitudes, perceptions and experiences occurring on the metaverse may be considered. On the other hand, some specific fields of analysis such as tourism, education, place branding, advertising, and gaming in a metaverse context should be a future research focus. This orientation may offer opportunities to better define dynamics and differences in several environments (i.e., real, 2D, 3D). Moreover, this study offers practical implications mainly related to the use metaverse as a space to perform brand positioning strategic choices. Specifically, the metaverse can build strategies for both brand extensions and consumer journey expansion toward a new touching point, moving from a digital to a virtual world.*

Originality of the paper. *This study seeks to provide a comprehensive review of the articles dealing with brands and consumers from a 'metaverse marketing' new perspective. Despite its relevance and increasing interest, research in this area still needs to be expanded beyond a few fields of study. Therefore, future research should focus more on these unexplored topics theoretically and empirically.*

Delving into sustainability and Made in Italy fashion brands: Perspectives from Generation Z¹

FEDERICA CECCOTTI² SARA BOCCALINI³ MICHELA PATRIZI⁴
MARIA VERNUCCIO⁵ ALBERTO PASTORE⁶

Abstract

This study is situated within the literature on sustainable fashion and the Made in Italy fashion strand, with the aim to explore consumers' associations with sustainable Made in Italy fashion brands. Through three focus groups with 23 Generation Z consumers and subsequent thematic content analysis, the associations in the overlap area between sustainable fashion brands and Made in Italy fashion brands were explored. Findings showed that consumers associate the sustainable choices of Italian companies mainly with the social dimension of sustainability. Concerning the environmental dimension, Made in Italy products' aesthetics and their qualitative excellence are perceived as almost incompatible with some sustainable practices.

The study contributes to the literature on sustainable branding by focusing on the Made in Italy context for the first time. It enriches the literature on Made in Italy fashion and its sustainability transition, deepening a previously neglected standpoint, i.e., the consumer perspective. Lastly, the findings provide valuable insights to managers of Italian fashion companies engaged in sustainable transition.

Keywords: *Made in Italy; sustainability; fashion industry; focus group; Generation Z (Gen Z); thematic content analysis.*

Framing of the research. *Sustainable fashion is grounded in a philosophical framework that emphasizes sustainability principles within the fashion sector. Specifically, it aims to mitigate environmental and social impacts across the entire lifecycle of textile and apparel products, encompassing aspects such as supply chain, production, distribution, and consumption (Henninger et al., 2016). The sustainable transition of fashion brands holds significant relevance, as the fashion industry represents the most environmentally polluting industry worldwide, accounting for 8 to 10% of total greenhouse gas emissions (Gennari, 2023). Additionally, nearly 97% of fashion items originate from countries like Bangladesh and China, where workers often experience ongoing human rights violations (Montero, 2024). Based on this data, it becomes evident that fashion brands are responsible for the environment, workers, and society. Consequently, they are compelled to actively participate in sustainable initiatives to transition away from “fast fashion” practices.*

However, although pioneers such as Patagonia have led the way in adopting sustainability as a guiding principle of their business, numerous brands continue to prioritize profit maximization while minimizing costs, therefore resulting in an opaque and transient supply chain (Milano Ferri, 2024). In this regard, it is crucial for marketers to realize that adopting sustainable practices offers fashion brands the potential for long-term benefits. This entails enhancing operational efficiency and resource management, leading to extended-range cost reductions, while also increasing consumers' perceptions of the brand (Grubor & Milovanov, 2016). Indeed, 63% of consumers consider the fashion brand's promotion of sustainability to be relevant in their brand choice (Kolk, 2023). Moreover, research on branding and sustainability has shown that sustainable brand initiatives can positively influence consumer-brand evaluations. For instance, it can enhance the brand image by moving toward a more sustainable direction (Araújo et al., 2023; Parguel

et al., 2015; Chen, 2010), increase perceived brand value (Gupta et al., 2013), and shape perceived brand personality (Sander et al., 2021).

Considering the *Made in Italy* fashion context, world-renowned for its quality and style (Ceccotti et al., 2024), there is a noticeable push toward greater sustainability, thus infusing an ethical dimension alongside the intrinsic aesthetic appeal of Italian products (Fabiatti, 2015). As early as 2012, the National Chamber of Italian Fashion promoted the Decalogue on Social and Environmental Responsibility in the Fashion Industry, to steer fashion in a responsible and sustainable direction (Mortara & Fragapane, 2016). Concurrently, several iconic *Made in Italy* fashion brands have incorporated sustainability into their activities. For example, Giorgio Armani has been involved in humanitarian projects since 2006 (e.g., *Product Red*, *Acqua for Life*) and, with the launch of the Armani Values website in 2022, constantly communicates its social and environmental commitments to consumers (Armani Values, 2024). Considering the historical impact of *Made in Italy* on both domestic and international fashion markets (Terenzi & Benelli, 2021), exploring consumer perceptions of Italian fashion brands transitioning toward sustainability sends a positive signal also to international fashion companies. In this regard, although data suggests that three out of four Italian consumers born between the 1990s and 2010s prioritize a brand's sustainable practices in their choices (Valleriani, 2022), the emerging literature on sustainable *Made in Italy* fashion brands fails to address consumer perceptions of their sustainable transition. For instance, Tebaldi and colleagues (2022) investigated, from a managerial standpoint, the factors that drive companies to adopt eco-friendly practices, along with the levels of implementation and performance of these initiatives. Similarly, other studies have examined case studies of Italian companies to identify sustainable best practices within the supply chain of the Italian fashion system (Terenzi & Benelli, 2021), as well as how the Italian fashion value chain has responded to the COVID-19 crisis through digitalization (Di Maria et al., 2023). Only the case study by Ceccotti and colleagues (2024) provided the first integrated view of the values of *Made in Italy* with sustainability (economic, environmental, and social), by analyzing an iconic Italian fashion company that has embarked on a sustainable path. However, the current research has not yet explored consumers' perceptions of *Made in Italy* brands that are implementing sustainable social and environmental activities.

Purpose of the paper. Exploring the consumers' associations with sustainable *Made in Italy* fashion brands holds significant importance within the outlined context. Firstly, it elucidates the evaluative consumer's responses achievable from *Made in Italy* brands that embrace sustainability. Additionally, it can provide valuable guidance to Italian fashion companies in formulating brand positioning and communication strategies. Moreover, given the potential impact of *Made in Italy* fashion on international market dynamics (Terenzi & Benelli, 2021), this research can motivate other international brands to adopt sustainable practices to enhance consumer perceptions.

Therefore, by merging the literature on sustainable fashion branding and the strand of *Made in Italy* fashion, this study aims to explore the associations that consumers attribute to sustainable *Made in Italy* fashion brands.

Methodology. Given the exploratory nature of our research objective, we employed a qualitative methodology centered on focus group discussions involving individuals from Generation Z. This approach, widely utilized in marketing research, serves to uncover insights into consumer behavior and illuminate areas of inquiry that have received relatively little attention (Jenkins & Harrison, 1990; Fernqvist et al., 2015). Furthermore, focus groups provide valuable insights into respondents' cognitive, emotional, and behavioral responses, which are often difficult to capture through methods like questionnaires or observations (Gibbs, 1997). Moreover, Krueger and Casey (2009) highlighted that in a focus group, participants engage in a dynamic social environment where they interact and exchange ideas. Unlike individual interviews, focus groups allow for the organic emergence of insights as participants actively shape and contribute to the discussion. Indeed, the interactive nature and social context of focus groups encourage the emergence of diverse perspectives (Gibbs, 1997), with participants often prompting one another to consider new issues (Lawless & Heymann, 2010), shedding light on shared perceptions, attitudes, and behaviors (Morgan, 2002). Leveraging interactions among participants, focus groups enable data triangulation and validation, as converging experiences and perspectives bolster the credibility and reliability of research outcomes (Stewart et al., 2007).

We have chosen to concentrate on Gen Z consumers due to their well-recognized enthusiasm for fashion and their notable impact on the industry (Cassidy, 2019). In their decision-making process, they are drawn to brands that align with their core values, particularly those emphasizing sustainability (Cassidy, 2019). Indeed, this generation is frequently acknowledged as one of the most environmentally and socially conscious, exhibiting a strong preference for fashion brands that prioritize environmentally friendly production, ethical labor practices, and transparency in the supply chain (PwC, 2020). Moreover, Generation Z is driving the demand for circular fashion models, which include initiatives such as clothing rental services, second-hand marketplaces, and clothing recycling programs (McKinsey & Company, 2021). This inclination also extends to *Made in Italy* fashion brands, renowned for their commitment to craftsmanship and environmental stewardship (McKinsey & Company, 2021).

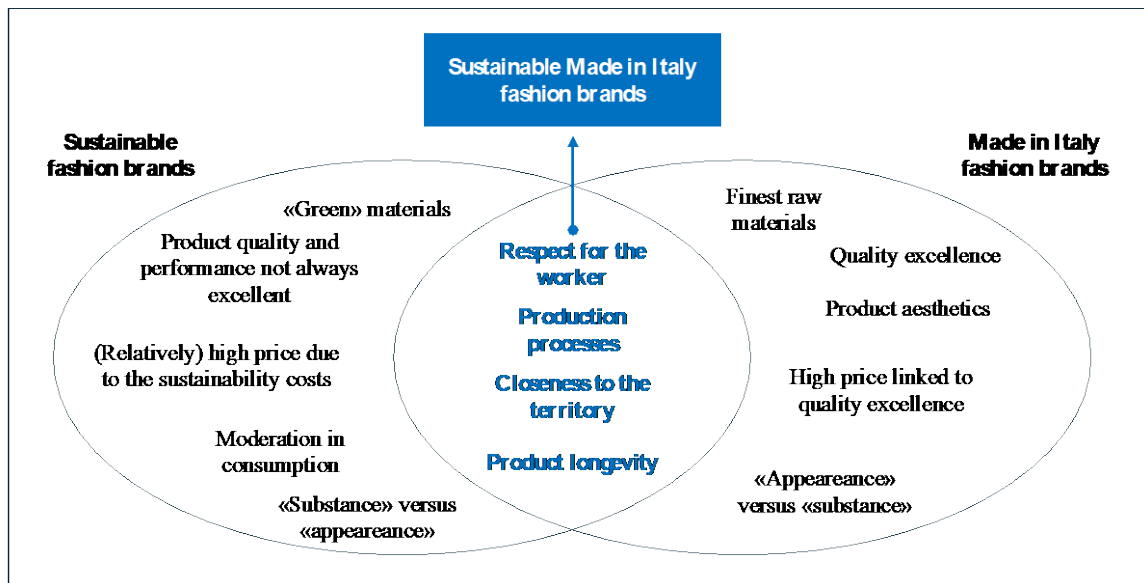

Concerning data collection, participants were initially contacted via email and were invited to participate in the study by completing a self-reported questionnaire. The questionnaire included a screening question to confirm the participants' age, asking, "Are you born between 1996 and 2005?". It also sought to detect the level of importance of *Made in Italy* fashion brands in purchasing choices (e.g. "When you choose a piece of clothing, how important is it to you that it is a *Made in Italy* branded product?") and the sustainable orientation of consumers in the fashion industry. Specifically, sustainability orientation was measured by adapting the 14-item scale developed by Roth & Robbert (2013) to the fashion context (e.g., "It is important to me that fashion companies reduce their emissions"). Adopting a purposive sampling strategy, we recruited Generation Z individuals with high mean values for interest in *Made in Italy* and sustainability orientation. Accordingly, 23 respondents were involved, 17 women and 6 men, aged between 21 and 27, both workers

and students. The three focus groups were conducted in a dedicated room within the Department of Management and took place in November 2023. The discussion guide followed a process of “cyclical development” (Gillham, 2005, p. 22), which reinforced the validity and transparency of the analytical process. The discussion guide's topics first concerned the associations that participants linked to the concept of sustainable fashion brands and then to Made in Italy fashion to identify the overlap area and delineate the perception of sustainable Made in Italy fashion brands. The focus groups, each lasting approximately two hours, were recorded and analyzed through thematic content analysis (King & Horrocks, 2010). To verify the reliability of the analysis, the coding process was performed separately by two members of the research team and subsequently compared. Furthermore, the results were confirmed by two independent expert coders, revealing a satisfactory “ratio of agreement” (i.e., 88%).

Results. The analysis of the three focus groups showed only partial convergence between the participants' associations with sustainability in the fashion industry and the specific characteristics of Made in Italy fashion brands (Figure 1). To obtain a deeper understanding of this overlap area, we will describe the following:

1. The unique associations that are commonly linked to sustainable fashion brands,
2. The unique associations that are commonly linked to Made in Italy fashion brands,
3. The shared associations between sustainable fashion and Made in Italy fashion brands, as perceived by Gen Z consumers who participated in the three focus groups.

Figure 1- Sustainability and Made in Italy fashion brands: The overlap area

1. Sustainable fashion brands

Concerning the unique associations with sustainable fashion brands, the following themes emerged:

- (a) Use of "green" materials such as organic fibers, natural colors, and recycled materials, not from animal exploitation (such as leather, fur and feathers), leading to products that do not harm the environment and society;
- (b) Product quality and performance not always excellent: The choice of sustainable raw materials (e.g., fibers made from food or recycled plastic and eco-leather) can lead to products that sometimes are not aesthetically beautiful and high-performing (e.g., in terms of comfort in use, durability, or softness of fabrics): "Environmental sustainability in clothes makes me think of faded colors, dark brown recycled cardboard labels, and the narrowness of the assortment" (Participant 4, Group 2). Another participant echoed this, saying: "Real leather bags give a whole different feeling than eco-leather bags that are more rigid instead" (Participant 5, Group 2);
- (c) (Relatively) high price to cover the higher costs related to the choice of raw materials and packaging and, above all, to respect workers' conditions. In participants' perception, the price is not necessarily high in absolute terms, but in comparison with that of fast fashion products;
- (d) Moderation in consumption. From the participants' point of view, this theme holds two different meanings. The first is reducing the purchase of large quantities at low prices in favor of more reasoned purchases of sustainable products: "We have been used to buying and wearing clothing almost in disposable mode. This routine is no longer possible; we cannot continue to compulsively buy clothes, even if they are cheap, to use them once, and that is it" (Participant 5, Group 2). On the other hand, one aspect that is emerging as relevant in the participants' perceptions is the extension of product life and recycling of products (i.e., second hand): "We need to take advantage of the garments we have until the end of their useful life, without getting overwhelmed by the logic of the continuous search for low-priced varieties. If they no longer serve us, they can serve others, so why not sell them to keep them alive?" (Participant 6, Group 2);

(e) “Substance” versus “appearance”: in the case of sustainable fashion brands, consumers prioritize the impact their clothing choices have on the environment and society over product aesthetics. As a result, they are willing to compromise on product quality, pay higher prices, and even buy fewer garments, rather than continuing to support the fast fashion industry's constant search for new styles.

2. Made in Italy fashion brands

From the analysis of the participants' associations with the Made in Italy fashion brands, the following themes emerged:

- (a) Sophisticated and finest raw materials used to make excellent and durable products;
- (b) Quality excellence: Thanks to the use of fine materials and, as will be discussed, production processes that are still partially artisanal, Made in Italy fashion is "a guarantee of superior quality throughout the world, quality not only in raw materials but also in processes that take great care of all details, such as stitching, packaging, etc." (Participant 6, Group 2);
- (c) Product aesthetics, related to the style, design, and attention to detail (i.e., quality of stitching) of fashion garments offered by Italian companies. "Made in Italy is recognized as beautiful and well made all over the world" (Participant 3, Group 1);
- (d) High price, associated with the high quality of products, style, design, and the awareness of many Made in Italy brands, and only to a lesser extent with the higher costs of sustainability (especially on the social front, connected with respect for workers' conditions);
- (e) "Appearance" versus "substance": the consumer choice is driven by style and the high awareness of Made in Italy fashion brands recognized worldwide. In participants' perceptions, choices driven by product aesthetics (i.e. by "appearance") are almost in opposition to those driven by sustainability (i.e., by "substance"): "Beauty is sometimes associated with superficiality because everyone can appreciate it without too much effort. Sustainability is a different matter. To appreciate it, you must have the will to inform yourself and seek the best solution for you, the environment, and society" (Participant 7, Group 3).

3. Sustainable Made in Italy fashion brands

Several respondents had some difficulties combining the values of sustainability with those of Made in Italy fashion. Indeed, many participants said that the superiority of Made in Italy productions today is still not wholly linked to sustainability: "I think sustainability and Made in Italy in fashion are still disconnected concepts; I have a struggle to put them together" (Participant 5, Group 1). Another participant echoed this consideration: "Made in Italy is still not fully focused on sustainability. Maybe in a few years it will be, but not now" (Participant 1, Group 1). Also, "Not all quality brands, such as Made in Italy fashion brands, are necessarily sustainable, just as it is not that all brands that claim to be sustainable are qualitatively superior to others" (Participant 4, Group 1).

More specifically, the use of "green" raw materials is considered by some participants to be almost not compatible with the high-quality standards and aesthetics of Made in Italy fashion products: "If I buy a Made in Italy fashion product, it is because I am looking for something beautiful, that is of high quality. I believe these characteristics are not found in sustainable products that use eco-friendly materials. Consumers buy the latter for other reasons, not because they are beautiful and high quality" (Participant 6, Group 2). Another participant shared the same opinion: "Certainly, products made from 'green' organic fibers do not stand out in terms of beauty, while Italian fashion products are precisely recognized worldwide for taking care of aesthetic aspects. Are we sure that aesthetics and sustainability are compatible? In my opinion, not at the moment" (Participant 5, Group 2).

More often, in the perception of many participants, there is a spontaneous association between Made in Italy and the social dimension of sustainability. Indeed, delving into the area of intersection between sustainable fashion brands and Made in Italy fashion brands, the following common themes emerged:

- (a) Respect for the worker: in contrast to the dynamics of fast fashion, focus group participants emphasized that one of the defining aspects of sustainable Made in Italy fashion brands is the attention to the quality of workers' conditions and working environments: "I associate Made in Italy with the guarantee that workers cannot be exploited. I take it for granted" (Participant 3, Group 3). In the participants' perception, this is true for companies that still adopt artisanal processes (such as small and medium-sized ones) and for larger companies that nonetheless stand out in the global fashion industry for their attention to the well-being of their human resources;
- (b) Production processes, that are characterized by increasing attention to waste reduction in resource use and care in product disposal, as well as attention to detail at every stage of the materials' transformation;
- (c) Closeness to the territory and the communities they belong to from which they often draw skilled workforce: "The territory becomes part of the company's storytelling. For example, Brunello Cucinelli and Tod's come to my mind: they are firms strongly rooted in a specific area to which they want to give something of what they have built back" (Participant 2, Group 2);
- (d) Product longevity, which is linked to the high quality and artisanal nature of production: in this sense, Made in Italy fashion products are "naturally" associated with sustainability, as they are expected to last longer than those characterized by a lower level of quality. Participants also link the longer life of products to the possibility or willingness to repair them.

Research limitations. *This study has some limits that suggest avenues for further research. Limitations primarily relate to the nature of qualitative research and the focus group method. While generating deeper insight into phenomena, the findings are restricted to small numbers of Generation Z individuals, providing findings that cannot be generalized across populations. Consequently, further research should be done to involve other generational groups, like Gen-Y, Gen-X, and/or Baby Boomers, as well as verify our results by applying quantitative approaches (e.g., surveys or experimental studies). This study also focused on fashion brands. Future research should verify whether our results are generalizable to different Made in Italy sectors investing in sustainability, such as furniture and automotive. Moreover, given that many Made in Italy fashion brands are at the beginning of their sustainable transition and are investing in building a sustainability-based positioning, it might be helpful to replicate the study over time to observe the effects of these investments on consumer perceptions in the medium term.*

Managerial implications. *The results of our study could provide valuable insights to managers of Italian fashion companies engaged in sustainable transition. First, Made in Italy fashion companies should continue strengthening their positioning based on the social sustainability dimension, communicating their closeness to the territory and attention to workers' well-being. Given that many of the processes in Made in Italy fashion are still artisanal, company employees could also be central in the storytelling of the qualitative excellence of Italian products, which are carefully crafted down to the smallest detail, from the choice of raw materials to the different phases of the production process.*

Second, the perceived distance found by the participants between environmental sustainability in the choice of raw materials and the aesthetics and quality of the products leads to a relevant challenge: indeed, firms should work to combine beauty and style with "green" raw materials and ecological production processes without betraying the promise of quality excellence guaranteed by Made in Italy productions. This result could initially be achieved through investments in packaging, an integral part of the product system, as many Made in Italy companies already do on labels and packaging, and then try to intervene more directly on the product itself. In addition to using green materials, companies could focus investment on adopting production processes that can reduce the impact of fashion on the environment while enabling them to maintain the high quality of the products.

Finally, another important activity to consider could be consumer education for moderation through communication campaigns that can lead consumers to reflect on the value of Made in Italy fashion products and the opportunity to extend their useful life or give them a second life. Consumer education through communication, especially toward younger generations such as the one involved in our study, could also help lead to more conscious choices in the purchase of clothing, not only related to the aesthetic value of the product (i.e., the "appearance") but also to the contribution that product can make to reducing the environmental and social harms of fashion (i.e., the "substance").

Originality of the paper. *Our exploratory study stands at the intersection of research on sustainable fashion branding and studies on Made in Italy fashion, contributing to both fields through an investigation of the associations that consumers attribute to sustainable Made in Italy fashion brands. Specifically, our findings reveal first the values that consumers associate with sustainable brands, such as the use of green raw materials and premium prices directly supported by previous literature on sustainable fashion branding that investigates consumers' underlying values and motivations for sustainable fashion consumption (e.g., long-lasting, natural materials, recycled, environmentally friendly production techniques) (Lundblad & Davies, 2016). Second, consumers' associations with Made in Italy fashion, such as the qualitative excellence, aesthetics and high price, emerge from our study, in line with prior studies identifying attributes such as creativity, aesthetics, quality, and sophistication (Temperini et al., 2016). Focusing on the primary objective of our study, the results unexpectedly highlight a challenge in identifying perceptions related to both Made in Italy and sustainable fashion brands. While unambiguous associations with sustainable Made in Italy fashion emerge, such as respect for workers and connections to the territory and community supported by previous studies from a managerial perspective that identify social responsibility as an integrated value between sustainability and Made in Italy fashion (Ceccotti et al., 2024), significant contrasts also arise. Particularly, differences are evident regarding product aesthetics, a trait that, although naturally linked with Made in Italy fashion, does not extend to sustainable fashion brands in the consumer's perception. This finding aligns with broader discussions in the literature, which identify product aesthetics as a significant factor contributing to the attitude-behavior gap in eco-fashion (Niinimäki, 2010). Another relevant difference is related to the concept of quality. Indeed, qualitative excellence that characterizes Made in Italy fashion cannot automatically be linked to sustainable practices, just as adopting a sustainable approach does not necessarily lead to obtaining qualitatively superior products. On the contrary, our study highlights that consumers perceive high quality as not fully and consistently compatible with environmental sustainability when using "green" raw materials. This result aligns with previous studies in the wider fashion industry that measured consumer disgust with garments made with recycled plastic, perceived as contaminated (Meng & Leary, 2021).*

Therefore, our work first contributes to the field of sustainable branding by focusing for the first time on the associations that consumers attribute to a sustainable brand in the specific context of Made in Italy, which has not been studied so far and which could play a central role in the sustainable transition of national and international fashion brands. At the same time, this study enriches the literature on Made in Italy fashion and its transition to sustainability with the consumer perspective, a previously neglected standpoint compared to the managerial one (Ceccotti et al., 2024; Di Maria et al., 2023; Tebaldi et al., 2022; Terenzi & Benelli, 2021).

Drinking with eyes: how colors elicit consumers' taste expectations of coffee

DANIELE PORCHEDDU¹ RAFFAELE CAMPO² PIERFELICE ROSATO³ FABRIZIO PIU⁴

Abstract

Research on sensory marketing reveals that the interactions between sight and the other senses is particularly powerful. Specifically, this paper is focused on the role of colors and their impact in affecting consumers' taste expectations towards coffee. The researchers, by considering some previous studies, have presented 4 visual stimuli (white cup, orange-reddish cup, cream colored cup and red cup) and 5 different flavors (aroma intensity, creaminess, degree of caffeine, sweetness, degree of temperature), in a lab experiment involving 300 participants. By applying an inferential analysis, conducted through the one-way between subjects ANOVA, we found that red is the most indicated to arouse pre-conceptions of the aroma intensity, caffeine-content and temperature. Implications and limits are further discussed.

Key words: sensory marketing; consumers; coffee; colors; taste; vendor machine

Framing of the research. Scientific literature shows how research on the relationships between the senses and marketing is growing (Auvray and Spence, 2008), specifically, colors are relevant for food choice (Clydesdale, 1993), as well as beverages (Zellner and Durlach, 2003) and represent a relevant element which affect consumers' taste expectations (Spence, 2024). This is evident in some studies. Carvalho and Spence (2019), verified the role of cup color on perceived coffee taste, finding that pink (versus white) generated a sweeter perception and less acidity. Interestingly, Reinoso-Carvalho et al. (2017) demonstrated that beverages with different colors but same taste may stimulate different expectations, in particular their study was focused on beers. According to Koch and Koch (2003) colors create pre-concepts on taste. Specifically, they investigated the role of colors (red, green, blue, yellow, orange, brown, purple, grey, white and black) on soft drinks. In terms of results, red and orange were associated with sweet taste, white with salty taste, yellow and green with sour taste. Likewise, a connection emerged between yellow and orange to citrus taste, brown to syrup taste and red, orange, yellow to the fruity taste. no color was positively associated with the fizzy "taste". On the contrary, in terms of negative associations, there were the following results:

- the colors green, brown, gray and black were not associated with sweet taste;
- blue, red, white and black were not associated with sourness;
- red, blue, gray and white were not connected to bitterness;
- nine out of ten colors were not perceived as salty (except white);
- red and brown were not connected to citrus taste;
- grey, white and black were not linked to syrup taste;
- grey, white and black were not perceived as fruity;
- brown, red, black and gray were not linked to the fizzy taste of alcohol-free drinks.

As highlighted by Guéguen and Jacob (2014), the color of the container could influence the evaluation of drink. They carried on the following experiment: each participant was invited to enter a room and, on a table, they could find four identical cups, different exclusively for their color (blue, green, yellow and red). Furthermore, the room was subjected to constant temperature control, which had to remain at 23° C. In each cup the drink served - Colombian coffee - had to have a temperature of 40° C and between the various cups the portions of coffee had to be identical. The researchers found that the red cup was considered the one with the hottest drink, followed by yellow green and, finally, blue. The aforementioned results provided strong experimental support for the hypothesis that the color of the container can influence the perception of the temperature of a drink. They also proposed to increase the perceived heat of drinks by

using red cups, also considering the fact that this mechanism could reduce energy consumption and, therefore, the quantity of electricity consumed by bar managers and restaurants, consequently reducing some costs.

Another interesting experiment was organized by Risso et al. (2015). The experimental study indicated therein demonstrated that the color of a plastic glass can influence both the perception and the expectation of mineral water taste. The experiment was divided into different tests, each having a different focus but, in any case, constantly linked to the color of the container. The first was used to evaluate the aspects of pleasantness, freshness and lightness of the three types of mineral water considered, all through the use of specific visual analogue scales. For the aforementioned first test, the types of water used were: natural, lightly carbonated and carbonated. In addition, plastic cups with three different colors were used: white, red and blue. Through the experiment number two, expectations were analysed, taking into account only the color of the container, without the possibility to taste the liquid. With regards to the experiment number one it emerged that the sample perceived water as more carbonated if contained in a red or blue plastic glass, unlike what happened if it was contained in a white glass. Instead, with the second test it was demonstrated that the participants expected the sparkling water contained in a blue glass to be less carbonated than the same water contained in a red or white glass. Likewise, participants expected the water in a white glass to be cooler than that served in a red plastic glass.

Piqueras-Fiszman and Spence (2012) studied the impact of colors on the consumption of hot chocolate. Each individual involved had to drink four hot chocolates, which were contained in four glasses (different colors-same dimensions). The colors used were cream, in a dark variant, reddish-orange, white and red (colors were chosen because they are the most commonly used both in vending machines and on sale in shops). Results revealed that color of the glasses had a significant impact on the liking of hot drinks. Specifically, the intensity of the flavor of the drink was rated higher when the latter was served in a reddish-orange cup. However, cream-colored glasses were preferred for the aroma of chocolate and supported the perception of sweetness. Moreover, cream-color did not appear to be connected to bitterness.

Another study which inspired our experimental design is the one by Van Doorn et al. (2014), whose analysis was focused on coffee with milk. In particular, three cups were used, in three versions (transparent, white and blue) and different in materials. The experimentation was divided into two distinct, but still connected, tests. The first experimental test involved eighteen volunteers aged between 18 and 62: they had to consume 200 ml of milky coffee. Then, the participants were divided into three groups of six members each: the first group was given the white porcelain cup; the second was given the transparent glass cup; the last group was given the blue porcelain cup. Due to the small size of the sample considered for the first experiment, in order to avoid possible errors, it was decided to proceed with a second test. In experimental test number two it emerged that the type of cup used exerted a significant influence on the participants' evaluation of the perceived sweetness of the coffee and milk. This test involved thirty-six volunteers aged between 17 and 66 and they also had to drink 200 ml of milky coffee obtained by combining 135 ml of whole milk and 65 ml of coffee. Twelve people were given a glass cup with a white rubber band; twelve other people were given a glass cup with a blue rubber band; the last twelve adherents were given a clear glass cup.

The second test demonstrated that the milky coffee was perceived significantly as less sweet when served in the white cup. So, both experiments demonstrate that the color of a container can influence people's evaluations of the taste of a hot drink. In addition, in both studies, the statistically significant results concerned the use of the white cup. In this regard, as a possible reason, the possible effect given by the chromatic contrast between the color of the cup and that of the coffee was taken into account: indeed, the white cup could have influenced the perception of the brown of the milky coffee. As a consequence, it is possible to state that the color of the cups could influence the multisensory experience in force during the moment of consumption of hot drinks.

Finally, a relevant research was carried on by Maga (1974) whose study was aimed at understanding the possible interaction between colors and the four basic tastes through an experiment conducted with colored water. For the experimental test, the colors considered were red, green, yellow and colorless and the tastes were salty, sour, bitter and sweet. The "aqueous solutions" used for the research were made with agents such as sodium chloride, sucrose, citric acid and caffeine and the quantity of chemical substance was diluted with demineralized water which, depending on what was required by the different steps of the experiment, could be colorless or colored red, green or yellow by adding tasteless dyes. As a consequence of this study, Maga (1974) clearly demonstrated that color could influence the ability to distinguish the four basic tastes and, also, identify the psychological role in the association between foods and colors. Furthermore, Maga noted that the sample considered did not associate the yellow color with the sweet taste; green color led to an increased sensitivity to sweetness, while the red color did not influence it. On the other hand, both yellow and green decreased sensitivity with regards to sourness.

Purpose of the paper. Inspired by some studies, this research is aimed at shedding light to the role of colors for Italian consumers, with particular reference to coffee, whose consumption is a custom in Italy. For this reason, the researchers want to explore how colors can impact on taste expectations, with implications for those small firms that sell coffee (bars and cafeterias).

Methodology. This is a lab experiment involving 300 participants (199 females, 101 males). The visual stimuli was represented by images depicting a vending machine with a cup of coffee in the foreground.

The images used during the experiment were originated from an original image, appropriately modified for experimental purposes using computer graphics software. In order to have different versions, both the color and the container itself represented in the images were manipulated in the various experimental groups. This was the original visual stimulus:

Fig.1: The original stimulus

Source: <https://www.canteen.com>.

Continuing with the explanation of the use of the original real image, through Photoshop CS6, we proceeded to create four images “gemmed” from the real image. Each “gemmed” image differed from the original only in terms of the glass color; in terms of position, in each version the glass is in the foreground.

In particular, our visual stimuli (the glass) were 1) white, 2) orange-reddish color, 3) cream color and, finally, 4) red. These colors were selected on the basis of the experiment carried on by Piqueras-Fizman and Spence (2012). The participants were randomly assigned to one of the following 4 groups:

- Group n. 1 = people exposed to the image with the white cup;
- Group n.2 = people exposed to the image with the orange-reddish cup;
- Group n. 3 = people exposed to the image with the cream-colored cup;
- Group n. 4 = people exposed to the image with the red cup.

Then, every participant had to fill a short questionnaire. Each participant was asked to answer questions about:

- degree of aroma intensity attributed to the coffee (Q1);
- degree of creaminess attributed to the coffee (Q2);
- degree of sweetness attributed to the coffee (Q3);
- degree of caffeine attributed to the coffee (Q4);
- degree of temperature attributed to the coffee (Q5).

Every question was organized as a Likert-scale one, with scores from 1 to 7.

On the basis of previous studies, our hypothesis are:

Hp.1: The cream-colored disposable cup is the one that “conveys” the preconception of intensity of aroma of the coffee dispensed better than the others.

Hp.2: The color of the disposable cup has no bearing on the preconception of creaminess of the coffee dispensed.

Hp.3: The disposable cream-colored cup is the one that “conveys” the preconception of sweetness of the coffee dispensed better than the others.

Hp.4: The white disposable cup is the one that “conveys” the preconception of a high caffeine content in the coffee dispensed better than the others.

Hp.5: The red disposable cup is the one that “conveys” the preconception of the high temperature of the coffee dispensed better than the others.

In our experiment, the manipulated independent variable is represented by the color of the coffee cup illustrated on the image the participants were exposed to; the dependent variables, in addition, are represented by the ratings expressed on the Likert-scale by the participants.

It is fundamental to underline that the evaluations given by the participants were expressed in the same context and in the same conditions, except for the color of the cup of coffee in the foreground.

The evaluations expressed by the participants, then, were merged into a database and were subjected to a One-way between subjects ANOVA, considering the color of the disposable coffee cup as the between-subjects factor.

In the presence of a significant ANOVA we were led to think that at least one of the means referring to the experimental groups was significantly different from the others and it was necessary to proceed with post-hoc tests.

In particular, to identify which treatment modality (which color of the coffee cup) the significantly different medians referred to, we proceeded by comparing them two by two (pairwise comparison) by applying the Bonferroni method.

We used the software SPSS, v.17.0.

Fig.2: The colored cups

Source: Our elaboration with Photoshop

Result. First of all we have collected data about the average values of the evaluations expressed by the participants, which shows some differences

Table 1: Average values

Colors/Questions	Q1	Q2	Q3	Q4	Q5
White	4,27	4,28	3,87	4,25	5,04
Orange-reddish	4,47	4,08	3,79	4,12	4,69
Cream	3,84	4,10	3,92	3,90	4,32
Red	4,97	4,40	3,80	5,08	5,48

For each of the questions from Q1 to Q5, these are the results of the inferential analysis conducted through the one-way between subjects ANOVA:

- with reference to question Q1: we calculated a value of the statistic $F(3, 296)=6.084$; $p<0.01$; this test was therefore highly significant and the post hoc tests revealed, in pairwise comparisons, statistically significant differences between some levels of the treatment (the color of the disposable cup) about the ability to arouse the idea of aroma intensity in observers; in particular, the red color proved to be the best performing from the point of view of its ability to arouse pre-conceptions of the aroma intensity of the coffee dispensed;
- with regards to Q2, we calculated a value of the statistic $F(3, 296)=0.570$; this test was therefore not significant. We did not detect differences in the ability of the colors to “convey” the preconception of creaminess of the coffee dispensed;
- regarding question Q3: we calculated a value of the statistic $F(3, 296)=0.96$; this test was also not significant. Essentially, we found no differences in the ability of the colors to “convey” the preconception of the sweetness of the coffee dispensed;
- question Q4: we calculated a value of the statistic $F(3, 296)=7.527$; $p<0.01$; this test was therefore highly significant and the post hoc tests revealed, in pairwise comparisons, statistically significant differences between some levels of the treatment (the color of the disposable cup) in the ability to arouse the preconception of a high presence of caffeine in observers; in particular, the color red is the most associated one with the idea of caffeine. However, we did not find any differences between the remaining colors;
- finally, referring to question Q5: we found a value of the statistic $F(3, 296)=6.361$; $p<0.01$; this test was therefore highly significant and the post hoc tests revealed, in pairwise comparisons, statistically significant differences between some levels of the treatment (the color of the disposable cup used to serve the coffee) in the ability to “convey” the temperature preconception of the drink served at the observatories. In particular, the color red proved, from this point of view, to be the best performing among the colors compared.

For 3 questions out of 5 these differences were also statistically significant at the usual levels of first type error.

In particular:

1. with reference to the preconception of aroma intensity (see question Q1), the color of the best performing disposable cup was red; this result does not support Hp.1 (formulated on the basis of Piqueras-Fiszman and Spence, 2012).
2. regarding the preconception of creaminess (Q2), none of the colors compared seem to show an ability to “convey” this variable better than the others; this result is consistent with Hp.2 (formulated on the basis of Piqueras-Fiszman and Spence, 2012).
3. with reference to question Q3 (relating to the preconception of the sweetness of the coffee dispensed), equally, none of the colors compared seem to show an ability to “convey” this characteristic better than the others; this result does not support Hp.3 (formulated on the basis of Piqueras-Fiszman and Spence, 2012).
4. regarding question Q4 (referring to the preconception of caffeine contained in the coffee dispensed) the best performing color was red; this result does not support Hp.4 (formulated on the basis of the study by Van Doorn, Wullemijn and Spence, 2014).

5. finally, regarding question Q5 (referring to the preconception of temperature of the drink dispensed), the best performing color was, once again, red; Incidentally, this result is in line with Hp 5, which was formulated starting from the study by Guéguen and Jacob (2014).

Research limitations. The results just summarized were obtained during a laboratory study, in a “ceteris paribus” context in which several potential confounding variables were controlled.

These variables are so called because they are able to (potentially) affect the cause-effect relationships between the independent variable (in this case, the color of the cup) and the dependent variable of interest from time to time (we refer to the dimensions referred to questions Q1 to Q5 of our Questionnaire).

Given the experimental nature of our work, the degree of internal validity of our results can be considered high; however, there may be problems with the generalizability of the results of our study. In particular, the external validity of our results could be reduced by the non-representativeness of the sample of participants compared to the Italian population that uses coffee vending machines on a daily basis; other problems could arise from the “non-ecological” context in which the experimental task was carried out.

Managerial implications. We can affirm that the color of the disposable cup used to dispense coffee is capable of arousing preconceptions on the part of observers regarding a series of characteristics that we have examined. The results lead us to think that the color of the disposable cup chosen to dispense the coffee can significantly influence some preconceptions relating to the drink (we are referring, in particular, to dimensions such as the intensity of aroma, the caffeine content and the temperature of the drink).

In light of the above, those who manage automatic coffee vending machines should take into account that certain colors perform better than others, as long as they want to “convey” certain characteristics of the coffee being dispensed. The choice of color of the disposable cup therefore seems to influence preconceptions relating to some characteristics of the drink in question. Preconceptions, on the other hand, are important precursors of perceptions of product characteristics, influencing, albeit in probabilistic (and non-deterministic) terms, the processes of choice and repetition of purchases and consumption by customers.

To conclude, from our study it clearly emerges that the red color is the most appropriate for the disposable cup if you want to emphasize the dimension of the intensity of the coffee aroma and its temperature.

On the other hand, since red is the color most strongly associated with the idea of caffeine, it appears the least suitable when you have to dispense decaffeinated coffee through the vendor machine.

Originality of the paper. The original contribution of this paper is to apply three different studies to an Italian context, which needs more research on this kind of studies. Moreover, given that coffee is a rite in Italy, this is particularly relevant for catering firms.

Aging and social influence: An empirical investigation of the effect of age on consumers' susceptibility to word of mouth*

ALESSANDRO M. PELUSO¹ ANTEA GAMBICORTI² GIOVANNI PINO³ MIHAELA GIANNELLI⁴

Abstract

The present research investigates the relationship between consumers' age and their susceptibility to word of mouth (WOM), that is, their tendency to rely on WOM in their purchase decision-making. Two empirical studies shed light on this relationship and explore a potential underlying mechanism involving consumers' sense of control. Study 1 (N = 450) shows that consumers at older ages feel a greater lack of control, and this feeling in turn increases their susceptibility to WOM. Study 2 (N = 150) provides further evidence for the central role of sense of control by showing that the aforementioned mediated relationship is stronger among consumers with a higher chronic desire for control, that is, those who are particularly motivated to pursue control over their lives and thus may perceive a significant decline in their sense of control due to aging. Interestingly, both the studies reveal a residual negative relationship between age and susceptibility to WOM, suggesting that the examined relationship may be complex and other mediators might intervene to explain why, in specific circumstances or for certain consumer segments, susceptibility to WOM might decrease, rather than increase, with age. Theoretical, policy, and practical implications are discussed.

Keywords: aging; older consumers; WOM; lack of control; consumer susceptibility; chronic desire for control

Framing of the research. Industrialized countries are witnessing a deep demographic transformation due to population's aging compared to a decline in birth rate (Drolet and Yoon, 2021; Guido, 2018). This demographic shift is leading to significant changes in the proportion of older individuals (i.e., those aged 65 and older; Amatulli et al., 2018; Berg and Liljedal, 2022) compared to other age groups (Laukkanen et al., 2007). For example, it is estimated that by 2050 the percentage of older individuals will make up 29% of the total population (PopulationPyramid.net, 2023). Consequently, this age group may become a relevant segment for companies (Kennett, Moschis, and Bellenger, 1995; Lambert-Pandraud, Laurent, and Lapersonne, 2005), which should thus consider attitudinal and behavioral differences across age groups. In parallel with this demographic transformation, information sources are growing more and more, with consumers being increasingly exposed to a wide range of marketing communications: from traditional advertising to interpersonal communications and user- or AI-generated content (Barreto, 2014; Longoni, Cian, and Kyung 2023). In this context, one aspect that is worth exploring is how aging affects consumers' use of information sources. For example, prior research suggests that, compared to their younger counterparts, older consumers are more conservative in their adoption of new communication channels. In contrast, young consumers are more likely to use the Internet for collecting information about products and services (Lopez and Sicilia, 2011). Furthermore, older consumers seem to prefer detailed messages with extensive information, while younger ones seem to prefer shallow messages that go straight to the point (Guido, 2018; Iyer, Yazdanparast, and Strutton, 2017).

Nonetheless, little is known about older consumers' susceptibility to word of mouth (WOM), namely, the extent to which they are persuaded by information about goods, services, and companies that is typically exchanged among consumers in both online and offline contexts (Westbrook, 1987). WOM is one of the most relevant sources of information in today's markets, with approximately 70% of consumption decisions being influenced by this type of communication

(Balter, 2008). However, empirical evidence on how consumers differently react to WOM communications as a function of their age is mixed and inconclusive. For instance, Lopez and Sicilia (2011) state that age differences do not affect consumers' susceptibility to WOM, while East, Uncles, and Lomax (2014) support the idea that older consumers are less influenced by WOM due to their social isolation, which reduces their exposure to this form of communication. Instead, Iyer, Yazdanparast, and Strutton (2017) show that, compared to their younger counterparts, older consumers are more susceptible to WOM messages provided in their preferred communication modes, which are face-to-face and telephonic conversations; however, this difference could be partially overcome when WOM messages are communicated by a peer. Despite valuable, these preliminary findings seem inconclusive about the role of age in consumers' susceptibility to WOM. Therefore, the present research tries to fill this gap by exploring the psychological process underlying the relationship between consumers' age and their susceptibility to WOM.

Prior literature on aging and consumer behavior suggests that, as consumers age, they tend to strengthen their beliefs, thus increasingly relying on habits (Lambert-Pandraud, Laurent, and Lapersonne, 2005; see Guido, 2018, for a review), resisting innovations (Laukkanen, 2016), and expressing change aversion (Wallach and Kogan, 1961). As a result of this tendency, consumers at older ages are less inclined to change their mind and preferences, remaining loyal to their favorite brands (Lambert-Pandraud, Laurent, and Lapersonne, 2005). In general, this resistance to change might stem from older consumers' progressive deterioration of information processing capacity, due to a progressive decline in cognitive, physical, and relational abilities (Kennett, Moschis, and Bellenger, 1995). Considering these cognitive and behavioral patterns, it is feasible that older consumers (i.e., 65 years and older), compared to their younger counterparts, are more cautious in revising their beliefs and preferences and, consequently, less susceptible to information about products, brands, or companies that other people provide in the form of WOM (East, Uncles, and Lomax, 2014).

Despite the plausibility of this prediction, one more counterintuitive possibility is that consumers at older ages are more susceptible to WOM. As preliminary evidence for this possibility, research by the University of Cambridge's Dignity Project (Dignity Project, 2020) shows that consumers aged 65 years and older tend to rely more on WOM as a primary source of information. Consistent with this idea, Carrigan, Szmigin, and Wright (2004) found that, despite older consumers' perception of television and press as more reliable information sources, WOM from friends and family predominantly influences their purchasing behavior, especially in health and well-being (Gibler, Lumpkin, and Moschis, 1998). Taken together, these prior findings suggest that older consumers might be more susceptible to WOM. Yet, little is known about the potential mechanism underlying such a possible relationship. The current research hypothesizes that a possible mechanism is a decline in the sense of control, which may contribute to explaining why consumers at older ages may be more susceptible to WOM.

Sense of control is the belief that the events and the outcomes in life are the consequences of one's own actions (Mirowsky and Ross, 1989). This aspect has been described in the extant literature by using various definitions, such as internal locus of control (Rotter 1966), personal efficacy (Downey and Moen, 1987), personal autonomy (Seeman, 1983), and primary control (Heckhausen et al., 2010). Prior studies have documented a negative relationship between age and sense of control, so that individuals tend to lose their sense of control as they age (Heckhausen et al. 2010; Heckhausen and Farruggia, 2003; Lang and Heckhausen, 2001). Indeed, with aging, individuals' health and physical functioning deteriorate; thus, their perceived ability to control their lives and the surrounding environment decreases, generating greater challenges for such individuals and increasing their vulnerability (Heckhausen et al., 2010).

Lack of control typically leads individuals to engage in compensatory strategies to restore their sense of control (Beck et al., 2020; Landau, Kay, and Whitson, 2015; Peluso et al., 2017). For example, consumers experiencing a low sense of control tend to seek structured consumption (e.g., they prefer products with sharp edges) and show a preference for products that require a lot of personal effort (e.g., items for physical activity) to feel more competent in achieving desired results (Cutright, 2012; Cutright and Samper, 2014). Another interesting compensatory strategy implemented by individuals is described as "agentic shift", intended as "delegating" decision-making responsibility about their choices and behaviors to external sources, allowing others to decide for them (Fennis et al., 2012). Indeed, when individuals have a lower sense of control, they experience a higher need for input from others. In such a situation, they not only become more open to taking advice (Tost et al., 2012) but also tend to act according to what other individuals say (Fennis et al., 2012). Based on this reasoning, we hypothesize that consumers at older ages feel a greater lack of control, and this feeling increases their susceptibility to WOM. Thus, lack of control should serve as a mediator in the relationship between age and susceptibility to WOM, explaining why older consumers may become more open to social influence, in general, and to WOM communications, in particular.

Purpose of the paper. In this research, we explore the complex relationship between age and susceptibility to WOM. Based on prior literature on aging, consumer behavior, and sense of control, we hypothesize a two-faced relationship between age and susceptibility to WOM, which includes both a negative path (consumers at older ages are less susceptible to WOM) and a more intriguing, positive path mediated by control (consumers at older ages feel less in control and thus are more susceptible to WOM), which is the main focus of this research. We tested this relationship in two distinct studies. Specifically, Study 1 is designed to test whether consumers at older ages feel a lower sense of control, and this feeling, in turn, is associated with higher susceptibility to WOM. Then, Study 2 digs deeper into this control-based mechanism. Building on the notion that such a mechanism should be magnified among consumers who chronically seek to be in control over their environment (Burger, 1992; Peluso et al., 2017), Study 2 tests the moderating role of consumers' chronic desire for control (Burger, 1992), which is a personality trait that captures the extent to which individuals are generally motivated to control the events that happen in their lives (Burger and Cooper, 1979). Consistent with this

reasoning, Study 2's results show that, as consumers age, those with a higher (vs. lower) chronic desire for control experience a more pronounced perception of lack of control and, consequently, an increased susceptibility to WOM.

Study 1: Methodology. Four hundred fifty consumers ($M_{Age}= 49.27$, $SD_{Age}=20.44$, 227 males) were recruited in a midsized Italian city to participate in a survey study during Fall 2019 and Winter 2020. Data were collected by three trained interviewers blind to the study's goal. Although the interviewers adopted a convenience sampling procedure, allowing respondents to participate in the study on a voluntary basis, the data set adequately covered all ages (age range: 18-96 years). After some filler questions (e.g., "How many times in a week do you go to the supermarket?"), the participants were asked to complete a three-item seven-point Likert scale drawn from Ferguson and Goodwin (2010) to assess respondents' perceived lack of control (e.g., "I often feel that most situations are out of my control"; 1 = strongly disagree, 7 = strongly agree). Subsequently, they were asked to indicate their susceptibility to WOM by answering three items (e.g., "How much do you rely on advice and opinions of others when making purchases?"), which were adapted from Iyer and Mitch (2021) and assessed on a seven-point rating scale (1 = not at all, 7 = very much). Finally, the participants provided data about their gender (0 = male, 1 = female), year of birth, education level (1 = less than high school, 2 = high school diploma, 3 = bachelor's degree, 4 = master's degree or higher), and income level (1 = less than €20,000, 2 = €20,000 - €39,999, 3 = €40,000 - €59,999, 4 = €60,000 - €79,999, 5 = €80,000 - €100,000, 6 = over €100,000).

Study 1: Results. The three items assessing perceived lack of control ($\alpha = 0.80$) and the three items assessing susceptibility to WOM ($\alpha = 0.91$) were combined to constitute two aggregated measures of the respective constructs (lack of control: $M = 3.78$, $SD = 1.46$; susceptibility to WOM: $M = 3.32$, $SD = 1.46$). Then, we estimated a mediation model using the PROCESS SPSS Macro (Model 4) by Hayes (2022), in which susceptibility to WOM served as the dependent variable, lack of control was the mediator, and age was the independent variable. Therefore, we first regressed lack of control on age. The results revealed a significant positive relationship between these two variables ($b = 0.009$, $p = 0.005$), suggesting that older consumers experience a greater lack of control. Then, we regressed susceptibility to WOM on lack of control, controlling for age. The results showed a significant positive relationship between lack of control and susceptibility to WOM ($b = 0.194$, $p < 0.001$), suggesting that consumers who feel less in control rely more on WOM. Interestingly, the analysis also showed a significant negative relationship between age and susceptibility to WOM ($b = -0.020$, $p < 0.001$), which was compatible with the two-faced nature of the relationship between these two constructs. To test the predicted mechanism based on control, we estimated the indirect effect of age on susceptibility to WOM via lack of control, which was positive and significant ($b = 0.002$, 95% confidence interval [CI] = 0.0004, 0.0037). Repeating the analysis by adding gender, education level, and income levels as covariates did not change our substantive results.

Overall, this study's results support the idea that older consumers are more susceptible to WOM, and this age-related effect is driven by a reduced sense of control. This study sheds light on the complex relationship between age and consumer susceptibility to WOM. More specifically, this positive control-mediated path competes with a negative path, whereby consumers at older ages may be less susceptible to WOM, likely due to an overreliance on their beliefs and preferences. In the subsequent study, we dig deeper into the positive path by exploring the moderating role of chronic desire for control in the relationship between age and lack of control. However, we acknowledge that the negative path also deserves further investigation (an exploration of possible mechanisms underlying this negative path is currently in progress).

Study 2: Methodology. This study is designed to provide converging evidence for the central role of sense of control in the relationship between age and susceptibility to WOM, by testing whether the control mechanism is magnified among consumers with a higher chronic desire for control. More specifically, in this study, we used a completely different sample from that employed in Study 1 to show that older consumers perceive a greater lack of control and, consequently, are more susceptible to WOM. However, this perception is stronger among those who chronically desire to be in control over their environment as compared to those with lower levels of this desire. To this end, one hundred fifty consumers ($M_{Age}= 51.35$, $SD_{Age}=22.08$, 67 males) were recruited in a midsized Italian city to participate in a survey study during Spring 2022. Data were collected by a trained interviewer blind to the study's goal, using the same sampling procedure as in Study 1 to cover all ages (age range: 20-90 years). The questionnaire used the same measures as in Study 1, plus a three-item measure of chronic desire for control drawn from Peluso et al. (2017) and assessed on a seven-point Likert scale (e.g., "I enjoy having control over my own destiny", 1 = strongly disagree, 7 = strongly agree).

Study 2: Results. We averaged the scores of the three items assessing chronic desire for control ($\alpha = 0.73$), the three items assessing lack of control ($\alpha = 0.77$), and the three items assessing susceptibility to WOM ($\alpha = 0.93$) to constitute aggregate measures of the respective constructs (chronic desire for control: $M = 5.65$, $SD = 1.20$; lack of control: $M = 3.70$, $SD = 1.36$; susceptibility to WOM: $M = 3.44$, $SD = 1.47$). Then we estimated a moderate mediation model (Model 7 in the PROCESS SPSS Macro; Hayes, 2022), in which susceptibility to WOM was the dependent variable, lack of control served as mediator, age was the independent variable, and chronic desire for control was the moderator of the relationship between the independent variable and the mediator. We first regressed lack of control on age, chronic desire for control (mean-centered), and their interaction. The results revealed a significant positive effect of age ($b = 0.024$, p

< 0.001), confirming what emerged in Study 1, and a significant positive effect of chronic desire for control ($b = 0.209$, $p = 0.014$). More importantly, the analysis revealed an interaction effect of age and desire for control on lack of control ($b = 0.008$, $p = 0.088$). Despite its marginal significance, we decomposed this interaction effect by estimating the effect of age on lack of control at lower ($M - 1SD$) and higher ($M + 1SD$) levels of the moderator. As expected, the effect of age on lack of control was marginally significant for consumers low in chronic desire for control ($b = 0.015$, $p = 0.052$) and significant and stronger for those high in this individual characteristic ($b = 0.033$, $p < 0.001$). Subsequently, we regressed susceptibility to WOM on lack of control by controlling for age. The results revealed a significant positive relationship between lack of control and susceptibility to WOM ($b = 0.358$, $p < 0.001$), and a significant negative relationship between age and susceptibility to WOM ($b = -0.014$, $p = 0.019$). Finally, we estimated the indirect effect of the interaction term (age \times chronic desire for control) on susceptibility to WOM via lack of control, which was significant at a 90% level (index of moderated mediation: $b = 0.003$, 90% CI = 0.0001, 0.006). The indirect effect of age on susceptibility to WOM via lack of control, estimated for those with a lower chronic desire for control ($M - 1SD$; $b = 0.005$, 95% CI = 0.0002, 0.011), and the same effect, estimated for those with a higher desire for control ($M + 1SD$; $b = 0.012$, 95% CI = 0.004, 0.022), were both significant, yet the latter was more than double the former in size. Adding gender, education level, and income levels as covariates in the model did not change our substantive results. Despite the marginal significance of the index of moderated mediation and the related conditional indirect effects, taken together this study's results are compatible with our theorizing and thus provide further support to it.

Research limitations. The present research encompasses three main limitations that provide opportunities for future studies. First, it provides preliminary evidence for the central role of sense of control in the complex relationship between age and susceptibility to WOM, by demonstrating that older consumers feel less in control and, as a result of this feeling, are more influenceable by external information provided by others in the form of WOM. Coherently with our reasoning, the central role of sense of control is magnified among those who put high importance on their own ability to control the environment out of a chronic desire to do so. Importantly, our two studies provide evidence that the relationship between age and susceptibility to WOM is a complex one since it seems to be driven by two competing mechanisms that operate in the opposite direction. Therefore, to shed further light on this relationship, future studies could explore other potential mediators (e.g., social isolation, cognitive rigidity; East, Uncles, and Lomax, 2014) that might elucidate the mechanism underlying the residual negative relationship between age and susceptibility to WOM, which has received relatively little attention in the present research. Secondly, our two studies focused on Italy. Even if this country represents an ideal setting, as the Italian population is aging at an increasing pace due to a rise in life expectancy and a reduced fertility rate (Italian National Institute of Statistics, 2022), future studies could try to generalize our findings to other countries. Thirdly, we acknowledge that surveys allow a partial understanding of consumers' attitudes and behaviors because of the correlational nature of data. Future studies could adopt experimental techniques to establish cause-effect relationships among the variables of interest. Such experimental techniques might be useful to test the effectiveness of potential interventions aimed at making older consumers feel more in control, thus mitigating their susceptibility to WOM and, by extension, to external social influence.

Managerial implications. Our results provide relevant insights for companies and policymakers. For companies, older consumers represent an important marketing segment, due to their higher disposable income compared to young consumers and their substantial presence in the population (Drolet and Yoon, 2021). Therefore, it becomes of interest to advance our understanding of how older consumers behave in the market (Amatulli et al., 2018). Our results revealed that consumers at older ages may be more susceptible to WOM. This suggests that companies may rely on this form of interpersonal communication to inform older consumers about their products and services, in addition to relying on traditional communication tools, such as newspapers and television. However, the psychological mechanism of lack of control that drives older consumers' higher susceptibility to WOM raises important questions related to their potential vulnerability to persuasive attempts in the form of offline and online messages, with implications in terms of their capability of recognizing deception and untruthful information (Guido, 2018). In this respect, this research sheds initial light on potential drawbacks deriving from older consumers' lack of control and susceptibility to external information. Companies and policymakers should consider such drawbacks to develop policies that can help older consumers feel more in control.

Originality of the paper. To the best of our knowledge, the present research represents the first attempt to understand the mechanisms underlying the complex relationship between age and consumers' susceptibility to WOM. Although prior literature suggests a seemingly negligible relationship between these two constructs (e.g., Lopez and Sicilia, 2011), the present research is the first to introduce the idea that susceptibility to WOM may significantly vary with consumers' age. This phenomenon has been previously overlooked because its outward nonsignificant relationship; however, this research indicates that it is instead characterized by two mechanisms that operate in the opposite direction. Consistent with this idea, our findings provide preliminary, yet promising, evidence that this relationship incorporates potentially competing mechanisms that may lead older consumers to be differently susceptible to WOM and social influence in general, depending on individual and contextual factors. On one hand, our findings demonstrate that the positive effect of age on susceptibility to WOM is driven by perceived lack of control, which pushes them to rely more on external information. Thus, we clarify the role of sense of control, by contributing to the literature on aging and social influence. On the other hand, our findings hint at the possibility that, parallel to this positive mechanism, there are other intervening factors that might explain the residual negative relationship between age and susceptibility to WOM, paving the way for further exploration of the relationship between these two variables and contributions to the growing literature on the so-called silver economy (e.g., Colurcio, Vigolo, and Edvardsson, 2022).

The rise of Phygital Reality: insights from Structural Topic Modelling

DANIELE VIRGILLITO¹ FRANCESCO RUSSO² ALESSIA MUNNIA³ MARCO ROMANO⁴

Abstract

Latest technological advancements enabled to go beyond digitalisation, offering opportunities to combine physical and digital realities in a hybrid phygital one, with the potential to disrupt several activities. The aim of this work is to conduct an explorative literature review on the emerging topic of phygital reality. We employed Structural Topic Modelling, a text mining methodology, to analyse data retrieved from Web of Science and Scopus databases. The analysis led to the identification of seven thematic areas that allow to gain a broad understanding of phygital applications in different contexts: (1) Metaverse, (2) Health Technology, cultural heritage and gaming, (3) Fashion & Luxury, (4) Customer experience, (5) Education, (6) Tourism, (7) Retail experience. The study provides some clarity on the exploitation opportunities of phygital reality and identifies a gap concerning the phygital applications to enhance social inclusion toward some disadvantaged and marginalised segments, thus providing insights on business opportunities to fill this gap.

Key words: *phygital, text mining, structural topic modelling, social inclusion*

Framing of the research. *Covid-19 pandemic led consumers worldwide engage in exercise, shopping and socialisation activities from their own homes, thus accelerating an already existing trend. These habits partially survived even after the acute phase of pandemic had passed, encouraging the development of a “phygital reality” (Schneider, 2021).*

The phygital combines two types of realities: the traditional physical one and the digital one (Mele et al., 2023). The term describes the social interactions taking place at the intersection between physical and digital contexts (Mele & Russo-Spena, 2022) based on the combination of physical and digital contents (Gelsomini et al., 2021). Phygital experience originally dealt with retail, but it was subsequently developed in fashion and banking industry (Ballina et al., 2019). Phygital is however an overarching phenomenon that leverages technological breakthroughs in the field of computing, artificial intelligence, augmented reality and virtual reality to transform many of our daily activities, from work and study to travel and entertainment, toward the integration of virtual environments in real life. Research on this topic is still in its infancy and embraces different fields. The aim of this work-in progress study is to review existing literature on phygital applications by applying structural topic modelling (STM) methodology, in order to make some clarity on the main research streams and identify some gaps to be filled by future research. The remaining of the manuscript is organised as follows: a methodology section represents the main steps taken collect data and conduct the STM analysis, a results section presents and discusses the main topics identified, and eventually we highlight the limitations, managerial implications and the originality of our work.

Methodology. *We retrieved all the papers pertaining to the subject of interest by searching for the term “phygital” in the Web of Science and Scopus databases. Both searches were limited to works published only in English, with no specific time frame. There were 324 records retrieved in total. We decided not to restrict the search to a specific publication type because, given the exploratory nature of the study and the novelty of the topic, it was deemed appropriate to be as inclusive as possible at this stage of the research.*

Next, we used KNIME Analytics to carry out the text mining procedures, implementing the standard stages of text pre-processing on the extracted abstracts (Tursi & Silipo, 2018). Initially, we removed the repeated entries, resulting in a final sample size of 196 observations. Next, we eliminated stop words and non-descriptive words based on their low word frequency, and then we used the Kuhlen Stemmer. Ultimately, we constructed the bag of words by taking into account all the individual words and the most occurring bi-grams.

In order to get the main themes that may effectively summarise the content of the 196 abstracts, we used the Structural Topic Modelling (STM) approach developed by Roberts et al. (2019). STM, like the Latent Dirichlet Allocation (LDA) model introduced by Blei et al. (2003), enables the summarization of a collection of texts into a set of themes. Each topic is described by a list of terms, and each document is assigned a probability of belonging to each subject (Blei et al., 2003). In LDA, it is believed that all documents have the same distribution of themes (topic prevalence). On the other hand, in Structural Topic Modelling (STM), each document is estimated to have a unique distribution of topics, and the model also allows for correlation between topics. When determining the best number of topics, four factors may be taken into account: exclusivity, semantic coherence, held-out likelihood, and residual variance. In our scenario, exclusivity implies that the best answer is achieved by selecting between 6 and 11 topics. Semantic coherence is achieved with fewer than 7 topics. The held-out probability is achieved with between 6 and 11 topics. The residual variance is around 13 topics. Next, we assessed three potential options for subjects: 6, 7, and 8. Ultimately, we chose the second option since it was simpler to read and had less instances of overlapping themes in terms of their real significance.

Results. The table below provides a concise summary of the subjects and keywords that have been identified.

Table 1: Identified topics and keywords

Topic 1	Topic 2	Topic 3	Topic 4	Topic 5	Topic 6	Topic 7
business	data	consumer	brand	development	approach	behavior
concept	design	customer	consumer	digital	art	customer
digital	digital	customer-experience	consumption	education	cultural	dimension
emerg	game	design	experience	educational	digital	experience
future	information	engagement	fashion	generation	experience	play
metaverse	interaction	experience	luxury	learn	innovation	positive
potential	physical	journey	online	proces	museum	retail
technology	robot	market	product	student	social	service
virtual	space	physical-digital	retail	support	tool	store
world	system	strategy	strategy	teacher	tourism	technology

The following subsections provide a discussion of the identified topics.

Topic 1: Metaverse

The convergence of physical and digital realms, commonly known as “phygital”, has received significant scholarly attention in recent literature, particularly regarding its integration with the expanding concept of the metaverse (Omarali, 2023). As a result, new mechanisms of value creation and capture at the intersection of physical and virtual economies emerge in the metaverse (Mancuso et al., 2023). Technological developments are expected to introduce a new organization to physical and virtual socio-spatial relations, as well as new socio-technological groups (Hamurcu, 2022).

The new human dynamics will be a seamless integration of both physical and digital realms, known as phygital (Sui & Shaw, 2022). The pandemic has accelerated the shift towards phygital marketing, with social media and e-commerce playing a crucial role (Silvia et al., 2023). Scholars have explored various applications of this integration across different domains, including retail. Particularly, they have focused on an innovative approach to consumer behaviour (Johnson & Barlow, 2021; Silva & Cachinho, 2021). Existing literature emphasizes the transformative potential of using the metaverse to enhance user engagement and interaction by adding digital overlays to physical spaces (Chrétien-Ichikawa, 2022; Ioannidis & Kontis, 2023; Tse & Pun, 2024). It explores the hybridization of marketing tools, including phygital omnichannel promotion and contactless sales across new digital frontiers. Additionally, it examines the implementation of the empirical concept in world trade activities (Nozdreva et al., 2023); research has shown how retailers can use the metaverse to create immersive shopping experiences that combine digital product visualization with physical store environments, potentially transforming the retail industry (Mengalli et al., 2023). In addition to the need to measure how customers find, interact with, and consume content and images, the metaverse ecosystem has identified the need to optimize relationships with consumers in order to mitigate purchase difficulty gaps (Davies et al., 2024; Mengalli et al., 2023). Furthermore, the education sector has recognized the potential of the metaverse to facilitate immersive learning environments where students can engage with educational content in a dynamic and interactive manner, such as in a game (AydoÄydu et al., 2021; Guga, 2015). Likewise, the entertainment industry is at the leading edge of embracing digital metaverse experiences, allowing users to participate in interactive stories beyond the boundaries of traditional media (Del Vecchio et al., 2023; Giovannini & Bono, 2023; Russo et al., 2024). A number of studies highlight that these integrations are capable of transforming industries such as retail, entertainment, education, healthcare, etc (Terenzi & Vignati, 2021). While the literature acknowledges the myriad opportunities presented by phygital metaverse applications, it also highlights several challenges and considerations. Concerns about privacy, ethical implications, and technological limitations emerge as critical factors that warrant the attention of the scientific community.

Topic 2: Health Technology, cultural heritage and gaming

Researchers have investigated various applications of phygital technologies, including wearable devices, remote monitoring systems, augmented reality (AR) and virtual reality (VR) interventions (Bini et al., 2023) related to healthcare industry. These technologies have the potential to transform healthcare delivery by improving patient engagement, enabling personalized interventions, and optimizing clinical workflows. The convergence of virtual, augmented, mixed,

and extended reality, mobile tools, the Internet of Things, and artificial intelligence has enabled the growing symbiosis between human spaces and computers. This is leading to the emergence of mixed physical and digital ecosystems that will have a transformational impact on people's lives (Gaggioli et al., 2023).

The potential role that phygital systems could play in enhancing mental health and well-being is still under investigation (Spitale et al., 2019). By simulating realistic healthcare scenarios and providing immersive experiences, these technologies can enhance learning outcomes, improve patient comprehension of complex medical concepts, alleviate pain and anxiety during medical procedures, and support people with intellectual disabilities (Gelsomini et al., 2021). Wearable devices equipped with biometric sensors allow for real-time monitoring of vital signs and health parameters, which can facilitate early detection of health issues and empower individuals to proactively manage their well-being (Gennari et al., 2023; Sayem et al., 2023; Schiavi et al., 2023). The literature emphasizes the significance of human-centered design principles and interdisciplinary collaboration in developing effective phygital healthcare solutions (Barresi et al., 2023). By integrating insights from fields such as human-computer interaction and psychology, researchers can design intuitive and user-friendly interfaces that enhance usability and acceptance among healthcare providers and patients alike (Gelsomini et al., 2021).

Research in this topic has explored the potential of phygital gaming experiences to engage audiences with cultural heritage artifacts, sites, and narratives, linking health, heritage, and gaming, discovering the transformative effects of such experiences (Andrade & Dias, 2020; Cirafici et al., 2022). The integration of augmented reality, virtual reality, and mixed reality (MR) with gaming platforms allows users to explore virtual reconstructions of historical sites, interact with digitized artifacts, and participate in narrative-driven experiences that bring the past to life (Bollini, 2022; Borsotti, 2022; Marra et al., 2023; Turco & Giovannini, 2020), especially those that are inaccessible due to restoration work (Hallot et al., 2021). AR can provide additional layers of information to support physical exhibitions while also extending the knowledge produced beyond the art gallery's boundaries.

This highlights the immersive qualities of extended reality technologies and the phygital future that is emerging in the exhibition space (Brusaporci & Maiezza, 2021; Crossley et al., 2023). Researchers have explored the role of phygital gaming in fostering cultural understanding, empathy, and appreciation among diverse audiences. This transcends geographical and temporal boundaries, facilitating meaningful connections with heritage resources (Prajapati & Das, 2023). Moreover, the literature emphasizes the significance of collaborative and participatory approaches in developing phygital gaming experiences. This involves engaging stakeholders, such as cultural institutions, game developers, scholars, and community members, in the co-creation process (Lupetti et al., 2018; Piumatti et al., 2017; Praticò et al., 2019).

Topic 3: Fashion & Luxury

Phygital retailing blends the physical and digital worlds to create unique customer experiences. Papers included in this topic have examined how luxury fashion brands are using phygital approaches to create immersive and cohesive brand experiences that seamlessly integrate physical and digital touch points. While the applications of phygital retailing are on the rise, there is still a lack of understanding of what factors can influence customer experience, particularly hedonic factors (Banik & Gao, 2023). Through initiatives such as virtual fashion shows and interactive digital installations, brands can extend their reach beyond traditional brick-and-mortar stores and engage global audiences in innovative ways. With the increase in consumers' online and offline interactions, there is a greater need for marketers to prompt integrated customer experiences. This can be achieved through online and offline interactions (Lee et al., 2023). Phygital marketing is characterized by its focus on the quality of consumer experiences, but few papers have explored how neuroscience can be used to study these experiences (Johnson & Barlow, 2023). Additionally, the literature emphasizes the importance of phygital technologies in enhancing the exclusivity and desirability of luxury fashion products. These technologies enable brands to provide personalized and customized experiences that appeal to affluent consumers (Jacob et al., 2023). Some research questions explore how human interactions with experienced salespeople contribute to the value of the phygital experience (Samy Soliman & Erakat, 2023). Omnichannel retailing has transformed retailers' strategies for engaging customers in making purchase decisions (Mikheev et al., 2021). Contemporary luxury marketing literature addresses the research gap by explaining the role of phygital functionality in enhancing relationship building, social engagement, and trust and commitment development, resulting in a seamless customer experience and enhanced loyalty and patronage (Pangarkar et al., 2022). Researchers have explored the implications of phygital strategies for brand storytelling. They emphasize the importance of authenticity and heritage in conveying the brand's values and identity across digital platforms (Banik, 2021). Moreover, recent literature emphasizes the importance of luxury fashion brands implementing an omnichannel strategy that seamlessly integrates both online and offline channels to provide a cohesive and uninterrupted shopping experience for consumers (Mele et al., 2021). Current research aims to explore innovative ways in which luxury fashion brands can leverage phygital approaches to enhance brand equity, foster consumer loyalty, and drive sustainable growth in an increasingly digitized marketplace.

Topic 4: Customer experience

Consumers are nowadays accustomed to shift from physical to digital settings and the availability of phygital spaces opens up to novel opportunities to further enrich customer experience (Ballina et al., 2019). The spread of phygital environments has contributed to fill the gap between online and offline along the entire customer journey to deliver an enhanced customer experience, relying on the use of smart technologies (Mele & Russo-Spena, 2022).

Part of the literature included in this topic is focused on luxury customer experience. The intrinsic characteristics of luxury industry (high quality of physical products emphasised by ideals of legacy and craftsmanship as well as the services provided) make it look as mismatched with anything linked to digitalisation (Black, 2022). However, it is actually hugely impacted by the implementation of phygital solutions for enhanced interactions with customers (Kumar, 2023; Pangarkar & Shukla, 2023).

In this topic, research has evidenced the underlying mechanisms of the impact of phygital on customer experience. A key factor is represented by the medium used to provide services and interact with customers during the purchase process, such as mobile applications (Lawry, 2023; Silva e Sousa et al., 2022). Some studies deal with experience-related characteristics that make it phygital, such as the sense of touch simulation in a dematerialised environment (Ornati & Kalbaska, 2022) and phygital connectedness, intended as the tendency of consumers to showcase their physical experience with the product on social media networks (Kumar, 2023). Another aspect highlighted by scholars is the impact of phygital on customer relationship management performance metrics such as customer satisfaction, loyalty and retention (Mishra et al., 2023).

Topic 5: Education

The phygital environment is playing a key role in the digitalisation process of education, significantly accelerated by covid-19 pandemic (Fazzin, 2022; Zaitseva et al., 2023), which raised the need for remote or distance learning (Distefano, 2023), at all levels, from primary and higher education to university and beyond (Fazzin, 2022). Phygital education is the integration of traditional classroom methods with digital learning, thus going beyond the digital education practices developed during pandemic and restructuring the educational process in such a way that the role of both students and teachers is transformed (Zaitseva et al., 2023). It particularly fits students belonging to Generation Z, also known as phygital generation (Tolstikova et al., 2021). Scholars in the education field have started to investigate whether teaching effectiveness can increase in a phygital mode (Chaturvedi et al., 2021).

Literature evidences that phygital environments can innovate the educational process in different ways. It introduces new educational practices, based on the use of smartphones to foster socialization and collaborative learning (Fonseca & Mealha, 2022) as well as on the adoption of phygital textbooks to support an immersive learning experience to enable collaborative active learning (Prajapati, 2023). As emerges from the literature, the implementation of phygital learning practices can also take place by including gaming technologies in the educational process, providing students with the opportunity to train and rehearse their skills in a simulation environment (Zaitseva et al., 2023), also with the support of augmented reality (Chaturvedi et al., 2021). Education gamification in phygital environments is also reported as an effective solution for students with special educational needs (especially those aged between 5 and 12 years, for whom the border between physical and digital disappears), delivering a playful learning experiences by means of specific Apps (Goretti et al., 2020).

Some studies shed light on possible benefits of phygital education. Phygital solutions can therefore guide education towards enhanced inclusiveness, addressing the risk of digital exclusion for students with special needs (Efthymiou, 2023; Hemdan et al., 2023). In addition to being more inclusive, another great potential of phygital education highlighted in literature which however requires further investigation, is personalisation (Chaturvedi et al., 2021).

Topic 6: Tourism

The potential of the phygital environment in tourism industry mainly concerns the delivery of enhanced tourist experience. Tourists can indeed benefit from a dual physical-virtual world in a new experiential model that allows them to explore in an immersive and interactive way (Clemente et al., 2024)

A stream of literature evidences that phygital solutions are becoming increasingly popular in cultural institutions. Many studies in this topic provide examples of phygital applications in museums (Baldi, 2022; Baratta et al., 2022; Debono, 2021; Zhuang & Zheng, 2023). The phygital formula in such contexts represents a means to co-create cultural value (Clemente et al., 2024). The need for museums to implement phygital strategies and deliver phygital experiences has increased during pandemic but even post-pandemic scenarios involve the possibility to rely on phygital experiences. These scenarios may consist in offering a digital version of the physical tour or complementing the physical tour with some digital contents (Debono, 2021). As evidence by Clemente et al. (2024), some internationally popular museums such as Louvre (France), British Museum (UK), National Gallery (UK), National Museum of China (China) and Metropolitan Museum of Art (USA) have already implemented augmented/virtual reality based exhibitions and immersive tours as well as digital environments. Such solutions improve accessibility, enrich the visit and visitors' engagement, also allowing to personalise the visit with specific human-like interactions. According to the authors, such solutions contribute to the four dimensions of phygital experience: extended socialisation, extended self, extended sensation and extended setting. In some contexts, such as wine tourism, the phygital mode can be exploited to deliver an enjoyable learning experience concerning specific aspects tourist may be curious about (e. g. learn how to prune the vines wearing a virtual reality helmet instead of listening to the traditional explanations by winemakers), without losing human contact and relationship with tourists (Lorey et al., 2023).

By implementing a moderate digital approach to guide the physical visit can enhance the tension of artworks and expand the space for public discourse and the creation of game mechanisms that assign missions and roles to the public in a phygital manner, generates excitement and better engages participants. However, an excessive use of sensory stimulation may cause cognitive difficulty and result in negative user experience. The right balance should be found in

establishing a multi-dimensional dialogue relationship between “Person-Content-Object-Field” (Zhuang & Zheng, 2023).

Research in this stream also highlights the impact of the hybridisation of physical and digital components on destination performance, in terms of experience co-creation (Sustacha et al., 2022), tourists satisfaction and the overall competitiveness of smart tourist destinations (Ballina et al., 2019), destination recovery and resilience (Muangasame & Tan, 2023).

Topic 7: Retail experience

Retailers can improve customer engagement, facilitate informed decision-making, and enhance the overall shopping experience through initiatives such as interactive fitting rooms, virtual product try-on experiences, and personalized digital signage (Kumar et al., 2024). Publications included in this topic have examined how phygital technologies, including interactive displays, can be leveraged to create immersive and engaging retail environments that seamlessly blend online and offline interactions (Roten & Vanheems, 2023). The literature also emphasizes the importance of phygital strategies in addressing key challenges facing the retail industry, including showrooming, omnichannel integration, and declining foot traffic in physical stores. Due to mass customization, retailers cannot present all possible configurations in-store for customers to experience. In addition, consumers are shifting to online shopping (Van Rheden et al., 2023). Retailers can bridge the gap between digital convenience and physical touch, offering consumers the best of both-while driving brand loyalty and advocacy. Phygital customers’ needs and expectations that are satisfied through in store technologies and to detect the in store strategies that use these technologies to make the store attractive and experiential (Bonfanti et al., 2023). Furthermore, the impact of these technologies on consumer behaviour is explored, with emphasis on the role of sensory stimulation, emotional resonance, and social interaction in shaping purchase decisions and brand perception; to enhance the phygital customer journey and shopping experience, retailers aim to meet customers’ needs for utilitarian, hedonic, social, and playful experiences. These approaches increase gratification and emotions towards the acceptance of phygital retail, using user-generated content (Ray et al., 2023).

The literature analysed also highlights the importance of retailers adopting a customer-centric approach to phygital retailing, prioritizing seamless integration, personalized experiences, and data-driven insights to meet the evolving needs and preferences of the modern consumer. The in-store experience for customers can be enhanced through the use of phygital devices that showcase the appeal of technology to consumers. Retailers can leverage these perceptions to improve the overall retail experience (Boudkouss & Djelassi, 2021).

Current research has focused on understanding the long-term impact of phygital retail experiences on consumer satisfaction, brand loyalty, customer satisfaction, and business performance, as well as innovative strategies to maximize the potential of phygital technologies in driving retail innovation and competitiveness (Guzzetti et al., 2024; Lecointre-Erickson et al., 2021).

Research limitations. The study has some limitations. We conducted an extensive literature search to encompass all aspects of the topic, which resulted in the inclusion of some less scientifically rigorous document types in the sample (i.e. conference proceedings and book chapters). However, this was deemed appropriate at this explorative stage to conduct a broad investigation of such an innovative domain. Future developments of the research may address this limitation, applying additional filters to the research.

Managerial implications. The study provides some clarity on the exploitation opportunities of phygital reality and identifies a gap concerning the phygital applications to enhance social inclusion toward some disadvantaged and marginalised segments, thus providing insights on business opportunities to fill this gap.

Originality of the paper. The paper addresses a novel emerging topic for which research is still at its infancy, by applying a robust methodology to provide an overview of the state of the art. The findings show that a relevant outcome of phygital applications is represented by enhanced user and customer experience in different fields (luxury consumers, tourists, students). An overarching common thread that links some of the topics between each other is represented by the theme of inclusion. The phygital reality is indeed able to prevent some segments of students from being excluded as well as enables smart engagement strategies of various types of customers and tourists. However, phygital literature still lacks specific contributions able to unveil how the presence of phygital realities can enhance social inclusion, cultural participation and digitalization, by reducing marginalization and creating the conditions for better institutions, trust and social capital that in turn foster social cohesion and social sustainability. Future research may address this gap, investigating how phygital allows to enhance social inclusion toward some disadvantaged and marginalised segments (e.g. migrants, NEETs, the unemployed, older adults, cultural minorities, women, persons with disabilities, and those suffering from chronic disease and mental disorders).

Exploring the Metaverse from the consumer perspective: insight from a systematic literature review.

MARCO FERRETTI¹ MARIA ANTONELLA FERRI² GIUSEPPE LA RAGIONE³ MARIA PALAZZO⁴
FRANCESCO PAROLA⁵ MARCELLO RISITANO⁶

Abstract

The digital transformation has catalyzed the emergence of the metaverse, transitioning from a speculative idea to a vibrant digital ecosystem that merges digital and physical worlds. This research delves into the metaverse's scholarly landscape from a consumer perspective, utilizing a systematic literature review and the PRISMA Protocol to sift through academic contributions. From an initial dataset of 323 papers, 38 articles were rigorously chosen, revealing an uptick in metaverse-focused studies, with an emphasis on consumers. The analysis identified a preference for qualitative research methods and highlighted key journals as prominent publication venues. With a co-occurrence analysis, it has been possible to unearth interconnected research themes, emphasizing the metaverse's potential to transform consumer interactions and experiences. This work sheds light on the implications of digital technologies for developing new consumption models and proposes future research directions and practical applications across various industries.

Key words: *metaverse; marketing; consumer behavior; systematic literature review (SLR).*

Framing of the research. *The emergence of digitalization is reshaping our world, leading people to spend significant time on digital platforms (e.g., social media, branded apps, metaverse). The enthusiasm of consumers to engage in value co-creation processes and utilize tools that make them feel part of something, such as the metaverse, is noteworthy. The metaverse, a phrase initially introduced by Stephenson (1992), has transformed from a fictional idea into a flourishing digital ecosystem. It presents a series of virtual environments where users can effortlessly transition between digital and physical worlds (Zhao et al., 2022). This digital realm enables users to engage socially through digital avatars, supporting the creation of value and shared experiences. The metaverse integrates mixed reality (MR) technology, ambient intelligence, and progress in information and communication technologies (ICTs), thus acting as a connector between the digital and physical worlds (Gursoy et al., 2022; Buhalis et al., 2023).*

The integration of virtual economies within the metaverse highlights a pivotal shift in consumer engagement and economic transactions. The adoption of cryptocurrencies and NFTs within these environments not only facilitates a novel economic model but also reshapes consumer perception of value and ownership (Ferdig et al., 2022). This paradigm shift prompts a reevaluation of traditional marketing strategies and consumer engagement practices in the context of virtual commerce (Dwivedi et al., 2022).

Exploring the metaverse is vital for its capacity to alter the way consumers interact, work, socialize, and perceive the world. Functioning as a complementary virtual reality, the metaverse delivers immersive experiences unbound by the physical world's constraints (Yoo et al., 2023). It facilitates the discovery of virtual service businesses, interactions with virtual aspects of products and services, and participation in immersive experiences that enhance users' comprehension of offerings (Flavián et al., 2019). The metaverse goes beyond single products or platforms, encompassing a collection of interconnected virtual worlds that act as continuous spaces for information exchange and participation (Gursoy et al., 2022; Visconti, 2022).

The social dynamics within the metaverse, including community building and social interactions, play a crucial role in shaping consumer behavior. These virtual communities offer a new avenue for marketing professionals to foster brand relationships and consumer engagement through innovative approaches that leverage the unique social fabric of the metaverse (Dwivedi et al., 2022; Barrera and Shah, 2023).

Investigating the metaverse is imperative for grasping its influence on various areas, including social interactions, commerce, education, and entertainment. Lately, researchers have turned their attention to aspects of the metaverse. For example, Narin (2021) performed a content analysis of metaverse literature, identifying key themes such as virtual worlds, augmented reality, and the social and economic implications of these digital environments. Likewise, Kim (2021) explored the metaverse's ability to boost interactive advertising, highlighting crucial issues related to privacy, ethics, and the assessment of goods and services within these virtual settings.

The significance of the metaverse is also highlighted by its capability to enable immersive interactions that reduce the perceived risks associated with service offerings. Utilizing virtual reality (VR), augmented reality (AR), and mixed reality (MR) technologies, the metaverse offers multisensory experiences that amplify individuals' engagement and satisfaction (Koochang et al., 2023). This immersive setting backs social and economic activities and brings about changes that redefine consumer behavior and value co-creation (Buhalis et al., 2019). As this digital arena progresses, research will be essential in guiding its development, ensuring the metaverse continues to be an inclusive, engaging, and worthwhile part of our digital future (Allam et al., 2022; Wang et al., 2022). From these considerations, the purpose of this paper is to understand the state of the art of the literature regarding the metaverse from a consumer perspective. Based on previous statements, it is vital to define the following research questions to guide our work:

RQ1: What are the main bibliometric variables, research trends and recurrent thematic areas in the use of metaverse from a consumer perspective?

RQ2: What are the knowledge clusters in the intellectual structure in this research area?

Purpose of the paper. The primary purpose of this study is to shed light on the metaverse from a consumer's perspective, marking a significant step towards understanding its multifaceted impact on consumer behavior and interactions within digital environments. By conducting a systematic review of existing literature, this work aims to dissect and analyze the prevailing research trends, themes, and conceptual clusters that have emerged around the consumer experience in the metaverse. Through this analysis, the study seeks to identify gaps in the current body of research, offering a foundation for future investigations to build upon. Additionally, it endeavors to provide valuable insights for both academics and practitioners by illustrating how the metaverse influences consumer engagement, value co-creation, and the overall consumer journey in digital realms. This study ultimately strives to contribute to the scholarly discourse on digital consumer behavior, paving the way for innovative research directions and practical applications in the evolving digital landscape.

Methodology. The study adopts a structured approach to examine academic works, utilizing a multi-step procedure known as the Systematic Literature Review (SLR) methodology. Chaudhary et al. (2021) highlight the SLR's benefits, including the precise selection of research that matches the inquiry question and contributes theoretical insights and frameworks that spur further investigation. The research employs the PRISMA Protocol, as outlined by Moher et al. (2015), to ensure a standardized selection methodology. Conference papers, books, book chapters, and PhD dissertations are excluded due to their minimal impact on academic literature. Following this, a content analysis is conducted on academic articles to extract key bibliographic information from studies focusing on metaverse and consumer. The analysis utilizes Microsoft Excel and VOSviewer Software for further examination. Initially, a bibliometric analysis is undertaken to investigate the research topic, identifying significant journal contributions and categorizing papers by their types and methodologies. Then, trends and thematic areas are explored through a co-occurrence analysis of keywords, providing insights into the evolving research landscape in this field (Tranfield et al., 2003). The PRISMA approach's initial step identifies the dataset and defines the research scope and focus, selecting the Scopus database for its extensive coverage and widespread use in research for its comprehensive selection of scientific journals, using as specific keywords "metaverse and consumer". These keywords have been searched within paper titles, abstracts, or keywords. This process resulted in a preliminary database of 323 records spanning from 2008 to February 2024. After refining through specific exclusion criteria: Ex1, non-article documents; Ex2, documents not in the business, management, or accounting fields; Ex3, non-English documents; Ex4, documents not published in peer-reviewed international journals, the database was narrowed down to 68 articles. The final phases of the PRISMA protocol involve setting eligibility criteria and selecting papers for the final sample after thoroughly reviewing all full-text articles. This led to the exclusion of 30 articles and the compilation of a sample of 38 bibliographic records. All bibliometric information from the final sample is exported to Microsoft Excel, with Scopus facilitating the extraction of essential data such as titles, abstracts, keywords, author names, publication years, citation counts, and journal names. This dataset is then enhanced with additional information relevant to the research objectives, particularly concerning the approach of the analyzed sample.

Results. The analysis shows a growing trend of publications exploring the metaverse from a consumer perspective. The distribution across years reveals a noticeable upward trajectory in the number of studies conducted. This trend underlines the escalating interest in this particular field especially in the last two years. In relation to research focus, 11 studies adopt a quantitative approach, 16 follow a qualitative methodology, 2 encompass a combination of both quantitative and qualitative methods, and 9 embrace a systematic literature review (Table 1).

Table 1. Paper type

Category	n	Percentage
Qualitative	16	42,10
Quantitative	11	28,94
Systematic literature review	9	23,68
Mixed methods	2	5,26

The preeminent outlet for distributing metaverse research is the *Journal of Consumer Psychology*, which encompasses three publications of 38 of the studies within our sample. Other journals that study this topic can be found in Table 2.

Table 2. Top 10 most relevant contributions

Journal	n	Percentage
Journal of Consumer Psychology	3	7,89
International Journal of Consumer Studies	2	5,26
International Journal of Contemporary Hospitality Management	2	5,26
Journal of Business Research	2	5,26
Journal of Retailing and Consumer Services	2	5,26
Psychology and Marketing	2	5,26
Tourism Review	2	5,26
AMS Review	1	2,63
Asia Pacific Journal of Marketing and Logistics	1	2,63
Business Horizons	1	2,63

Utilizing VOSviewer software (Van Eck et al., 2010; Biggi and Giuliani, 2020; Secinaro et al., 2022), we conducted a co-occurrence analysis of keywords. This method, grounded in bibliometrics, was developed in the Java programming language. It empowers to chart networks among keywords, resulting in clusters that highlight primary research domains. Through co-occurrence analysis, the paper pinpoints instances where chosen keywords appear together in articles, signifying their interconnectedness. VOSviewer employs a natural language processing algorithm to gauge keyword associations and form clusters, color-coding them for differentiation (Van Eck et al., 2010). The resultant visual representation showcases “bubbles” their sizes reflective of keyword frequency within selected publications (Van Eck and Waltman, 2010). The findings enable us to distinguish and interconnect two discrete clusters, each comprising a collection of keywords exhibiting co-occurrence associations. A keyword is allocated to a sole cluster exclusively.

The bibliographic coupling consists of two clusters (Figure 1), encompassing 9 primary items and interconnected by 25 links. The cumulative strength of these links amounts to 57. In particular:

Cluster 1 (Metaverse and tools) comprises five items: augmented reality, blockchain, hospitality, metaverse and virtual reality.

Cluster 2 (Metaverse to engage consumers) comprises four items: consumer behavior, engagement, marketing and metaverse.

Figure 1. Co-occurrence analysis (VOSviewer)

Source: Our elaboration with VOSviewer.

The identification of clusters allows the authors to propose preliminary future research directions to expand the academic contribution on the topic. Starting from Cluster 1, the authors suggest investigating augmented reality (AR) in enhancing online shopping, blockchain's role in secure digital ownership systems, the potential of virtual hospitality experiences, architectural design principles of metaverse environments, and the educational potential of virtual reality (VR). For Cluster 2, proposed directions include examining how consumer purchasing decisions are influenced in virtual environments, the effectiveness of gamification strategies, the psychological effects of extended reality, and targeted advertising strategies assessing personalization versus privacy concerns.

Research limitations. This study has several limitations that warrant attention in future investigations. Given that the concept of the Metaverse is relatively new and continually evolving, the paper highlights that there is a scarcity of peer-reviewed literature specifically focused on the customers' point of view. This limitation affects the comprehensiveness of the SLR and requires researchers to include a broader range of sources in future studies. Initially, the systematic literature review was confined to the SCOPUS database. Subsequent research could broaden its scope by incorporating additional databases such as EBSCO, Web of Science, and Google Scholar. Moreover, the sampling strategy was restricted to the realms of business, management, and accounting. Expanding this to include disciplines like economics, psychology, and sociology could enrich the research's breadth and depth, providing a more holistic understanding of consumer behavior in the Metaverse. Besides, the possibility exists that certain pertinent studies were overlooked, either due to an incomplete set of keywords or the exclusion of relevant documents during the selection phase. Furthermore, the inclusion of studies predominantly from peer-reviewed journals may overlook valuable insights from industry reports, white papers, and conference proceedings that could provide practical applications and emerging trends not yet reflected in academic literature. In addition, the paper demonstrates that the Metaverse is a complex and multifaceted concept, and different researchers and practitioners define it in various ways. This heterogeneity in definitions poses challenges during the selection and categorization of relevant studies focused on customers, leading to inconsistencies in the review process. Furthermore, the Metaverse is undergoing rapid development, with new technologies, platforms, and applications, available for customers, emerging frequently. As a result, the literature available at the time of the review can quickly become outdated, making it challenging to provide a comprehensive overview of the current state of research in the field. Finally, the Metaverse intersects with various disciplines, including computer science, sociology, psychology, economics, and more. Conducting an SLR that adequately captures all relevant literature from these diverse fields and that focusses mainly on consumers' viewpoint requires expertise in multiple domains and may present challenges in terms of search strategy, study selection criteria, and synthesis of findings. Future studies, that address these limitations, require careful consideration of search strategies, inclusion criteria, and synthesis methods, as well as ongoing updates to ensure the relevance and currency of the review findings in the rapidly evolving field of the metaverse. Actually a future research agenda may focus on: (i) Conducting a SLR on the emerging technologies and platforms in the Metaverse. Given the rapidly evolving nature of the Metaverse, focusing on emerging technologies and platforms can offer novel insights. Research can explore how advancements in augmented reality (AR), virtual reality (VR), blockchain, or artificial intelligence (AI) are shaping customer experiences in the Metaverse. (ii) Focusing on the investigation of different cultural and ethical implications of customer interactions within the Metaverse. This could include issues such as privacy concerns, digital identity, cultural representation, and accessibility. (iii) Implementing a longitudinal Analysis. Instead of just providing a snapshot of current literature, it can be conducted a longitudinal analysis to track changes in customer perceptions and behaviors over time towards the Metaverse. This can help identify trends and patterns that might not be apparent in a static review.

Theoretical and managerial implications. This research provides both theoretical and managerial insights, bolstering the consistency and scholarly framework of existing literature, which will act as a foundational base for future investigations in this domain. Moreover, it introduces a unified perspective to research themes that have previously seemed disparate, by proposing a singular analytical approach. This unified perspective not only enhances the coherence of research within this field but also opens new avenues for comprehensive analysis, facilitating a deeper understanding of the subject matter for both academics and practitioners. To the best of the authors' knowledge, this is the first SLR that studies the Metaverse and its impact on consumers. The research findings provide theoretical insights to evaluate the relevance of the digital technologies related to the Metaverse in creating of new consumption models - not confined to the physical world's limitations – to define “hybrid customer experience” through a multi-sensory involvement of the consumer before the purchase phase, during the purchase and/or after the purchase. Secondly, it allows for an understanding of the current literature's themes on the topic, paving the way for future research and evaluating the academic challenges in terms of adoption of new research methods (e.g. Neuromarketing Techniques) and exploring of specific business contexts (e.g. Tourism, Retail, Gaming, etc.). A systematic literature review on the Metaverse from the customer point of view can have several important managerial implications for businesses looking to capitalize on this emerging trend. First of all, focusing on the analysis of clusters 1 and 2, the SLR provides original insights into what customers may expect from the Metaverse experience. This understanding can guide practitioners in developing products and services that align with these expectations, thereby enhancing customer engagement, satisfaction and loyalty. Besides, by analyzing the existing literature, managers can identify the key features and preferences that customers value in the Metaverse. This information can inform product development and innovation strategies to create offerings that resonate with customers and differentiate a company from competitors. In fact, understanding how customers ‘navigate’ and interact within the Metaverse can help businesses map out real customer journeys and optimize touchpoints to improve engagement and conversion rates. This insight can also aid in refining marketing strategies to effectively target and reach customers within the Metaverse.

Moreover, the SLR reveal to some extent initial insights into the importance of personalization and customization in the Metaverse experience. Managers can leverage this knowledge to tailor offerings and experiences to individual customer preferences, enhancing relevance and satisfaction.

In addition, focusing on the analysis of cluster 2, it is clear that customer trust and security are crucial in any digital environment, including the Metaverse. Insights from the SLR can inform managers about the factors that influence customer trust and perceptions of security within the Metaverse. This understanding can guide the implementation of robust security measures and strategies to build trust with customers.

Finally, by identifying gaps or areas of improvement in the current Metaverse offerings, managers can develop value-added services that address unmet customer needs or pain points. This could involve integrating additional features, enhancing user interfaces, or providing superior customer support within the Metaverse environment. In the light of these considerations, managers can even decide to use this foresight to anticipate customer needs and preferences, enabling them to stay ahead of the curve and adapt their strategies accordingly. Overall, for managers understanding the benefits of Metaverse serves as a powerful competitive tool to achieve consumer engagement and involve the customers in the value co-creation of experiences, maximizing consumer-brand relationships in the long term.

Originality of the paper. This section elaborates on the originality of the work, positioning it as one of the first to examine the metaverse from a consumer perspective. While other systematic literature reviews exist in the field, none, to the authors' best knowledge, specifically focus on the consumer aspect. By analyzing existing papers in the literature, this study has been able to identify previously discussed topics, thereby outlining how future research can be conducted to benefit both academics and managers. This approach not only underscores the uniqueness of the work but also highlights its contribution to expanding the understanding of the metaverse's impact on consumer behavior. Moreover, considering integrating insights from various disciplines such as business, management, and accounting provide a holistic understanding of customers' viewpoint in the Metaverse. This cross-disciplinary approach offers unique insights that needs to be better explored in existing literature reviews. Finally, starting from the analysis of the four items included in cluster 2 (consumer behavior, engagement, extended reality, and marketing) helped the researchers to conduct an initial comparative analysis of how customer experiences in the Metaverse differ from those in the physical world or other virtual environments. Highlighting these differences shed light on the unique challenges and opportunities of the Metaverse that have to be better explained in theory and practice.

Fifty Shades of Black Friday

FRANCESCA NEGRI¹ ALESSANDRO IUFFMANN GHEZZI²

Abstract

Promotional events, such as Black Friday and Singles' Day, have become prominent fixtures in the calendar worldwide, offering consumers significant discounts and driving immense sales volumes. These events originated in different parts of the world but have gained global recognition due to the proliferation of e-commerce and international trade. They're characterized by retailers offering substantial discounts, both online and in-store, prompting a frenzy of consumer activity. They have also been present in the Italian market, and it might be worth researching today about the effectiveness of these promotions, between different media and channels, also evaluating the implications in terms of sustainability of the customer journey. Through two sessions of three Focus Groups each, this contribution seeks to bring out the point of view of Gen Z, with the dual purpose of integrating the stream of literature on Big Discount Days (BDDs) and providing some managerial implications for the companies.

Key words: *Black Friday; Big Discount Days (BDDs); Gen Z; Focus Groups; sustainability; unplanned purchase*

Framing of the research. *The big discount days were first implemented in the USA under the name "Black Friday", the first Friday after the Thanksgiving: some stores' sales continue to Monday (the so called "Cyber Monday") or for a week ("Cyber Week"). From the United States this shopping tradition has recently spread to Europe, while in Eastern countries Singles Day, November 11th, is very popular. What do these days have in common? Which centralize a large part of people's shopping activities and excitement, across different channels and generations. Today Black Friday and Singles' Day are monumental promotional events that continue to shape consumer behavior and drive substantial economic activity on both a national and global scale. What is influenced is not only the purchasing behavior of the consumer, but also the management of promotions by brands and distributors, who chase, imitate and/or contest these days of deep discounts at a global level. Anything can be done except ignoring them.*

Parallel to the cross-countries diffusion, new traits and contaminations have appeared which are modifying its essence (Thomas and Peters, 2011): consumers are shopping earlier, moving online, taking advantage of delivery and curbside pickup, and expecting retailers to provide a safe, socially distanced shopping experience (Peters and Thomas, 2022). This shift represents a push to investigate the phenomenon more deeply. Therefore, the Black Friday and Single Days event have been previously examined trying to understand consumer intentions (Swilley and Goldsmith, 2012; Lennon et al., 2018), within the context of literature on marketing promotions (Khodabakhsh et al., 2018), in terms of communicational ritual (Bell et al., 2014), or focusing on specific Country (Spain in the case of Giroto et al., 2023; Botswana in Jaiyeoba et al., 2020; Greece in Tsiotsou, 2017; USA in Harrison et al., 2010 and Kwon and Brinthaup, 2015). Moreover, literature pointed out both positive and negative emotions on Black Friday, where positive emotions were connected to excitement and happiness, whereas negative emotions involved anger, anxiety, belligerence, disgust, distress, irritability, sadness, and tension (Taylor et al., 2011; O'Sullivan, 2016; Tzeng et al., 2020). Yet, some aspects still remain unanalyzed by the literature. In particular, to the best of our knowledge: the relationship between planned and unplanned purchases over these days, the cross-channel analysis trying to investigate the vocation of online and offline channels in the different stages of shopping behaviour and the theme of economic and environmental sustainability. Topics that we believe are particularly relevant to Gen Z.

Purpose of the paper. *Thus, the research questions were as follows:*

RQ1) How effective is the Big Discount Days (BDDs) promotion today in determining planned and/or unplanned purchases?

RQ2) Is this promotional effectiveness greater online or offline, or is it the same? Are the two channels competing with each other? How does the experience change between online and offline? What role do these channels have in the phases of the customer journey?

RQ3) How much will the Gen Z's greater sensitivity towards environmental and economic sustainability impact the effectiveness of these mass purchasing days?

² Catholic University of Milan
e-mail: alessandro.iuffmannghezzi@unicatt.it

Methodology. To investigate these aspects, six Focus Groups (Lederman, 1990; Creswell and Creswell, 2018) were carried out, with a first convocation two weeks before Black Friday 2024 and a second convocation ten days after Black Friday 2024, to collect expectations, sentiment and planning (first convocation) and measure actual purchasing behavior, feelings and level of satisfaction *ex post* (second convocation) regarding the shopping journey just experienced. The choice of a double call for the three groups (for a total of six Focus Groups) was aimed to investigate the intentions, perceptions and also the effective behaviors, since our aim (RQ1) was to investigate the effectiveness of the promotional lever of the Big Sales Day in determining planned purchases and/or unplanned. The topic addressed by RQ2 and RQ3 instead emerged both in the first convening session and in the second.

In detail, the participants all belong to Gen Z. The six Focus Groups were run online (via Microsoft Teams) and involved 24 people (8 people per group: the same group was called before and after Black Friday). The participants were selected using Authors personal networks (opportunistic sampling) according to the following criteria: 1) to have shopping experience both online and offline and 2) have known what Black Friday was for at least 2 years. In collecting the availability to participate in the focus group studies, a small monetary incentive (10 euros) has been offered for participation (Van Laer et al. 2012).

The moderators adopted a soft-empathetic style of conduction making sure that the group dynamics facilitated the emergence of reliable information: through moderation, was ensured 1) the discussion of all points highlighted by previous literature, and 2) a friendly and neutral environment, ensuring that everyone could express their thoughts trying to soften the double social desirability bias. Participants' privacy was ensured at the beginning of the meeting, specifying that any information would have been traced anonymously and in aggregate form. Furthermore, the authorization to record the conversations has been requested and obtained. In order to conduct ethical research, participants were also assured full access to the research outputs once published.

The focus group protocol was designed on literature review and included the following key questions: prevalence of which feeling (impatient waiting and/or overwhelmed by choice/information overload), and how this feeling has changed or not year after year; touchpoints involved to collect information; planning and budgeting, including the impact of planning on "in view of" purchasing stops; purpose of any purchases (for yourself, in view of Christmas, ...); role and function of online and offline sales channels; perception and propensity for risk/innovation (purchases of already known products vs. new products and markets); subscription to newsletters/offers that could encourage loyalty even *ex post*; payment systems (deferred or not); aspects of economic and environmental sustainability considered; actual experience (planned/unplanned purchases ratio, budget used, overall sentiment; Black Friday-Cyber Monday ratio); functional aspects (delivery, couriers); weight and role of any returns. Alongside these planned points, other results emerged which were not foreseen in the schedule, as typically happens in qualitative research, and which will be treated in the next Results section.

Even if this is a small-scale study based on three focus groups, the results can be considered reliable, because the differences that emerge from the three Focus Groups are few and small, and we believe that the exhaustiveness criterion has been reached.

Results. From the analysis of the considerations that emerged during the research phase, it was possible to deduce the new meaning that these days have for the specific generation, the relationship between planned and unplanned purchases across different media and channels, and how these days are dis-connected with the theme of conscious shopping behaviour and of sustainability.

RQ1 discussion: From the discussion of the Focus Groups, it emerges without doubts that the majority of purchases during the typical promotional days of Black Friday are planned. Even the choice to join or not is planned: the participants resolutely told us how they would behave, joining or not, and there were no *ex-post* changes. This also applies to the choice of channels: those who had announced that they would give preference to online predominantly used online, and vice versa. Those who were afraid of making unplanned purchases didn't make them anyway. During the discussion we tried to understand whether budgetary constraints determined the preponderance of the planned part, but this reading was not confirmed. Simply, we were told, Black Friday offers are not perceived as that unmissable, now having many entire periods of offers beyond the seasonal sales. A certain distrust towards Black Friday also emerged, cross-channel: the fear of finding old clothes and objects, the feeling of being looked at with judgment in physical stores by sales assistants, the feeling of having a lower level of service (for example, the perception that it is easier for couriers to lose a package or delay delivery due to the rush) leads some people to give up from the start. Those who had a shopping list, perhaps already containing Christmas presents, were satisfied with having completed the task. In fact, strong planning often leads to eroding sales for the Christmas period, thanks also to the growing number of days of accepted returns (up to three months, even covering Valentine's Day). In the shopping lists there are, and it is almost obvious considering what previously discussed, above all already known products and brands: this moment does not currently represent an opportunity to get to know new companies. Gen Z appeared to be very informed and skilled, not easily influenced by emails and promotional messages (which were instead considered rather excessive): among the most used tools for planning and getting information there are certainly wishlists, Telegram channels of content creators, YouTubers, broadcast channels. For physical stores, also windows are very important to support communication.

RQ2 discussion: Promotional effectiveness does not seem to be perceived as different between online and offline channels: it is simply easier to collect information online, because price communication is more monitorable and, we were told, applications capable of monitoring dynamics pricing are often used, also for activating alerts and memos. Offline, many people perceive it as difficult to monitor price developments. The two channels do not compete directly with each other, since it is not the degree of promotional offer that determines the choice for one or the other: those who

choose online do so because they generally prefer to buy online, they have a greater level of confidence with online environment and appreciate the online advantages. Those who select offline channels during these periods do so because they have a clear preference for the physical channel, contact with the sales staff and the pleasure of in-store shopping. In some cases, these channels intersect during the customer journey: for example, for those who buy online it is very appreciated to be able to make a return offline, just as for those who buy offline it is very useful to receive information online, such as through the WhatsApp Business channels run by small independent shops that perhaps don't have a website. Finally, both online and offline, no clear distinction emerged between Black Friday and Cyber Monday, which were instead perceived as absolutely overlapping and indistinguishable events.

RQ3 discussion: Probably because it was a strong planning of the purchasers that emerged in parallel with a growing decrease in the promotional effectiveness of Black Friday, among the people involved in the study there was no strong concern about the issue of economic or environmental sustainability specifically connected to Black Friday. No one, for example, claimed that they would buy more than necessary thanks to the possibility of paying in installments. The element that emerged most is undoubtedly linked to the environmental sustainability of online shopping deliveries. Finally, very few were aware that for ethical reasons some companies had opted out of joining Black Friday promotions. Montura was one of the few to be cited.

Research limitations. The study is based on a qualitative research method, and this implies the typical limitations of qualitative research, including the reduced generalizability of the results. However, this is not a preliminary study: the research hypotheses determine the choice of the Focus Groups, in order to investigate the deeper reasons and the level of awareness of consumers thanks to the stimulation of conversation between peers. In order to increase its robustness and value, we could proceed by expanding the number of countries involved and/or apply the RQs to other generations, maybe more involved in BDDs.

Managerial implications. Finally, Managerial Implications for Brands were discussed as the essence of Black Friday & co has changed: this section included strategies producers and retailers can use to engage shoppers across different channel, without losing sight of the new value sets of Gen Z.

The main managerial implications that emerge from the Focus Group discussion is an invitation to Brands not to focus only on the promo, but to consider the Customer Experience in its entirety: people, especially in physical stores, have become wary of certain offers, and they often feel like “second class customers” (paradoxically, customers are surprised when they aren't treated badly in stores on Black Friday!). It is necessary to improve the customer's overall CX, to transform this moment into an opportunity to create a lasting relationship with the customer and not just a single sale. The low level of satisfaction with online and offline experiences seems to force Brands to better prepare for the wave of requests linked to Black Friday and Cyber Monday, strengthening the stability/reach of sites and apps and investing in more staff in physical stores with advance. If online brands/retailers seemed to have learned to manage, at least in part, the greater turnout, this is not the case for physical stores, where queues outside and very crowded shops are often reported: physical retailers, perhaps also looking at online retailers, could plan systems for managing queues and store attendance, through visit planning systems or events that entertain people while they are waiting. As for online retailers, greater planning in terms of production capacity also translates into greater investment in logistics strength, to ensure punctual and well-managed deliveries. In this, big players like Amazon set very high standards. However, some of the participants highlighted that in this time of the year, a small drop in the level of service is considered almost physiological, and therefore acceptable.

The second aspect that must be considered is the weakening of the promotional leverage, which risks triggering a vicious circle: the offers always start earlier (from Prime Day at the beginning of October, for example), and this means that the only distinction for Big Promotional Days such as Black Friday is the depth of the discount, which must be increasingly deeper, leading many times to a loss of margins. Literature has always underlined that promotions must be short and deep to be effective: today companies are adopting the opposite behavior. It also emerges from the Focus Groups that Gen Z are very attentive to monitoring promotions, thanks to a variety of channels such as Telegram and YouTube, and is therefore absolutely capable not only of recognizing the evolving depth of the discount, also for long periods (months), but of noticing situations (they seem growing) in which brands and retailers cheat customers by offering discounts on Black Friday that are lower than other days. This promotional management therefore determines not only a lower effectiveness of the promotional lever, but also a potential fracture/loss of trust between the Brand and the customer, who feels “ripped off”. In rethinking greater promotional effectiveness, with clearer and time-limited discounts, Brands should also communicate their policies, to invest in building trust. For example, those brands that specify in advance the arrival of an important promotion are extremely appreciated: in that way customers will have the opportunity to plan the purchase and will not find themselves in the unpleasant sensation that often happens when making a purchase and receiving a promo within a few hours. Furthermore, the policy adopted by some brands of incremental discounts as Black Friday approaches seems to put some customers in crisis, who are never sure when the right time to buy is, fearing at the same time that the product will sell out. Once again, a demand for more transparent promotion communication clearly emerges. For some, the process of gathering information is very burdensome, and leads to significant levels of dissatisfaction and fatigue, even to the point of giving up.

The fact that in Italy BDDs typical of other countries are also recently celebrated, such as Single Days, makes the occasions very little distinctive: there are many opportunities to create more distinctive way to manage promotions.

Currently, during Black Friday and others BDDs is perceived a dangerous overlapping level of offers across different brands and channels, which make them all perfectly substitutable.

Since from the Focus Groups emerges, in confirmation of the reading, an absolutely omnichannel customer journey in every phase, which involves even non-traditional touchpoints for the collection of information (role of influencer broadcast channels, for example), it is crucial for Brands to ensure a fluid and seamless experience between sales and communication channels, starting to cover even the less obvious channels. On the other hand, some channels seem to be much less used to communicate Black Friday offers, such as TV or print media, where there is no perceived crowding.

In closing the Managerial Implications, it is worth noting that among the people involved in the study there was very little awareness of the companies that did not join Black Friday, for the most disparate reasons (economic or ethical, mainly). The advice that emerges from this is to invest in communicating this choice, in order to create awareness and differentiate yourself. However, this concerns sectors where participation in Black Friday is expected, such as clothing and consumer electronics, for example: instead, sectors have emerged, such as art or education, in which participation is not expected.

Originality of the paper. We believe the first element of originality derives from the continuous evolution of the phenomenon under study, where the promotional lever effectiveness has been shown to be changing year after year, as are consumers: increasingly skilled, prepared, bored and with greater attention to the economic and environmental sustainability of their purchases. The topic of promotional effectiveness must be studied in a constantly updated manner precisely because of this changeability, linked to market and demand factors. Moreover, to the best of our knowledge, this is the first contribution that tries to contextualize the role of Big Discount Days (BDDs) promotion in determining planned versus unplanned purchases, also using an intertype competition (online and offline, across different sectors) lens. Further elements of originality are the focus on Gen Z and the Italian market.

Entrepreneurial Ecosystem and Proximity: a framework for Social Ecosystem Development

RICKY CELENTA¹ VALENTINA CUCINO² ROSANGELA FEOLA³ CHIARA CRUDELE⁴

Abstract

In recent decades, studies on entrepreneurship have evolved from an analysis focused on the individual to a broader perspective centered on the community, introducing the concept of the entrepreneurial ecosystem. This concept represents an interconnected network of actors influencing the creation and trajectory of businesses in a geographical region. Over the years, literature has explored various dimensions of these ecosystems, including the involved actors, physical infrastructures, and entrepreneurial culture. However, recent research has highlighted the need to analyze entrepreneurial ecosystems at various levels of proximity. This study proposes to examine the movement of BCorps as a case study to understand how different forms of proximity influence the development of social entrepreneurial ecosystems. Through a qualitative methodology, the aim is to provide a new perspective on the interaction between social ecosystems and entrepreneurship, thereby contributing to the understanding and development of social entrepreneurial ecosystems.

Key words: *Entrepreneurial Ecosystem; Proximity; Sustainable; BCorp; Benefit Corporation; Case study*

Framing of the research. *Towards the end of the 1980s, there was a shift in entrepreneurship studies, moving from an analysis focused on the individual and their personality to a broader perspective centered around the community (Stam et al., 2015). During this period, the conceptual foundations of entrepreneurial ecosystems emerged, taking into account the influence of social, cultural, and economic forces in the entrepreneurial process (Aldrich, 1990). The first definition of an entrepreneurial ecosystem is attributed to Cohen (2006): “Entrepreneurial ecosystems represent a diverse set of inter-dependent actors within a geographic region that influence the formation and eventual trajectory of the entire group of actors and potentially the economy as a whole...Entrepreneurial ecosystems evolve through a set of interdependent components which interact to generate new venture creation over time.”*

In the initial literature, the ecosystem was explored through three main conceptual frameworks combining different disciplines: economics, geography, and sociology (Feld, 2012). Furthermore, it was highlighted that the entrepreneurial ecosystem comprises three dimensions: the actors involved and their interactions, physical infrastructures, and entrepreneurial culture (Cohen, 2006). Building on these premises, Spigel (2017) proposed three categories of tangible and intangible attributes describing the configuration of an entrepreneurial ecosystem: cultural, social, and material. In recent years, the concept of an entrepreneurial ecosystem has attracted considerable attention (Stam, 2015; Stam & Spigel, 2017; Theodoraki et al., 2018; 2022), and it has been understood that the entrepreneurial ecosystem, as a highly complex construct, needs to be studied at various levels of analysis (Theodoraki and Messeghem, 2017). Indeed, as the literature progresses, the geographical dimension has increasingly expanded its boundaries (Stam and van de Ven, 2019; Theodoraki and Catanzaro, 2022), and the need to analyze entrepreneurial ecosystems through a multilevel approach has become more apparent (Theodoraki and Messeghem, 2017). Indeed, although geographic proximity facilitates interactive learning, it is neither a necessary nor a sufficient condition for learning to take place; in this sense, geographic proximity probably only reinforces other dimensions of proximity (Boschma, 2005). In fact, as highlighted by Boschma (2005), geographic proximity is just one of the proximities underlying the development of an entrepreneurial ecosystem: cognitive, organizational, social, institutional, and geographical proximity. Cognitive Proximity is defined as the extent to which actors share a similar knowledge base and expertise, enabling them to learn from each other. Organizational proximity is defined as the extent to which relationships are shared within or between organizations. It involves the degree of autonomy and control that can be exercised in organizational arrangements. As highlighted, too much organizational proximity can lead to a lack of flexibility and innovation, while too little can lead to a lack of control and increased opportunism. Loosely coupled systems are suggested as a balance, providing both control and flexibility for interactive

learning and innovation. Social proximity includes the depth of interpersonal connections among agents at a microscopic level, based on trust established through various personal ties such as friendships, family ties, and shared experiences. It is crucial to understand that these connections are not solely based on formal agreements but are rather rooted in mutual understanding and reliability; therefore, in social proximity, the foundation lies in trust-based relationships. A third dimension of proximity identified by Boschma (2005) is Institutional proximity, which is instead associated with the macro-level institutional framework. Therefore, new studies are needed to analyze the role of multilevel proximities in the entrepreneurial ecosystem formation process. As highlighted in the literature (Acs et al., 2014), entrepreneurs are central actors in the EE building process. However, the success of EE performances relies on interactions among three components: individuals, organizations, and institutions (Alvedalen & Boschma, 2017; Theodoraki et al., 2022). Following this approach, the individual is defined in a broader sense; indeed, as argued by some scholars (Qian et al., 2013), not all individuals involved in the EE are connected to the firm and thus to market opportunity, but they are involved in the entrepreneurial ecosystem because they have different roles and objectives. In this sense, it is interesting to study the motivations of different types of people, organizations, and institutions deciding to become part of the EE, in order to identify the lowest common denominator. Careful work in this direction has been carried out by Audretsch and Belitski (2017), who described the relationships within the six domains of the ecosystem framework conditions. Important for the development of the literature is the integrative model of entrepreneurial ecosystems proposed by (Stam & Van de Ven, 2021) consisting of ten elements (formal institutions, culture, networks, physical infrastructure, demand, leadership, talent, knowledge, finance, and intermediate services. These elements are mutually interdependent and co-evolve in a territory).

Purpose of the paper. In recent years, there has been a considerable increase in interest in Entrepreneurship Ecosystems (Audretsch and Link, 2019), as policymakers, practitioners, and scholars have recognized their valuable role in supporting the development of economies and societies (Autio et al., 2018; Cloitre et al., 2022). Concurrently, the growing interest in entrepreneurship ecosystems has focused on understanding the role of entrepreneurship in the dynamics of value creation and capture within complex and multilevel economic systems (Acs et al., 2017; Simatupang et al., 2015; Volkmann et al., 2021).

In particular, scholars in entrepreneurship and management have emphasized the importance of interactions among different actors within an entrepreneurship ecosystem in terms of creating value for the territorial context. Despite dynamism being foundational to the definition of an entrepreneurship ecosystem (Cohen, 2006; Audretsch and Belitski, 2016; Acs et al., 2014), current literature appears to adopt a predominantly static framework in analyzing actor relationships, with little attention to ecosystem evolution. This approach, in our view, fails to account for changes and dynamics that may occur within the ecosystem. Indeed, despite the conceptual appeal of network dynamics, empirical analysis of network dynamics in entrepreneurship studies remains scarce (Hoang & Antoncic, 2003; Gustafsson & Autio, 2011), highlighting the need for a more dynamic approach to studying entrepreneurship ecosystems that considers network evolution over time.

The aim of this study is twofold: firstly, we aim to examine the interconnection of various dimensions of proximity (Boschma, 2005) in the development of entrepreneurship ecosystems. By analyzing the relationship between these dimensions, we seek to gain a deeper understanding of how they collectively influence the creation and growth of successful entrepreneurship ecosystems. Many authors underscore various proximities as central elements in ecosystem formation. Specifically, significant attention is given to geographical proximity (Cohen 2006, p. 3; Stam and Spigel 2017, p. 1). However, another central element in ecosystem development, yet to be thoroughly analyzed, is "the sharing of the same goal" (Theodoraki, 2018). The second objective is to analyze the social aim within the theoretical framework of entrepreneurship ecosystems, particularly understanding how different types of proximity impact the development of Social Entrepreneurial Ecosystems. The main goal of the research is not to explain variations in specific outcome variables but to analyze the network creation process by examining the role of proximity in entrepreneurship ecosystem development. While literature extensively highlights proximity as a central element in entrepreneurship ecosystem development, little attention has been given to other types of proximity beyond geographical (Ancona et al., 2023). This article aims to demonstrate how the presence of various types of proximity, along with the diffusion of new communication and network technologies, can support the development of entrepreneurship ecosystems that do not exhibit strong spatial proximity. Simultaneously, with this work, we aim to contribute to the development of research that links entrepreneurship ecosystems with sustainability research in a broad sense (Theodoraki et al., 2018; Cloitre et al., 2022; Theodoraki et al., 2022; Audretsch et al., 2024), not only tied to the environment but also to social sustainability (Audretsch et al., 2019; Volkmann et al., 2021), understood as the ability to generate value for all stakeholders involved in the ecosystem, including community stakeholders. Given the increasing pressure of fundamental social challenges, which include but are not limited to climate change, it is increasingly necessary to investigate the peculiarities of sustainable business creation through the perspective provided by the concept of Social Entrepreneurial Ecosystems. However, despite the importance of the theme, so far only a small number of studies have explicitly focused on issues regarding the social goals of business environments within the conceptual framework of ecosystems (Volkmann et al., 2021). Therefore, starting from the notion of a Social Entrepreneurial Ecosystem (SEE), understood as a concept that relates entrepreneurship ecosystems to sustainability issues and focuses on promoting sustainable entrepreneurship (Volkmann et al., 2021), we have decided to analyze an entrepreneurship ecosystem that aims to adopt a multi-level approach to social entrepreneurship to address global challenges (Welter et al., 2019): the B-Corp movement. The B Corp movement is a global initiative aimed at redefining success in the business world by promoting companies that prioritize social and environmental impact alongside financial profit. B Corps are for-profit companies that choose to undergo a certification

process by the non-profit organization B Lab, which evaluates their overall performance in terms of governance, social and environmental aspects, as well as their responsibility and transparency. To achieve B Corp certification, companies must meet rigorous standards of social and environmental performance, legal accountability, and transparency. These standards include various aspects of business operations, defined as "Impact Areas": Governance, Workers, Community, Environment, and Customers. The B Corp movement aims to encourage businesses to adopt more sustainable and responsible practices, with the ultimate goal of achieving positive outcomes for society and the environment. Through voluntary adherence to these standards and successful certification, B Corps demonstrate their commitment to using business activity as a force for the common good. Since its inception, the B Corp movement has seen significant growth, with thousands of certified B Corps operating in various sectors and regions worldwide. These companies range from small startups to large multinational corporations, united by their shared commitment to balancing profit with a broader purpose and generating a positive impact on the world.

Methodology. In the study of entrepreneurship ecosystems, various methods can be employed (Stangler and Bell-Masterson, 2015). However, according to Spilling (1996), the multitude of actors, their roles, and the different factors of complexity that characterize ecosystems make their study more intricate. Therefore, a qualitative method "seems particularly appropriate for exploratory studies in entrepreneurship research" (Dana and Dana, 2005, p.86). Given the exploratory nature of the research question and objectives, we decided to employ an in-depth qualitative research methodology to develop a theoretical framework. To achieve this goal, we followed the strategy recommended by Glaser and Strauss (2017) to develop a theory based on empirical data. Our research design is based on a single case study since, as widely recognized in the literature, it is a relevant methodology for exploring and understanding complex phenomena still underexposed to the research community (Yin, 2013). The study of a single case was based on the national BCorp ecosystem, chosen as a case study to extract the theoretical framework. In particular, we scrutinize the ecosystem of B Corps within the Italian landscape. The selection of the Italian context is motivated by several factors. Firstly, various studies have highlighted the active engagement of Italian enterprises in collaborative endeavors aimed at both entrepreneurial and social objectives (Cucino et al., 2024; Ferrigno and Cucino, 2021). Secondly, research on the Italian context elucidates how Italian enterprises are proficient in fostering collaborations that yield social innovation within the community (Annesi and Cucino, 2023). Finally, since the first B Corp was certified in Italy in 2013, the Italian movement has grown significantly, reaching 100 companies in 2018 and 240 in 2023, making Italy the second country in the European Union in terms of the number of B Corps (www.bcorporation.eu).

The analysis proceeded in three stages. Initially, we reviewed the literature on entrepreneurial ecosystems and proximity to ascertain any convergence between the core elements of the entrepreneurial ecosystem and the BCorp model. Subsequently, we assessed whether the BCorp movement could be categorized as a sustainable social entrepreneurship ecosystem, necessitating alignment with the ecosystem components delineated in Cohen's (2006) model and congruence with the entrepreneurial ecosystem model formulated by Stam (2015).

In the third phase, currently underway, we are gathering information on Italian BCorps. Specifically, we are collating secondary data on Italian BCorps to examine individual ecosystems. Following this, we will conduct qualitative interviews with select representatives of Italian BCorps. These data will facilitate triangulation in constructing the process of creating the entrepreneurial social ecosystem and delineate the role of proximity in each phase.

Results. The primary aim of this study is to furnish an analytical framework that elucidates the role of various types of proximity in fostering the development of a social entrepreneurship ecosystem. While existing literature predominantly concentrates on geographical proximity, our research brings attention to other forms of proximity, notably institutional proximity, which have been comparatively overlooked. Through an examination of an unconventional entrepreneurial ecosystem, our objective is to illustrate how robust levels of various proximities, particularly institutional ones, facilitate the establishment of ecosystems among actors who may not be physically proximate.

Specifically, our study has delineated a three-phase process in constructing the entrepreneurial ecosystem. In the initial phase, termed "community building," actors with similar skills and knowledge facilitate mutual learning (cognitive proximity). Subsequently, in the "legal recognition" phase, the entrepreneurial ecosystem endeavors to attain legal acknowledgment of the entrepreneurial endeavor (institutional proximity). Moving to the "development" phase, emphasis is placed on internal and inter-organizational relationships (organizational proximity), with companies seeking financial backing to fortify the social entrepreneurial ecosystem. The final phase entails consolidation, characterized by interpersonal connections among agents founded on trust established through personal ties (social proximity).

Furthermore, our research delves into the specific dynamics within each phase, aiming to provide insights into how proximity influences the interactions and collaborations among ecosystem actors. By comprehensively examining the interplay between different forms of proximity and the various phases of ecosystem development, we seek to contribute to a deeper understanding of the mechanisms underpinning the emergence and growth of social entrepreneurship ecosystems.

Research limitations. The analysis is conducted on the Italian BCorp movement, and therefore, the study is conditioned by the specific characteristics of the Italian context. Even though the BCorp movement is international and the companies adhering to it follow uniform criteria, belonging to a country, with all that entails legally, socially, economically, and culturally, significantly shapes the approach of individual actors and thus the ecosystem. It is also for this reason that the decision was made to analyze the BCorp movement at the national level rather than internationally. Despite the efforts made in this study, there are certainly opportunities for further research in the field of entrepreneurship ecosystems and sustainability. It would be interesting to expand the research by including a broader sample of

entrepreneurship ecosystems, both at the national and international levels, to obtain a more comprehensive and comparative view of proximity dynamics. Additionally, it could be useful to examine in more detail the impact of different dimensions of sustainability (environmental, social, and economic) on the entrepreneurship ecosystem and how these dimensions mutually influence the value creation process.

Managerial implications. The research presents intriguing managerial implications for the development of entrepreneurial ecosystems, highlighting several key considerations. One of the main observations concerns understanding the dynamics of "proximity" within ecosystems. In addition to traditional geographical proximity, the importance of other types of proximity, such as institutional and social, is emphasized. This means that managers can focus not only on the physical co-location of companies within ecosystems but also on developing strong institutional relationships and deep social ties among the involved actors.

Furthermore, the importance of promoting social entrepreneurship within ecosystems is clearly evident (Thompson et al., 2018). The research suggests that social and environmental goals can be crucial drivers for ecosystem development, alongside traditional financial objectives. Managers can draw inspiration from the B Corp movement, which emphasizes balancing profit with social and environmental impact, to embed sustainability into their ecosystem strategies (Volkman et al., 2021). Additionally, the study underscores the significance of fostering collaboration and goal-sharing among ecosystem actors. By articulating a clear vision and mission, aligning stakeholders around common objectives, and cultivating a culture of trust and mutual understanding, managers can create an environment conducive to collaborative (Annrsi and Cucino, 2023) and regenerative (Cucino, 2023) innovation within ecosystems. Moreover, the research advocates for adopting a dynamic approach to ecosystem development, considering network evolution over time. Managers should continuously assess and adapt their strategies in response to changing dynamics (Chesbrough, 2020; Cucino et al., 2024), leveraging insights from network analysis to identify emerging opportunities and challenges.

Overall, the findings highlight the multifaceted nature of entrepreneurial ecosystems and the importance of nurturing diverse forms of proximity, collaboration, and sustainability to drive ecosystem development and create lasting value for all stakeholders involved. Managers can leverage these insights to cultivate thriving and resilient ecosystems that contribute to economic growth, social welfare, and environmental sustainability.

Overall, the findings highlight the multifaceted nature of entrepreneurial ecosystems and the importance of cultivating different forms of proximity, collaboration and sustainability to drive ecosystem development and create lasting value for all stakeholders involved. Managers can leverage this information to cultivate thriving, resilient ecosystems that contribute not only to resilient business growth (Cucino et al., 2022; Mason & Brown, 2014); but also to community economic growth, social well-being, and environmental sustainability.

Originality of the paper. In conclusion, this study aims to examine the interconnection of various dimensions of proximity in the development of entrepreneurship ecosystems. Through a comprehensive analysis of the relationships between geographical, institutional, and other forms of proximity, the aim is to better understand how these factors influence the creation and growth of entrepreneurship ecosystems. Additionally, by studying the BCorp movement, the goal is to contribute to the debate on sustainability in entrepreneurship ecosystems and provide a new perspective on the interaction between sustainability and entrepreneurship. To date, few studies have analyzed goal-sharing (Theodoraki, 2018) as a relevant proximity in the development of entrepreneurship ecosystems. Moreover, to our knowledge, there are no studies that have analyzed the BCorp movement through the lens of the Entrepreneurship Ecosystem. Despite the limitations and possible future directions, it is hoped that this work can provide a significant contribution to the understanding and development of sustainable entrepreneurship ecosystems.

Purpose-driven Clusters in the Era of Sustainability

MICHELE SIMONI¹ MARIA CRISTINA PIETRONUDO² EVA PANETTI³

Abstract

Despite the growing body of empirical evidence, theoretical research on the role of industrial clusters in sustainable development remains limited. Existing studies often apply recent cluster literature to interpret real-world cases, providing only partial insights. This paper seeks to fill this gap by addressing the conversation on cluster dynamics to comprehensively understand both their potentialities and limitations in fostering sustainable development. Our paper focuses on the theoretical aspects of clusters within the context of the sustainable economy, representing a novel contribution to the literature. While prior research has primarily examined standard industrial configurations to explore the effects of agglomeration, our study aims to delve deeper into purpose-driven clusters. These clusters exhibit an overarching commitment not limited to industrial and economic interests but extended to preserving and protecting the environment in which they operate. Specifically, we increasingly observe cases of purpose-driven clusters involved in protecting natural resources. By offering a theoretical framework for understanding clusters within the context of sustainability, this research aims to advance scholarly discourse, advancing some theoretical propositions on purpose-driven clusters and suggesting some directions for policy decisions in pursuing a more sustainable future.

Keywords: cluster; purpose; sustainability; natural resources protection

Framing of the research. Sustainable challenges, as well as the diffusion of new and transversal technologies, are changing the industrial configurations of firms. In particular, the increasing sustainable challenges require the involvement of several firms and actors from different economic activities, pushing firms toward new forms of agglomeration to disseminate and implement sustainable development initiatives. These new configurations of actors are coalescing around inspiring aims, more precisely, around a common purpose that enhances their commitment to the environment (e.g., natural ecosystems) and society in which they operate, rather than solely prioritizing the profitability of cluster's actors (Hollensbe et al., 2014). Some academics draw upon cluster theory to propose ideal collective initiatives for promoting sustainable development (Lis and Radzio, 2023; Baldassare et al., 2019; Berkowitz, 2018; Ratten, 2018). Recently, there has been growing interest in the link between sustainable goals and clusters in academia (Derlukiewicz et al., 2020; Glinskiy et al., 2016). Clusters, intended as collective actors working with decision-makers to exploit and co-create regional advantages, can elevate specific ideas related to sustainable development to higher levels of diffusion (Hervás-Oliver, 2021). This cooperation is highly effective in coordinating joint efforts to implement changes (Bailey et al., 2018). The European expert group on clusters (2021) has affirmed that clusters have the potential to accelerate the twin green and digital transition, build resilience, and boost recovery. For instance, terms like blue economy, space economy, bioeconomy, or, more recently, forest economy (World Economic Forum, 2022) are spreading and entering our everyday language. These terms identify clusters composed of private and public actors engaged in different economic activities but who share a purpose: promoting responsible and innovative use of natural resources (Qui et al., 2024). The overarching goal of such clusters is to protect and preserve natural resources while promoting the adoption of sustainable practices and strategies that strike a balance between economic prosperity and ecological resilience. The pursuit of sustainable development is undoubtedly challenging. While clusters possess the capacity to influence firms' strategic objectives, foster social trust and acceptance, introduce and diffuse innovative activities, and enhance knowledge transfer, their effectiveness is not universal. The success of clusters hinges on a complex interplay of firm-specific and contextual factors. Moreover, the endeavor for sustainable development introduces new and intricate challenges that even configurations seemingly aligned with sustainability goals struggle to address. According to Nilson, Griggs, and Visbeck (2016) there are three primary challenges linked to sustainable goals: collective actions among different industries and different levels of action, complex compromise among different firms' aims, and, in general, among economic and sustainable aims; long-lasting mechanisms of coordination and action implementation. Additionally, Bennich et al. (2021) state that sustainability initiatives and agendas are not always coherent. While they

³ University of Napoli Parthenope
e-mail: eva.panetti@uniparthenope.it

promote virtuous changes, they inhibit or nullify respective visions and goals. More precisely, these new cluster configurations represent an agglomeration of industries that, to address contemporary sustainability issues efficiently, require more attention in two key areas: firstly, designing shareable strategies, and secondly, mitigating negative interactions by seeking trade-offs that maximize positive interactions (Bowen et al., 2017; Nilsson et al., 2018). For instance, in the case of the blue economy cluster, the aim is to preserve natural water resources. This purpose entails collaboration and convergence among maritime, energy, and tourism companies to reduce water pollution, minimize water wastage, preserve water wildlife, regulate the use of water-related sources of food, and address the unequal distribution of this vital resource (Shi et al., 2020; EU, 2021). These industries have different or overlapping sustainable goals, necessitating the complex negotiation of private and shared interests and priorities.

In the study of the bioeconomy, Bennich et al. (2021) have demonstrated that achieving theoretical sustainable objectives, such as those outlined in the 2030 agenda, is challenging in practice. Through quantitative analysis and simulation, they have revealed the difficulty in maintaining high levels of production efficiency while protecting biological resources. Therefore, alongside new coordination mechanisms, innovative solutions and processes are required to introduce disruptive ideas that enable a better balance between economic and sustainable goals.

Cluster theory has shown the potential of clusters in introducing and diffusing innovation (Huang and Wang, 2018). These findings provide additional evidence for scholars to consider clusters as a critical solution for sustainability. Qui et al. (2024) argue that clusters can promote the efficient use of resources through the innovative environment they create, thereby accelerating progress toward sustainability.

Despite this evidence and the validation by key institutional actors (e.g., the European Union), the advantages of clusters, as well as their innovation dynamics, should be carefully generalized and adapted to the context of this new cluster form in the era of sustainability, which we call purpose-driven clusters. Therefore, a more accurate analysis of cluster theory and a revision of theoretical assumptions are required, considering that in this new configuration of clusters, actors are aggregated around a joint and honorable purpose designed beyond the firms' mission statements but for the betterment of society.

Purpose of the paper. Hence, this trend, widely adopted by public actors (national, regional, local, and city governments) and associations or meta-organizations to promote sustainable and productive territorial strategies, demonstrates how the concept of clusters, though criticized by many theorists, may represent a valid solution for addressing sustainable challenges. However, such a critical role attributed to clusters re-opens a discussion on the topic. It reintroduces several unresolved issues related to cluster conceptualization, previously proposed by Martin and Sunley (2003). These include the level of industrial aggregation or the scope of industrial association and activities that could be included in a cluster, the lack of clear boundaries (both industrial and geographic), the strength of links, economic specialization, and the level of action in clustering processes (e.g., interfirm linkages, knowledge spillover, rivalry, and business and social networks).

Recent literature linking sustainability and clusters appears to reintroduce a consolidated concept without adapting it to the contextual application (Alberti and Belfanti, 2019), neglecting crucial aspects of sustainable challenges that may require the enrichment of cluster theory. We propose including sustainable clusters within a broader category of 'purpose-driven clusters' and accordingly reconsidering three fundamental dynamics inspired by Martin and Sunley's (2006) framework: aggregation rationale, proximity and boundaries, and strength of ties. The derived argumentation provides a critical review of purpose-driven cluster characteristics, proposing a set of propositions to explore for advancing research in this field.

Methodology. The paper proposes a theoretical framework based on the literature on industrial clusters to identify new theoretical propositions on clusters driven by sustainability purposes. Although the theory of clusters is well-established, it must be adapted to fully capture the peculiarities and dynamics of clusters that address current global needs in an era of sustainability. Recognizing that theory is an "abstraction and a simplification of reality" (Makadok, Burton, and Barney, 2018), we seek to identify salient aspects of cluster configurations that require revision or discussion for better practical application.

Our theory-building process follows Makadok, Burton, and Barney's (2018) framework, which introduces five levers of theorizing: modes of theorizing, levels of analysis or phenomena, causal mechanisms, constructs and variables, and boundary conditions. We focus on the blue economy, space economy, and bioeconomy. Adopting the same level of analysis of existing theories, we question the validity of traditional economic causal mechanisms such as agglomeration, knowledge transfer, cooperation, and innovation in light of shared sustainability purposes. Accordingly, we redefine, clarify, and broaden the cluster construct by discussing its most relevant dimensions of analysis: aggregation reason, proximity and boundaries, and ties.

Preliminary Results. In this ongoing and abbreviated version of the paper, we outline the critical aspects of the theoretical progression that lead to framing the concept of purpose-driven clusters. Clusters refer to a geographic concentration of interconnected firms collaborating to create a competitive advantage for themselves and the economy in which they operate (Porter, 1990). The concept of local concentration was initially introduced by Marshall (1980, 1920) with the notion of industry clusters and industrial districts, emphasizing the interconnection of economic activities, known as economic linkages. However, the success of Silicon Valley (Saxenian, 1994) and the academic significance of Porter's seminal work on "The Competitive Advantage of Nations" (1990) revitalized the concept of agglomeration among economic geographers, sociologists, and innovation economists, introducing a socio-cultural dimension.

Subsequently, this resurgence led to a proliferation of works and interpretations of clusters, resulting in theoretical and empirical confusion across various economic disciplines analyzing the phenomenon (Martin and Sunley, 2003;

Maskell and Kebir, 2006; Maskell and Malmberg, 2007). Although the cluster concept was operationalized differently, two core elements have remained central in most cluster definitions: the presence of related activities and the proximity (not necessarily geographical) of interconnected individuals and organizations (Catini et al., 2015).

The literature derives various benefits and advantages from these critical elements, assessed through empirical evidence. Some of these benefits can be traced back to Marshall's theories, wherein spatial and process adjacencies contribute to agglomeration economies. These economies, resulting from better access to skilled labor, specialized suppliers, and knowledge spillovers, lead to enhanced knowledge sharing, cost sharing and minimization, scope and scale economies, mutual trust, and virtuous competition (Marshall, 1920). Additionally, apart from internal benefits, agglomeration also extends positive effects at the societal level by increasing productivity, economic growth, and innovation within the local area where the cluster operates (Porter, 1990).

Although core elements and many of these benefits have been widely evidenced in different configurations of clusters (e.g., industrial clusters, regional clusters), the following results highlight the need for adaptations when clusters are proposed as a solution to pursue sustainable development, particularly in configurations driven by purpose, where different firms are required to collaborate not for optimizing economic goals, but for interests of future generation such as for the natural resource protection.

As Martin and Sunley (2003) outlined, the level of industrial aggregation and the range of industrial relationships and activities included in a cluster have evolved over time, shifting from product/process aggregation to geographic location. In the era of sustainability, the reason for aggregation undergoes further variation: following a common purpose based on the protection of a shared resource. Current cluster configurations center around a specific and shared natural resource, such as water, soil, or space. Such a broad level of aggregation results in the inclusion of heterogeneous actors from diverse industries or clusters.

Therefore, we develop the following proposition:

P1. In a purpose-driven cluster, actors are heterogeneous in nature and specialization but share a common positive intent toward society.

Indeed, since the beginning, the cluster concept has described links among entities with different characteristics in terms of industries and types of actors (corporations, associations, institutions), but with a more precise individual aim focused on a specific activity for the creation and distribution of a final product or service in a particular area. In contrast, in a natural resource-based cluster, the overall purpose is much more explicit than the individual purpose. In other words, the general goal of "resource protection" is more evident than what each firm in the cluster should do concretely to reach the common purpose.

Consequently, the greater the number of involved actors, the more pronounced the lack of clear industrial and geographic boundaries. The proximity element requires specific argumentation to identify boundaries and belonging to the cluster. Referring to the five dimensions of proximity proposed by Boschma (2004) - geographical, cognitive, social, organizational, and institutional proximity - we argue that in a resource-based cluster:

a) Geographical proximity regains attention but is related to the location of the natural resources to be protected rather than to the location of other cluster's firms. For example, all international shipping companies, even those not based in the Mediterranean, are included in protecting the Mediterranean Sea.

b) Cognitive proximity, intended as the similarity of competencies and technologies, risks being reduced and dispersed due to the variety of actors involved. Therefore, it is helpful to leverage cognitive proximity to sustainable objectives.

c) Organizational proximity becomes more relevant due to the necessity of work division not only based on firm specialization but also on firms' linkage with the sustainable problems to solve and the sustainable actions needed, aiming to avoid overlapping and frictions.

d) Social proximity is less characteristic, as stable relationships require dynamics and openness to avoid compromising sustainable transactions.

e) Institutional proximity maintains its relevance but increases in complexity due to the alignment of norms among multiple industries and resources.

Therefore, we develop the following propositions:

P2. In a purpose-driven cluster, boundaries are blurred and extensive. The geographical identification of actors involved is associated with the localization of natural resources.

P3. In a purpose-driven cluster, cognitive proximity is measured considering similarities in sustainable objectives.

P4. In a purpose-driven cluster, organizational proximity is associated with the commonality of problems to solve and the required action.

P5. In a purpose-driven cluster, social proximity exhibits instability and dynamism.

P6. In a purpose-driven cluster, the institutional proximity is weak and associated with heterogeneity of norms.

The variety of links required to achieve sustainable development goals across industries also affects the strength of ties that have been useful in cluster evidence thus far. The lack of necessary localization, as well as the mix of companies and industries, suggests a lack of strong ties (Pablo-Martí and Arauzo-Carod, 2020) or the dispersion of strong ties, leading to the proliferation of weak ties and producing a mix of consequences on knowledge transfer and innovation (Huang and Wang, 2018). However, unlike the traditional view of clusters, where cluster activities are driven by small

but influential groups of actors with strong ties, in a resource-based cluster, activities are carried out by multiple groups with separate strong ties.

Furthermore, unlike Huang and Wang (2018), who illustrated the evolution over time between weak and strong ties in industrial clusters considering trust and knowledge complexity, we hypothesize a less linear relationship among different types of ties. This nonlinearity may result from the incidence and necessity to address multiple (and not simply aligned) sustainable aims. In other words, the network geometry will be variable (a mix of strong and weak ties) and switch between weak and strong relationships and vice versa. Revising ties' purpose, boundaries, and strengths has consequences in explaining coordination mechanisms among entities, conflicts and solutions, knowledge transfer, and innovation.

Contrasting yet virtuous dynamics can be observed by focusing on knowledge and innovation. The negative aspects include the presence of forced weak ties, which are firm connections mandated by norms and regulations that may not easily lead to explorative knowledge and radical innovation, as well as strong and inhibitory ties resulting from existing long-term relations that could hinder disruptive changes, favoring incremental and continuous solutions over radical ones. On the positive side, the heterogeneity of actors favors the variety of ties and the emergence of recurring weak relationships, which could facilitate the emergence of iterative innovation.

These theoretical arguments lead us to develop the seventh proposition:

P7. In a purpose-driven cluster, a spectrum of strong and weak ties exists, with non-linear relationships, fostering the emergence of iterative innovation.

Table 1 sum-up preliminary results and propositions.

Table 1. Characteristics and proposition of purpose-driven cluster

Cluster elements	Characteristics	Proposition
Aggregation Reason	Overarching and common purpose for benefiting the natural environment and society	P1. In a purpose-driven cluster, actors are heterogeneous in nature and specialization but share a common positive intent toward society.
Boundaries and Proximity	Boundaries Spread and blurred boundaries Proximity -Geography of resources -Cognitive proximity of sustainable objectives -Organizational proximity based on problems and action, not only on specialization -Dynamic and open social proximity -Institutional proximity among industries and resources	P2. In a purpose-driven cluster, boundaries are blurred and extensive. The geographical identification of actors involved is associated with the localization of natural resources. P3. In a purpose-driven cluster, cognitive proximity is measured considering similarities in sustainable objectives. P4. In a purpose-driven cluster, organizational proximity is associated with the commonality of problems to solve and the required action. P5. In a purpose-driven cluster, social proximity exhibits instability and dynamism. P6. In a purpose-driven cluster, the institutional proximity is weak and associated with heterogeneity of norms.
Ties (strong vs weak)	Ties varieties: strong and weak Nonlinear relationship among weak and strong ties, based on incidence and necessity	P7. In a purpose-driven cluster, there are various strong and weak ties, with non-linear relationships that favor the rise of recurring innovation.

Research limitations. Still in progress, the paper delves into theoretical discussions on clusters and sustainability, specifically focusing on a cluster configuration aimed at preserving a natural resource. These configurations represent a common form of agglomeration driven by a shared purpose, which we label "Purpose-driven Clusters." Some forms of clusters for sustainability have already been addressed in the literature, particularly those of eco-industrial clusters, which are excluded from our discussion as they align more with the traditional description of industrial clusters, focusing on industrial processes rather than a common and shared purpose. However, although the paper adopts an inductive approach, it lacks a detailed description of empirical evidence derived from observable dynamics in blue, bio, and space economies. Additionally, by focusing solely on three cluster elements, the paper overlooks other aspects that may warrant attention, such as governance mechanisms and interfirm conflict resolution. Finally, a better integration of existing sustainable development theories could enhance cluster analysis's theoretical underpinnings and help identify theoretical assumptions for best practices.

Managerial implications. The theoretical adaptation of the concept of industrial clusters in the era of sustainability brings forth several implications. The new conceptualization may assist firms and policymakers in becoming more aware of which aspects to leverage to initiate a sustainable transition. Policymakers are encouraged to adopt a less deterministic and superficial approach when designing top-down cluster configurations and, instead, to consider the complexity of challenges that will arise during cluster performance. Firms are urged to be more receptive to a new idea of aggregation that prioritizes the preservation of the planet even above their interests.

Originality of the paper. Despite the increasing availability of several empirical examples, theoretical research that might contribute to theorizing on the topic is mainly missing (Alberti and Belfanti, 2019). Scholars often rely on applying

more recent literature on clusters to interpret current cases in the “real” environment, offering only partial explanations. The paper aims to re-open a conversation on cluster dynamics to understand characteristics, potentialities, and the existing limitations that make a cluster configuration a key factor for sustainable development. The originality of this paper lies in its focus on theoretical aspects of clusters within the context of the sustainable economy. Existing literature typically examines standard industrial configurations to investigate the effects of this virtuous agglomeration. In contrast, this paper delves into understanding the specific nature of their functioning, introducing a new form of aggregation labeled “Purpose-driven Cluster”.

The Power of Interactions. Exploring Stakeholder Adoption of pro-social practices from purpose-driven companies

MARTINA TAFURO¹ ANDREA PICCALUGA²

Abstract

The management literature has recently focused on reimagining capitalism through the lens of corporate purpose. Although many scholars have theoretically conceptualised this discourse and its connection to stakeholder theory, empirical studies are needed to further contribute to this ongoing debate. As society demands greater responsibility and ethical conduct, understanding stakeholder engagement with purpose-driven companies is crucial. This qualitative research aims to explore the complex relationship between purpose-driven companies and their stakeholders. The study focuses on understanding the various factors that influence stakeholder adoption of pro-social practices promoted by purpose-driven companies and the interaction mechanisms through which this adoption takes place. We are obtaining these insights from an extensive data collection that included 30 semi-structured interviews with key stakeholders, three participant observations, and a meticulous analysis of secondary data, such as organizational documents, industry reports, and existing literature. The preliminary findings of our study shed light on several key factors and ways that characterize the adoption of pro-social practices by stakeholders. These factors include organizational culture, leadership support, communication strategies, and the perceived alignment with stakeholder values. Our research highlights also the importance of fostering collaborative relationships between purpose-driven through both formal and informal interaction mechanisms. Formal mechanisms include structured stakeholder engagement processes; on the other hand, informal mechanisms involve structured interactions, which establish clear expectations and obligations between companies and stakeholders. We aim to contribute to both theoretical advancement and practical implications for stakeholder theory and the literature on corporate purpose. Our analysis aims to reveal how purpose-driven companies can engage with stakeholders to achieve shared purposes and create positive social change. Purpose-driven companies can contribute to the common good by fostering transparency, accountability, and trust. Ongoing dialogue and collaboration between companies and their stakeholders are necessary to ensure alignment with evolving societal expectations and values. Ultimately, fostering a mutual relationship between purpose-driven companies and their stakeholders can pave the way for the adoption of pro-social practices and driving positive societal impact.

Keywords: purpose-driven companies; stakeholders engagement; interaction mechanisms; pro-social practices

Framing of the research. *In recent decades, there has been a significant shift in the business landscape. Many companies have moved away from prioritising shareholders and have instead adopted pro-social practices that cater to the needs of all stakeholders (Battilana et al., 2022). This shift from the traditional shareholder-centric model to a stakeholder-centric one has been crucial in fostering a more inclusive, fair, and sustainable approach to growth (Mayer, 2021). The stakeholder approach highlights the significance of considering the interests of all groups involved (Freeman et al., 2020). It provides valuable insights into the role of companies in supporting the holistic experiences of stakeholders (McGahan, 2023), contributing to their flourishing (von Ahnen and Gauch, 2021). Companies can effectively engage stakeholders in their needs and expectancies by aligning their goals with a shared purpose that promote value creation and equitable distribution of resources (McGahan, 2023). In this context, the shift towards a stakeholder-centric approach has significant implications for corporate purpose, as it directly impacts stakeholder involvement and engagement (George et al., 2023; Harrison et al., 2023). As such, purpose-driven companies do have unique characteristics that distinguish them in the business landscape. They are companies that prioritize long-term sustainability over short-term profits, acknowledge the interdependence between profit and pro-social purpose (Henderson, 2021). Accordingly, purpose-driven practices emphasise the importance of aligning organisational goals with broader societal values and aspirations, promoting positive change and sustainable development for all stakeholders (Freeman et al., 2020). Indeed, many companies are publicly declaring purpose statements that attest their commitment to creating a positive impact beyond financial returns (e.g. Mayer, 2016). These statements guide decision-making and strategic direction (Almandoz, 2023). Purpose-driven companies also promote accountability and transparency by*

² Sant'Anna School of Advanced Studies, Pisa
e-mail: andrea.piccaluga@santannapisa.it

measuring and reporting their social and environmental performance to stakeholders (Stroehle et al., 2019). This effort to guarantee transparency not only fosters trust with stakeholders but also encourages ongoing improvement and innovation in pursuit of purpose-driven objectives (Henderson, 2021). Purpose-driven companies often show higher levels of innovation and creativity as they are motivated by a desire to solve pressing societal issues and create “architectural” change (Henderson, 2021). As companies adopt a purpose-driven approach, it is crucial to acknowledge the broader context in which they operate, exploring their interactions with stakeholders (Gulati and Wohlgezogen, 2023). Building stronger and more resilient organizations that are better equipped to navigate complex challenges and seize new opportunities by acknowledging and addressing the needs and concerns of stakeholders (Florez-Jimenez et al., 2024), but also act proactively to push for the change, they have the potentiality to become agents of change (Almandoz, 2023).

Purpose of the paper. Corporate purpose is essential for promoting the well-being of stakeholders, both within and outside of companies (Freeman et al., 2020). Accordingly, George et al. (2023) stated that “Purpose in the for-profit firm captures the essence of an organization’s existence by explaining what value it seeks to create for its stakeholders. In doing so, purpose provides a clear definition of the firm’s intent, creates the ability for stakeholders to identify with, and be inspired by, the firm’s mission, vision, and values, and establishes actionable pathways and an aspirational outcome for the firm’s actions” (p. 1848). The stakeholder approach provides useful insights into the role of companies in promoting comprehensive stakeholder experiences, based on the pursuit of shared goals for value creation and distribution (McGahan, 2023). As von Ahsen and Gauch (2021) emphasise, it is essential to design a long-term purpose and communicate it regularly to stakeholders. This development has enabled a deeper exploration of purpose, which is attentive to broader groups of stakeholders rather than solely from the maximization of the profit of the companies (Harrison et al., 2020). As a result, purpose-driven companies act as enablers in promoting the common good of stakeholders (Almandoz, 2023; Frémeaux and Michelson, 2017), collaborating to manage stakeholder engagement (Kaplan, 2023). The achievement of corporate purpose is a collective effort that involves both internal and external stakeholders in a dynamic and mutually beneficial relationship (Rindova and Martins, 2023). This dynamic nature is expected to significantly impact the company’s relationships with its stakeholders, promoting new interaction mechanisms to guide their engagement with the company towards a shared purpose that go beyond profitability (Bacq and Aguilera, 2022; Rindova and Martins, 2023). In addition to shaping the company’s purpose, the collaborative formulation process fosters a sense of ownership and commitment among stakeholders. This leads to deeper alignment with the organization’s mission and values (George et al., 2023). Furthermore, by integrating diverse perspectives and insights from stakeholders, the company can develop more holistic and inclusive strategies that address a wide range of societal and environmental concerns (Almandoz, 2023; Mayer, 2016; Mayer, 2021). This approach enhances stakeholder engagement and strengthens the company’s resilience and adaptability in navigating complex and rapidly evolving business landscapes (Florez-Jimenez et al., 2024). Since purpose encompasses not only objectives, goals, and tasks of companies but also moral, ethical, and value-driven directions (George et al., 2023; McGahan, 2023; Almandoz, 2023), it can foster multistakeholder action (Gulati and Wohlgezogen, 2023) and orchestrated change (Henderson, 2021). However, navigating purpose dynamics presents a significant challenge for companies, prompting ongoing debates about effective interaction mechanisms (von Ahsen and Gauch, 2021). This highlights the need for further research to investigate how stakeholders engage and interact with organizations (McGahan, 2023). Addressing this critical gap, our research aims to explore the relationship between purpose-driven companies and their stakeholders. The aim of this research is to explore the feasibility of stakeholders adopting pro-social practices from the interaction with purpose-driven companies. Additionally, we aim to elucidate the dynamics of enablers and barriers that shape this adoption as interaction mechanisms. By shedding light on these dynamics, our research aims to contribute to a deeper understanding of stakeholders engagement with purpose-driven organizations and inform strategies for enhancing the effectiveness of pro-social practices within and beyond companies’ boundaries.

Methodology. We are investigating the adoption of pro-social practices by stakeholders within purpose-driven companies using a grounded theory approach (Glaser and Strauss, 1967). Grounded theory facilitates the generation of theoretical insights from empirical data, allowing for an inductive and iterative analysis process (Glaser and Strauss, 1967). This methodology enables us to generate theoretical insights from empirical data, enabling an inductive and iterative analysis process. The grounded theory approach is well-suited for exploring complex and dynamic phenomena, such as the interactions between purpose-driven companies and their stakeholders. Our research design integrates both primary and secondary data sources to obtain a comprehensive understanding of the phenomenon under investigation (Jonsen and Jehn, 2009).

Research setting

Our identification of Italian purpose-driven companies relies on the application of the following screening criteria. First, the presence of a corporate purpose statement on the official website, which must include at least one of the following terms: purpose, (ultimate) goal, guiding principle, or objective beyond profit related to social concerns. Second, the explicit allocation of resources and investments to the achievement of the corporate purpose, in accordance with the principles outlined by the British Academy (2019, p. 895). Third, the possession of a B-Corp certification. Companies meeting a minimum of two out of three of those criteria underwent two validation tests. Initially, a focus group was conducted prior to data collection, involving three independent academic experts specializing in “purpose”. This step ensured the accuracy of our selection and validated our research and interview protocols. During the focus group, eight potential purpose-driven companies were identified. Subsequently, we selected only those companies that scored a minimum of 15 in a preliminary self-evaluation directed to CEOs, based on the 7-point Likert scale developed by Bhattacharya et al. (2022). This process resulted in the selection of three purpose-driven companies with a relatively

long life (minimum 10 years) and a relatively large size (more than 250 employees). Starting from these three purpose-driven companies, we are selecting randomly a certain number of internal managers and external managers from supplier and customer groups.

Data collection

Primary data collection is involving 30 semi-structured interviews with key stakeholders, including managers, and external suppliers and customers allowing for rich insights into their perceptions, experiences, and behaviours related to pro-social practices. We are collecting data of two main group of interviews through two different interview protocols respectively: managers of the purpose-driven company, and managers of the stakeholders' companies among suppliers and customers groups. Our primary data consist of preliminary meetings, semi-structured individual interviews lasting 45 minutes on average, follow-up mails. Additionally, we conducted three participant observations at each of the three purpose-driven companies' sites to gather further insights. Participant observations are crucial for gaining firsthand insights into the daily operations and interactions within purpose-driven companies' environments. Additionally, secondary data from existing literature, industry reports, and organizational documents are utilized to contextualize and enrich our findings, enabling triangulation and validation of emergent themes (Glaser and Strauss, 1967; Jonsen and Jehn, 2009).

Data analysis

Firstly, open coding involves breaking down data into discrete units to identify initial concepts and categories. Subsequently, axial coding facilitates the exploration of relationships between these concepts, enabling the emergence of higher-order themes and theoretical constructs. We are developing a framework that encapsulates the complex interactions between purpose-driven companies and their stakeholders, organizational practices, and contextual influences. Triangulation techniques are being employed to compare findings across different data sources and ensure the validity and reliability of our interpretations.

Results. The aim of the data analysis is to identify key findings on the adoption of pro-social practices by internal and external stakeholders of purpose-driven companies. The analysis will identify varying levels of awareness and understanding among stakeholders regarding the pro-social practices implemented by their respective companies, which may influence the degree of engagement and commitment towards these initiatives. It is expected to identify factors which facilitate or hinder stakeholders' adoption of pro-social practices, such as organizational culture, leadership support, and perceived benefits, will emerge. Additionally, adoption patterns are likely to vary among different stakeholder groups, with employees, customers, and suppliers displaying differing levels of involvement and receptiveness. This study will examine the impact of leadership support on stakeholder engagement and adoption of pro-social practices. Effective leadership can significantly influence organizational culture and enhance stakeholder trust and commitment by championing purpose-driven initiatives and advocating for stakeholder interests. Contextual factors, such as industry dynamics and market conditions, are expected to significantly influence stakeholder perceptions and behaviours towards the diffusion of pro-social practices. Moreover, this study aims to investigate the potential impact of external factors, such as regulatory frameworks and industry standards, but also voluntary certifications (e.g. B-Corps) on stakeholders' attitudes and behaviours towards adopting pro-social practices. By examining how external factors interact with internal dynamics within purpose-driven companies and external interaction mechanisms with stakeholders, valuable insights can be gained into the broader context in which these organizations operate and the challenges they face in driving meaningful societal impact. Furthermore, we aim to explore the enduring consequences of stakeholder involvement with purpose-driven enterprises, including its impact on brand image, customer retention, and financial outcomes. Through an examination of the outcomes of sustained stakeholder engagement initiatives, we aim to uncover best practices and lessons learned. This will inform future strategies for enhancing the effectiveness of pro-social practices adoption and maximizing the positive impact of purpose-driven companies on society. Our research aims to investigate also what are the mechanisms of interaction between purpose-driven companies and their stakeholders. We expect to identify both formal and informal mechanisms activated by purpose-driven companies to diffuse pro-social practices among their internal and external stakeholders. Formal mechanisms include structured stakeholder engagement processes, such as advisory boards, regular meetings, and formal feedback mechanisms. These provide structured channels for stakeholders to voice their concerns and contribute to decision-making processes and strategic alliances around a shared purpose. On the other hand, formal mechanisms involve structured interactions, such as contracts, agreements, and policies, which establish clear expectations and obligations between companies and stakeholders. Informal mechanisms, on the other hand, involve spontaneous interactions, such as social events, networking opportunities, and informal discussions, which facilitate relationship-building and trust-building between companies and stakeholders on a more personal (and authentic) level. Understanding both formal and informal interaction mechanisms can provide insights into the dynamics of stakeholder engagement. This can help to identify the factors that influence the effectiveness of these interactions in promoting the adoption of pro-social practices and driving positive societal impact.

Research limitations. The research relies on qualitative data obtained through interviews and secondary sources, which may be subject to researcher bias and interpretation. Efforts are being made to mitigate bias through triangulation and member checking. Furthermore, it is important to consider that the sample size and selection criteria for stakeholders could have impacted the range and depth of insights gathered, potentially resulting in the exclusion of perspectives from specific stakeholder groups or organizational contexts. Additionally, the qualitative nature of the research allows for a rich exploration of stakeholder perspectives and experiences, providing valuable insights into the complexities of

stakeholder engagement with purpose-driven companies. Despite efforts to ensure rigor and validity, it is essential to acknowledge the inherent subjectivity in qualitative research, which may influence the interpretation of findings.

Managerial implications. The aim of our research is to provide practical recommendations for purpose-driven companies seeking to strengthen their relationships with stakeholders and increase their social and environmental impact through a comprehensive analysis of these mechanisms. The findings of this research could have significant implications for managers and organisational leaders who aim to enhance stakeholder engagement and adoption of pro-social practices within and beyond purpose-driven companies. We expect to identify best practices and lesson learned to foster the diffusion of pro-social practices in the context of the purpose-driven companies. For instance, to effectively tailor communication and engagement strategies, it is crucial to understand stakeholders' varying levels of awareness and perception; or even more, emphasise shared values and benefits for all stakeholders can enable the diffusion effect. Additionally, creating a supportive organisational culture and securing leadership commitment are essential for fostering an environment conducive to stakeholder participation and buy-in. Demonstrating commitment to social responsibility and sustainability can increase trust and confidence among stakeholders, motivating them to actively support and contribute to the company's purpose-driven goals. Managers must recognise the diverse needs and expectancies of different stakeholder groups and tailor engagement strategies accordingly and our research might help to recognise the best practices to achieve this goal. By comprehending and addressing the concerns and motivations of each stakeholder group, managers can develop stronger relationships and encourage a sense of shared ownership in a shared purpose. Additionally, managers must continuously monitor and evaluate their stakeholder engagement efforts. To ensure ongoing alignment and balance with stakeholder expectations and organizational goals, managers should solicit feedback and adapt their strategies as needed. We expect that our participant observations are crucial in this process as they provide firsthand insights into stakeholder interactions and behaviours, enabling managers to make informed decisions and adjustments to their engagement strategies. Overall, our research empirically explore how purpose-driven companies can cultivate more meaningful and impactful relationships with their stakeholders. So, it can recognise managerial implications also for stakeholder companies, both suppliers and customers, helping them to recognise the mechanisms for the diffusion of pro-social practices activated by purpose-driven companies.

Originality of the paper. This research offers several original contributions to the existing literature on purpose-driven companies and stakeholder theory (Bartlett and Ghoshal, 1994; Mayer, 2021; Bhattacharya et al., 2022; Zenger, 2023). Firstly, by focusing on the relationship between purpose-driven companies as agents of change for their stakeholders, we are addressing a significant gap in the literature, which has predominantly focused on purpose as a response to external pressures and expectancies. Our research uniquely provides a comprehensive understanding of how purpose-driven initiatives influence stakeholder adoption of pro-social practices as agents of change. Furthermore, our research goes beyond merely examining the existence of purpose-driven initiatives within companies to delve into the dynamics of stakeholder adoption outside companies' boundaries. By exploring enablers and barriers that shape stakeholder engagement with purpose-driven companies, we offer valuable insights into the interaction mechanisms underlying their relationships. Additionally, our research adopts an empirical approach, allowing for in-depth exploration and contextualization of purpose-driven companies phenomenon of inquiry. This empirical foundation enhances the credibility and applicability of our findings, contributing to a more nuanced understanding of the role of purpose-driven companies in driving positive social change and promoting societal well-being.

B-Corp: un esame delle aziende alimentari Italiane attraverso la Teoria dei Segnali

NORA ANNESI¹ VALENTINA CUCINO²

Abstract

Le nuove normative europee sulla responsabilità sociale delle imprese private impongono una maggiore assunzione di responsabilità nei confronti dell'ambiente e della società. La CSR-D e la CSDD-D ampliano le imprese soggette alla rendicontazione di sostenibilità e richiamano l'adozione di azioni concrete per la sostenibilità e il rispetto dei diritti umani. Questo scenario ha spinto molte imprese a cercare la certificazione B-Corp per trasformarsi in entità più sostenibili. Attraverso la Teoria dei Segnali, l'articolo proposto analizza la comunicazione delle imprese B-Corp rispetto alle implicazioni manageriali derivanti da tale certificazione. La comunicazione analizzata è quella rivolta al pubblico più ampio di stakeholder, ovvero quelli raggiunti attraverso i social media. Le ricercatrici, attraverso la Teoria dei Segnali valutano la coerenza tra ciò che le imprese comunicano e ciò che la certificazione implica. I risultati indicano che solo una piccola percentuale dei post si concentra sullo status B-Corp e che alcune dimensioni importanti, come le metriche di governance, sono trascurate. Questo solleva l'importanza della consapevolezza interna e della selezione dei fornitori di servizi di comunicazione per garantire una comunicazione completa e accurata riguardo alla certificazione B-Corp. Altra dimensione rilevata è infine quella della consapevolezza e dell'interesse dello stakeholder nei confronti di questo tipo di informazioni.

Key words: *b-corp; Teoria dei Segnali; communication; sustainability; transition; food*

Contesto della ricerca. *Le nuove normative europee sulla responsabilità sociale del settore privato stanno aumentando le responsabilità che le imprese dovrebbero prendersi (e che dovrebbero poi rendicontare e comunicare) nei confronti dell'ambiente e della società. In particolar modo, la CSR-D, quale Corporate Sustainability Reporting Directive, da un lato dal 2022 ha allargato la compagine di imprese sotto obbligo di rendicontazione di sostenibilità. Dall'altro lato, la CSDD-D, quale Corporate Sustainability Due Diligence Directive, richiama la necessità di avviare piani e azioni concrete e misurabili orientate alla sostenibilità ed in particolar modo alla riduzione degli impatti ambientali, alla lotta al cambiamento climatico e al rispetto dei diritti umani dei lavoratori dell'intera catena del valore. Essenzialmente le imprese si trovano a fronteggiare un trend di pressioni crescenti rispetto alla sostenibilità a partire dal 2013 con l'introduzione della Direttiva 2013/34/UE "per quanto riguarda la comunicazione di informazioni di carattere non finanziario e di informazioni sulla diversità da parte di talune imprese e di taluni gruppi di grandi dimensioni".*

In questo contesto molte imprese stanno cercando certificazioni o modelli che le guidino verso una configurazione aziendale più sostenibile (Moroz & Gamble, 2021). Dal 2013, con l'emergere della certificazione B Corp, molte imprese hanno avviato e completato il processo di transizione verso la sostenibilità, rispettando i requisiti per ottenere lo status di B Corp e impegnandosi a mantenere questo stato e migliorare le proprie performance nel tempo. Il movimento delle B Corp è in costante crescita, come confermato da una ricerca de Il Sole 24 Ore³ che ha evidenziato un aumento del 26% delle imprese certificate come B Corp in Italia nel 2021.

A causa delle normative più stringenti, specie tra il 2023-2024, B-Lab, l'organizzazione promotrice della certificazione, ha avviato un processo di consultazione pubblica finalizzato a raccogliere opinioni su come migliorare e integrare i contenuti dell'attuale certificazione per renderla rispondente all'evoluzione legislativa e all'aspettativa degli stakeholder sulle b-Corp e sulle imprese in generale. La certificazione B Corp attraverso opportuna etichetta di marchio, consente di segnalare graficamente che l'impresa che ha generato il prodotto/servizio aderisce ad un network in cui il modello di condotta responsabile e l'attenzione alla sostenibilità sono una priorità (Cao et al., 2017; Conger et al., 2018; Navis & Glynn, 2011). In questo contesto, i segnali inviati agli stakeholder circa il proprio impegno sono particolarmente importanti. Trovare beneficio dell'impegno profuso attraverso una comunicazione che valorizzi l'impresa agli occhi degli stakeholder è quindi cruciale (Battilana, 2018; Navis & Glynn, 2011). Difatti l'adesione alla certificazione B-corp

³ https://www.ilsole24ore.com/art/la-pandemia-spinge-bcorp-26percento-italia-2021-AE7VTGFB?refresh_ce=1

comporta una serie importante di implicazioni manageriali che devono portare l'impresa ad adeguarsi, qualora non rientri a pieno nel modello definito dalla certificazione, e a mantenere tale struttura nel tempo.

Sebbene siano molti gli studi che hanno analizzato l'aspetto della certificazione B-corp, investigando dei suoi effetti positivi (Conger et al., 2018; Gehman & Grimes, 2017; Moroz et al., 2018) e dei suoi effetti negativi (Liute & De Giacomo, 2022), pochi si sono concentrati sul processo di transizione che l'azienda vive nel passaggio a B-corp. Inoltre, i fondatori del movimento B-corp hanno invitato più volte negli anni gli studiosi di management a indagare le peculiarità degli approcci adottati dalle B corp anche rispetto ai propri stakeholder (Muñoz et al., 2018).

In particolare, quando ottiene una certificazione B corp, l'azienda ha necessità di segnalare ai propri stakeholders la transizione da un modello classico a un modello che integra all'interno della propria cultura organizzativa i principi di sostenibilità. In questo passaggio, si creano delle asimmetrie informative tra l'azienda e lo stakeholder che devono essere bilanciate. In particolare, da un lato gli stakeholder cercano segnali – azioni osservabili che forniscono informazioni su attributi non osservabili e risultati probabili (Spence, 1974) – che aiutino a colmare il divario tra ciò che gli stakeholder sanno dell'azienda e ciò che vogliono sapere (Miller e Triana, 2009), dall'altro, le aziende hanno il bisogno di inviare dei segnali di qualità agli stakeholders.

In questo contesto, l'utilizzo della Teoria dei Segnali come strumento per osservare i segnali inviati dalle imprese certificate B-corp attraverso i propri canali di comunicazioni circa il loro impegno per la sostenibilità e le proprie attività in quanto B-corp, rappresentano il contesto strategico per identificare gli spazi di miglioramento dell'attuale sistema di certificazione. La teoria dei segnali sta guadagnando crescente popolarità negli studi di management (Bergh e Gibbons, 2011; Connelly et al., 2011). Questa crescente popolarità è legata al fatto che la teoria indaga i meccanismi attraverso i quali gli individui e le organizzazioni trasmettono e interpretano le informazioni. Più specificamente, la teoria dirige l'attenzione sulle sfide fondamentali affrontate dai decisori strategici, affrontando in particolare come possono utilizzare i segnali per mitigare l'incertezza associata alla selezione da un insieme di scelte in situazioni caratterizzate da informazioni incomplete e distribuite asimmetricamente (Spence, 2002).

In particolare, l'ottenimento della certificazione B Corp offre l'opportunità di comunicare agli stakeholders gli sforzi di sostenibilità dell'azienda, principalmente grazie al miglioramento dell'esposizione mediatica, sbloccando vantaggi strategici (Chauhan & O'Neill, 2020; Conger et al., 2018; Grimes et al., 2018) e acquisendo distintività in un ambiente altamente competitivo (Harjoto & Laksmana, 2018). Inoltre, la certificazione B Corp aiuta le imprese sostenibili a entrare in una determinata categoria visibile che dà credito al loro impegno verso impatti sociali e ambientali positivi (Paelman et al., 2020), genera guadagni di reputazione e legittimità, nonché networking e, potenzialmente, benefici finanziari (Conger et al., 2018; Gehman & Grimes, 2017; Moroz et al., 2018). Attraverso la lente della Teoria dei segnali, gli autori hanno quindi avviato una analisi dei canali social di un cluster di imprese italiane certificate B-corp. Tale contesto rappresenta il campo di osservazione indiretta per rispondere quindi alle seguenti domande: Quali implicazioni manageriali derivanti dall'ottenimento della certificazione b-corp vengono comunicati agli stakeholder dalle imprese? Quali sono i potenziali miglioramenti della certificazione b-corp che possono essere rilevati dall'analisi della comunicazione delle imprese b-corp?

Scopo del paper. In questo contesto il contributo presentato fornisce un approfondimento della comunicazione avviata da una impresa dopo aver completato il processo di transizione a B corp ed averne ottenuto la relativa certificazione. Tale transizione rappresenta un impegno verso un modello di business più responsabile nei confronti della società. L'ottenimento, ed il mantenimento, della certificazione di B-corp impone infatti una attenzione al benessere degli individui e della società riletto attraverso le dimensioni chiave della sostenibilità e dei criteri ESG. In questo senso la dimensione della Governance copre un aspetto significativo delle richieste presenti all'interno del processo di certificazione a B-Corp. Metriche e policy adottate nei confronti dei dipendenti, della comunità e dei supplier, così come il livello di trasparenza interna ed esterna raggiunto, sono parte di questo processo di transizione e possono trovare evidenza all'interno de essere incluse anche nei sistemi di comunicazione avviata dalle organizzazioni.

Lo scopo di questo contributo è quindi comprendere se e quali messaggi comunicano le imprese che hanno ottenuto lo status di B-Corp in relazione agli aspetti su cui la certificazione B-Corp ha posto particolare attenzione. In termini di Teoria dei Segnali, lo studio intende osservare il contenuto del messaggio trasmesso dall'impresa attraverso i propri canali di comunicazione. Al fine di fornire un quadro completo che tenga conto delle prospettive sia dell'impresa che degli stakeholder, l'obiettivo del paper è anche valutare la reazione e il livello di apprezzamento di coloro che, esposti a questa comunicazione, hanno scelto di fornire un feedback.

In particolare, secondo la teoria dei segnali, all'interno di un ambiente di segnalazione il mittente (l'azienda B corp) decide come comunicare (o segnalare) quell'informazione (passaggio ad un modello Bcorp) e il destinatario (stakeholder) decide come interpretare l'informazione (segnale) e fornisce feedback (Connelly et al., 2011). L'ambiente di segnalazione è dove appare il segnale, il mittente o il segnalatore sarebbe l'azienda (nel nostro caso la Bcorp), il segnale potrebbe essere un messaggio, un reclamo o un'etichetta (in questo caso il post sui social), il destinatario sarebbe lo stakeholder che tenta di interpretare il segnale (in questo caso la reazione al post), e il feedback sarebbe fornito da un acquisto, un commento sui social o un messaggio inviato all'azienda (nel nostro caso il commento al post)

Metodo. L'analisi si è articolata in tre fasi. Nella prima fase, sono state selezionate tutte le imprese italiane BCorp operanti nel settore alimentare e ufficialmente registrate sulla piattaforma istituzionale dell'iniziativa B-Corp. Il settore alimentare è stato selezionato dagli autori in virtù della sua rappresentatività all'interno dell'industria italiana come mostrato da diversi studi (Annesi and Cucino, 2023; Passarelli et al., 2023). Infatti, questo settore riveste un ruolo significativo nell'economia italiana, contribuendo in modo sostanziale al PIL nazionale e all'occupazione. Successivamente, al fine di esplorare il sistema di comunicazione relativo alle tematiche B-corp, gli autori hanno ritenuto

opportuno focalizzarsi sul sistema di comunicazione che prevede, in linea con la Teoria dei Segnali, uno scambio di comunicazioni e reazioni tra impresa e stakeholder. In questo senso sono oggetto di questa analisi i canali social (Instagram o Facebook) delle imprese selezionate. Di conseguenza le aziende prive di un profilo social sono state escluse dall'analisi. Il risultato ha portato a 14 imprese italiane B-corp operanti nel settore alimentare e ufficialmente iscritte alla piattaforma istituzionale dell'iniziativa B-corp.

Nella terza fase, i ricercatori hanno selezionato le due piattaforme che tutte le 14 imprese avevano attive ovvero il canale Instagram ed il canale Facebook. Il segnale attivato dall'impresa dopo aver completato il processo di transizione a B-corp è stato analizzato tramite analisi qualitativa dei contenuti dei post (content analysis) contrassegnati con un hashtag relativo al termine "B-corp". Tale analisi è stata sviluppata attraverso l'utilizzo del software Nvivo. Il segnale attivato dagli stakeholder è invece stato analizzato attraverso le reazioni attivate dagli stakeholder apponendo un commento, un like/dis-like, o condividendo il post.

Dal punto di vista analitico, attraverso un approccio deduttivo, il totale dei post raccolti è stato codificato in nodi due principali categorie quali: (1) post con contenuto volutamente legato allo status di B-corp e (2) post non legato allo status B-corp. La scelta di includere un hashtag, infatti ha il potere di sintetizzare gli elementi essenziali che si vogliono trasmettere attraverso un post ed il framework comunicativo all'interno del quale si vuole inserire una determinata comunicazione.

Risultati. La ricerca condotta ha comportato l'analisi di oltre 6000 post pubblicati sui social Instagram e Facebook da parte di 14 aziende italiane BCorp operanti nel settore alimentare ed ufficialmente registrate sulla piattaforma istituzionale dell'iniziativa B-corp.

In linea generale emerge che le imprese pubblicano 2 volte di più sulla piattaforma facebook poiché consente di scrivere contenuti anche privi di immagini.

Il primo livello di analisi ha messo in luce che le imprese hanno rispettivamente pubblicato circa 300 post legati al concetto di b-corp tramite hashtag. Ovvero solo il 4% dei post rivolti agli stakeholder Facebook e il 5% dei post rivolti agli stakeholder instagram riguardano volutamente il tema bcorp.

La categorizzazione dei post secondo l'approccio deduttivo rispetto alle dimensioni bBcorp, ha consentito di mettere in luce una maggiore attenzione alla comunicazione delle tematiche ricadenti all'interno del tema b-corp "governance". Il 55% dei post contrassegnati dal #b-corp (e affini) riguarda infatti la dimensione della governance e dei suoi sotto-temi.

Il secondo aspetto B-corp principalmente trattato è quello degli impatti sulle comunità con il 21% dei contenuti focalizzato sul tema, l'8% riguarda gli impatti sull'ambiente. Il 14% dei post ha utilizzato la connessione al framework b-corp facendo riferimento di fatto a tematiche inerenti alle B-corp, ma non classificabili in modo certo ad una delle categorie individuate. Infine, in maniera equivalente, (ovvero attraverso lo 0,66% dei post per categoria) vengono trattate le categorie dei clienti, dei lavoratori e la trasparenza d'impresa.

Le analisi mostrano che alcune dimensioni B-corp non trovano spazio all'interno dei segnali inviati dalle imprese attraverso post pubblicati sui propri profili. Tale evidenza mostra che da parte delle imprese alcune tematiche B-corp non sono considerate utili per inviare un segnale circa la propria natura B-corp o che alcune tematiche B-corp non sono percepite come collegabili alla sfera B-corp.

Tra le aree non coperte in toto, e quindi non segnalate in alcun modo, vi è il sottotema "metriche di governance" che al suo interno copre gli aspetti relativi ai flussi finanziari di una impresa. In questo senso è possibile ipotizzare che la storica dicitura "reportistica non finanziaria" legata alla rendicontazione degli aspetti di sostenibilità abbia costituito un bias per le imprese che credono poco rilevante o elegante collegare la propria condotta di governance (di tipo B-corp) alle tematiche di tipo finanziario.

L'analisi dei post non b-corp, come descritto, ha visto un approfondimento dei contenuti trattati per identificare eventuali segnali di comunicazione relativa alle aree di impatto b-corp.

Solo l'1% dei post non contrassegnati con l'hashtag b-corp tratta temi b-corp. Seppur il numero sia basso e forse irrilevante (63 in totale) i temi presentati racchiudono alcuni dei principi fondanti della certificazione b-corp che, per questo, meriterebbero di essere valorizzati all'interno del giusto quadro.

Interessante è notare che alcuni aspetti scarsamente trattati o non trattati nei post Bcorp sono invece presenti all'interno di questo cluster di post. Diversamente, la dimensione della governance, largamente trattata nel cluster precedente, è praticamente assente in questa seconda fase analitica. In linea generale, ambiente, lavoratori e fornitori sono le aree di impatto verso cui le imprese hanno voluto trasmettere un più alto numero di segnali.

L'osservazione della comunicazione non istituzionale implementata attraverso canali social fornisce il vantaggio di capire quali elementi le imprese credono siano più interessanti per gli stakeholder e decidono quindi di comunicare. Rimane quindi da capire perché alcune dimensioni B-corp che portano ad un impegno importante da parte dell'impresa, non vengano poi comunicate o valorizzate attraverso i propri canali.

Limiti della ricerca. I limiti della ricerca presentata sono legati ad una analisi sviluppata attraverso la consultazione di sole due piattaforme social. I dati non sono quindi stati confrontati con eventuali bilanci di sostenibilità e/o di impatto. Tale limite, costituisce una scelta consapevole da parte delle ricercatrici che volevano fornire un focus sulla relazione costruita con lo stakeholder di massa piuttosto che su uno stakeholder di nicchia quale quello interessato alla comunicazione istituzionale contenuta all'interno di bilanci/report pubblicati in sezioni specifiche del sito web.

Il secondo limite è relativo all'assenza di un confronto diretto con le imprese coinvolte nello studio. Tale confronto potrebbe arricchire le chiavi di interpretazioni relative alle scelte di comunicare o non comunicare determinati temi.

Un altro limite della ricerca è legato al fatto che le attività di comunicazione sono sempre più spesso esternalizzate dall'impresa. Le competenze richieste per gestire un sistema di comunicazione multi-canale possono infatti non essere presenti all'interno di imprese che lavorano in settori differenti. In questo senso, la mancata inclusione di un hashtag può derivare anche da una non totale consapevolezza del mondo B-corp da parte di coloro che forniscono il servizio di comunicazione, piuttosto che da una scarsa consapevolezza dell'impresa stessa.

Implicazioni. Il contributo fornisce implicazioni relative alla necessità di diffondere maggiore consapevolezza interna rispetto a tutte le tematiche e aree coperte dall'essere certificati B-corp. In questo senso la scelta stessa del fornitore del servizio di comunicazione può essere orientata rispetto alla capacità dello stesso di segnalare in modo completo e valorizzare quali sono le implicazioni di una impresa che decide di certificarsi B-corp.

In secondo luogo, emerge il ruolo della comunicazione e della trasparenza. La ricerca evidenzia l'importanza della comunicazione aziendale e della trasparenza nei confronti degli stakeholder. Le imprese devono comunicare in modo chiaro e trasparente i propri sforzi in materia di sostenibilità, anche attraverso i canali social, per creare fiducia e coinvolgere i propri pubblici di riferimento.

In terzo luogo, l'analisi suggerisce una maggiore attenzione ai segnali inviati dagli stakeholder. L'analisi dei segnali inviati dalle imprese attraverso i canali di comunicazione, come i social media, fornisce insight preziosi per migliorare la comunicazione e individuare aree di sviluppo della certificazione B-Corp. Le imprese devono essere consapevoli dei messaggi che trasmettono e dell'efficacia della loro comunicazione sulla sostenibilità.

Infine, implicazioni si hanno rispetto all'evoluzione della certificazione B-Corp. L'evoluzione normativa ha portato l'organizzazione promotrice della certificazione B-Corp, B-Lab, a rivedere e migliorare i criteri di certificazione per allinearsi alle nuove leggi e alle aspettative degli stakeholder. Questo indica la necessità di un costante aggiornamento e miglioramento dei modelli di valutazione della sostenibilità.

Originalità del paper. Lo studio presenta quattro elementi di originalità. Primo il paper si distingue per il suo focus sull'impresa come principale soggetto della comunicazione, piuttosto che sugli stakeholder. Mentre molte ricerche si concentrano sull'interpretazione degli stakeholder dei segnali inviati dalle imprese, questo studio adotta un approccio inverso, osservando attentamente la strategia comunicativa delle aziende certificate B-Corp. Questo approccio insolito fornisce una nuova prospettiva sulla comunicazione aziendale e sull'efficacia dei messaggi trasmessi.

Secondo, un altro elemento di originalità è rappresentato dall'utilizzo dell'analisi qualitativa della comunicazione aziendale come strumento proxy per valutare potenziali miglioramenti nell'evoluzione della certificazione B-Corp. Piuttosto che concentrarsi esclusivamente sui risultati finanziari o sugli indicatori di sostenibilità, il paper esplora il contenuto e la strategia comunicativa delle imprese come indicatore di aderenza ai principi B-Corp. Questo approccio innovativo offre un metodo alternativo per valutare l'efficacia e l'accuratezza della comunicazione aziendale.

Terzo, il paper fornisce indicazioni chiare alle imprese di uno specifico settore su aree non trattate nella loro comunicazione, suggerendo potenziali miglioramenti per il futuro. Questo aspetto è particolarmente importante perché aiuta le imprese a identificare le lacune nella loro strategia comunicativa e a sviluppare piani più efficaci per comunicare il loro impegno per la sostenibilità. In questo modo, il paper offre un contributo tangibile al miglioramento della comunicazione aziendale e alla promozione della trasparenza e della responsabilità nel settore.

Infine, mentre molti studi si concentrano sugli effetti della certificazione B-Corp sulle prestazioni aziendali, questo paper si distingue per esaminare in dettaglio la comunicazione delle imprese subito dopo aver ottenuto la certificazione. Questo approccio fornisce una prospettiva preziosa su come le imprese intendono comunicare il loro impegno per la sostenibilità e le sfide incontrate durante la transizione verso un modello aziendale più responsabile.

Individuals' Goal Alignment in Humane Entrepreneurial Oriented Organisations: A Preliminary Study

CHIARA MARINELLI¹ GRAZIA GARLATTI COSTA² SALVATORE DORE³

Abstract

In the evolving economic landscape, firms must face challenges and opportunities concerning sustainability in its societal, environmental and economic dimensions. Additionally, strategic HR management plays a key role within organisations, underlining the importance of ensuring employees' engagement and their alignment with overarching corporate goals. By departing from goal framing theory and the humane entrepreneurship perspective, this study aims to preliminarily explore the relationship between goal alignment and humane entrepreneurship. Using data from an ongoing data collection conducted among Italian firms' employees, we use scales currently under testing and validation to check for a potential relationship between the two constructs. The preliminary results suggest a positive mutually reinforcing relationship between goal alignment and humane entrepreneurship. We highlight the need for further investigation on this relationship, to the benefit of a deeper understanding of short- and long-term social and corporate sustainability aspects. Ultimately, we draw relevant and inspiring implications for theory and practice of management, entrepreneurship and organisational strategy.

Keywords: Goal Alignment, Humane Entrepreneurship, Sustainability

Framing of the research. *In the evolving global economy, organisations face unprecedented challenges and opportunities. The shifting social conditions and employees' working needs make re-evaluations of traditional business models and strategies necessary (Venkatesh & Speier, 2000). On the one hand, ensuring individual employees' objectives are aligned with the higher-level firms' goals is fundamental to strategic agility and corporate performance (Santos, 2012). On the other, prioritising ethical considerations, personnel's welfare, and social impact alongside profitability are key to demonstrating organisational commitment and engagement in human entrepreneurial aspects (Kim et al., 2021b). The emphasis on joint goals and appropriateness standards, proper of normative goal alignment, encourages employees' willingness to attain corporate objectives thanks to feelings of identification and collective share. Corporate humane entrepreneurship actions, in turn, can further reinforce individuals' engagement, their organisational identification and their alignment to higher-level objectives (Foss & Lindenberg, 2012). Therefore, exploring the relationship between goal alignment and sustainability-oriented entrepreneurial actions appears relevant to the current business scenario.*

Goal framing theory and goal alignment

Firstly, aligning individual employees' goals with the overarching corporate objectives is a critical determinant of organisational performance and competitive advantage (Lindenberg & Foss, 2011). In the context of goal orientation and strategic alignment, the goal framing theory explores how the frame of objectives and social, environmental variables affect people's perceptions, attitudes, and behaviours (Birkinshaw et al., 2014; Lindenberg & Steg, 2013). Indeed, the theory forecasts three overarching objectives: normative, gain, and hedonic goal frames. Scholars suggest normative goals harmonise with the corporate organisational, market, and strategic objectives, whereas hedonic and gain goals prioritise individual interests. While the hedonic category remarks the importance of personal and professional growth, gain goals emphasise individual well-being, encompassing a balanced work-life dynamic and satisfactory compensation in return for employment (Foss & Lindenberg, 2013; Lindenberg & Foss, 2011).

The most important aspect of the alignment between individual and corporate objectives is the concept of normative goals, which implies employees have incentives to act in line with established standards and codes of conduct within their companies while accomplishing specific tasks or goals (Lindenberg & Steg, 2007). Employees' normative objectives are

³ University of Trieste
e-mail: salvatore.dore@amm.units.it

essential for the development of an organisational culture that is respectful of workers, allows their growth, and promotes a corporate idea of business ethics (Treviño & Nelson, 2016).

Moreover, in line with social identity theory, the goal framing theory maintains the normative goal is characterised by collective identification and the eagerness to act appropriately to the benefit of a supra-individual entity, such as the team or the organisation (Van Knippenberg, 2000). Scholars highlight how normative goal alignment contributes to the harmonisation of the goals of managers and employees with the firm's strategic imperatives, fostering a cohesive organisational culture where human and social capital can thrive (Buller & McEvoy, 2012). In turn, strategic management and human resource literature acknowledge employees' alignment with firms' goals is pivotal to the development of organisational capabilities and corporate performance, as well as to the growth of individuals' skills, motivations, and opportunities (Foss & Lindenberg, 2012). However, the transition from organisational goals into tangible results requires employees both understand firms' objectives and appreciate the actions and measures that are conducted to fulfil the corporate strategy (Boswell et al., 2006).

Therefore, we advocate goal alignment can be encouraged and reinforced among normatively goal-aligned employees thanks to human-oriented measures and policies fostering their engagement, development and well-being (Alagaraja & Shuck, 2015). Actions in favour of people's well-being can be interpreted in a broader sense, encompassing communities' and environments' aspects along with economic ones. By adopting a comprehensive idea of corporate sustainability, promoting the congruence between employees' and organisational strategic goals underscores the critical importance of human resources as a strategic asset for value creation and long-term growth (Guest, 1997; Ribeiro & Gomes, 2016). In turn, the matching between human resources and organisational goals has the potential to foster corporate effectiveness and firms' performance, leading companies to higher competitive advantage (Guest, 2011; Wood, 1999). All in all, academic literature and business practice show corporate goals are increasingly tied to a more comprehensive concept of firm, where economic profits, human well-being and sustainability are recognized as increasingly intertwined (Muñoz & Dimov, 2015). This has led to the foundation of a new concept incorporating these aspects, namely humane entrepreneurship.

Humane entrepreneurship: a new, multifaceted concept

Humane entrepreneurship has emerged as a notion integrating business and human aspects within organisational boundaries (Kim et al., 2021a). The concept integrates the entrepreneurial orientation with an ethical approach, emphasizing the importance of communities' and environment's well-being in addition to economic aspects. Scholars define humane entrepreneurship as an entrepreneurial approach prioritizing human welfare and ethical considerations, leading to sustainable and socially responsible business practices (Kim et al., 2018; Parente et al., 2018). This approach challenges traditional business paradigms by advocating for a balance between profit generation and social responsibility (Parente & Kim, 2021).

The theoretical underpinnings of humane entrepreneurship draw from various disciplines, including business ethics, corporate social responsibility (CSR), and social entrepreneurship, along with the key concept of the creation of shared value (CSV) (Porter & Kramer, 2011; Santos, 2012). These perspectives reinforce the idea entrepreneurial ventures can operate for the greater good, thus emphasizing a humane approach benefits society and contributes to firms' competitive advantage (Vesci et al., 2021).

Empirical studies on humane entrepreneurship demonstrate its positive impact on various organisational outputs, including employee satisfaction, innovation, and financial performance (DiVito & Ingen-Housz, 2019; Kim et al., 2021b). For instance, scholars highlight how companies that invest in employee well-being and ethical practices tend to outperform their peers in the long run, which suggests a positive relationship between humane practices and corporate success. Similarly, organisations incorporating social and environmental considerations into their strategies are more likely to be sustainable and resilient (Le, 2022).

Although conceptualizations of humane entrepreneurship may not entirely coincide among scholars, its three main dimensions have been identified as the individual perceptions of entrepreneurship, sustainability, and human orientation (Parente et al., 2018). First, the individual perception of entrepreneurial orientation (IEO) reflects a person's inclination towards innovation, risk-taking, and proactiveness in identifying and exploiting opportunities, which puts into evidence the role of personal values and attitudes in shaping entrepreneurial ventures that are not only innovative but also ethically grounded (Lumpkin & Dess, 1996). Conversely, the individual perception of sustainability orientation (ISO) highlights a commitment to long-term ecological and societal well-being, thus integrating economic, environmental, and social goals for sustainable development (Parente et al., 2018; Schaltegger & Wagner, 2011). Indeed, sustainability-oriented businesses adopt holistic approaches to address societal challenges, demonstrating the potential of humane entrepreneurship to drive positive change in society (Stubbs & Cocklin, 2008). Lastly, the concept of the individual perceptions of human orientation (IHO) includes the emphasis placed on human values, well-being, and ethical treatment of all stakeholders (Kim et al., 2018). Pirson (2017) highlights the significance of IHO for current business activities, as this dimension is foundational to creating organisations excellent on both economic performance and human dignity, equality and social justice.

By integrating these three aspects of sustainability, i.e., IEO, ISO, and IHO, humane entrepreneurship offers the possibility of a comprehensive framework for understanding current entrepreneurial practice and foster growth. The balanced consideration of these aspects allows for harmonious integration of innovation, commitment to environmental sustainability, and dedication to human values and socially oriented actions among corporate goals addressing firms' competitiveness (Kim et al., 2021a).

Therefore, humane entrepreneurship actions are meant to create benefits to communities both internally and externally, employees and stakeholders included (Parente & Kim, 2021). As employees' involvement and identification with organisational goals are key to their goal alignment with firms strategies, measures undertaken to enhance an all-encompassing sustainability idea and meant to people's well-being reinforce workers' commitment to corporate objectives. The more people are normatively aligned to corporate goals, the more their alignment will be strengthened by the presence of humane entrepreneurship initiatives. In a reciprocal manner, more humane-entrepreneurship oriented actions will foster employees' appreciation of the firm, thereby fostering corporate goal alignment in a positive, mutually reinforcing loop. Consequently, the synergy among these dimensions shows high potential to enhance economic success and positively contribute to the society and the environment.

Overall, scholars suggest aligning employees' objectives with organisational goals optimizes corporate performance and sustainability and eases the development of a culture of empowerment, recognition, and personal development, which are key to humane entrepreneurship (Boswell et al., 2006). Therefore, by integrating emerging studies on corporate goal alignment and humane entrepreneurship, we suggest a mutually supportive relationship between the two concepts, where the former facilitates an organisational culture oriented to the latter, which in turn reinforces employees' commitment to fulfilling firms' objectives.

Purpose of the paper. The potential synergy between goal alignment and humane entrepreneurship offers a promising avenue for organisations to enhance their performance and their positive societal contribution. Nevertheless, these two concepts still lack adequate tools of evaluation and measurement. In the current understanding of goal alignment, grounded on goal framing theory, we miss an adequate tool of evaluation for the assessment of normatively goal aligned employees. Moreover, the lack of an accepted framework for implementing humane entrepreneurship practices poses a challenge for organisations seeking to adopt this approach (Dębicka et al., 2021). Additionally, despite ongoing academic debate, neither do scholars agree on a unique assessment tool for humane entrepreneurship, nor does a comprehensive instrument exist yet (Parente et al., 2020).

Therefore, this paper aims to explore the significance of the relationship between goal alignment and humane entrepreneurship, arguing it is essential for employees' supportive organisational cultures and performance. By integrating insights from the goal-framing literature, strategic management and organisational studies, we highlight the potential for academic theory and managerial practice of exploring the relationship between corporate goal alignment and humane principles, by also hinting at the main benefits of their synergy on human and financial aspects (Porter & Kramer, 2011).

In short, this preliminary study aims to shed light on the interlocutory relationship between goal alignment and humane entrepreneurship by also proposing for them new measurement scales, which are currently under testing and validation. In line with current literature, we expect firms that maintain a normative goal aligned organisational culture supported by humane entrepreneurship principles and practices are better equipped to obtain financial success and meaningfully contribute to societal well-being and environmental sustainability (Bocken et al., 2014).

In doing so, this paper enriches the debate on the role of humane entrepreneurial practices and strategic goal alignment in business strategy, offering new academic research avenues and practical insights for academics and leaders seeking to build more ethical, innovative, and resilient organisations in an era of global challenges and opportunities.

Methodology. The paper is grounded on a wider data collection involving 7 companies placed in the North-East of Italy. The sample of firms participating in the survey belong to different industry sectors and are of high dimensions (more than 250 employees). The data collection started at the beginning of 2024 and is currently ongoing.

Surveys are emailed to firms' employees mostly through their respective human resource managers. Managers are charged with forwarding the questionnaires links to their employees, and surveys were progressively closed around two weeks later. Therefore, we limit the present study to 3 firms that reached the target number of employees by mid-February 2024, for a sample of 744 workers.

The complete survey comprises more than 20 constructs of interest, for more than 50 items overall. The survey text was first elaborated in English and translated into Italian, following a back-to-back translation procedure as indicated by Brislin (1986). The variables included in the study pertain to individual perceptions of the work environment and individual working conditions, such as the perceived company's technology readiness, the implementation of agile working methods or creative behaviour. For the purposes of our research, however, we consider the following constructs.

Individual Perception of Entrepreneurial Orientation (IEO)

The scale measuring this first dimension of humane entrepreneurship is elaborated from the paper by Hansen et al. (2011), comprising six items evaluated on a seven-point Likert scale. The sentences pertain to new services or products launched or renewed by the company during the last three years, as well as to the entrepreneurial orientation and beliefs of higher-level managers and directors or the overall firm response to competitiveness.

Individual Perception of Sustainability Orientation (ISO)

The survey questions pertaining to ISO are drawn from Muñoz and Dimov (2015). Participants are asked to express their degree of agreement or disagreement on four sentences on a seven-point Likert scale, ranging from 1= strongly disagree to 7= strongly agree. Specifically, the items investigate firms' availability and willingness to adopt measures and implement actions to the benefit of their communities, the environment and a parsimonious use of resources.

Individual Perception of Human Orientation (IHO)

The construct is evaluated thanks to an adapted version of the scale from the article by Kim et al. (2018), which comprises four questions on a seven-point Likert scale. Participants are required to express their rate of agreement on statements regarding their perceptions of inclusion, non-discrimination and empathy by the firm managers. An example of sentence is 'The managers of the company I work for support people in their skills development' or 'The managers of the company I work for do not discriminate any individual'.

Goal alignment

In order to assess employees' alignment with corporate goals, participants are given six sentences with six objectives indicated by capital letters, two-by-two corresponding to normative, gain and hedonic overarching goals as according to the classification indicated by Foss & Lindenberg (2013). Then, participants are instructed to reorder the six goals from the most important to the least relevant to them, by writing down the order of the letters. Some examples of the goals are 'Work with people and having good social contact with co-workers' (hedonic), 'Having growth and career opportunities' (gain) and 'To reach my firm's objectives' (normative). Scores are assigned to each participant on the basis of the first two objectives present in their lists, where 0 means no normative goal in the first two positions, 1 stands for a normative goal in the second place, 2 indicates a normative goal in the first place and 3 both normative goals ranking first and second.

Control variables

We include as control variables participants' gender, age, level of education and caregiving responsibilities with respect to children or parents. As for work-related control variables, we ask participants' level of seniority within the company, their job position and type of contract.

Results. Preliminary analyses were conducted on a sample of 744 employees. Among the participants, 398 are men. Most people hold a high school diploma (57.5%), followed by those with a bachelor's or master's degree (30.8%). Moreover, an overwhelming majority (718 employees) hold a long-term contract and are between 39 and 54 years old (37.8%). Around 30% of the sample comprises executive staff and minor managerial figures, such as business unit representatives or heads of functions.

Since the constructs under examination are still under-explored by current literature and lack homogeneous and validated measurement tools, we undertook first exploratory and confirmatory factor analyses to find some preliminary confirmation of the validity of our scales. Although these analyses are still ongoing, the preliminary results provide some confirmation of the consistency of our operationalization of these variables.

After conducting the preliminary analyses and descriptives sample statistics, we plotted a Pearson correlation matrix showing the linear relationship among the variables of our interest. The results can be seen in Table 1.

Table 1. Correlation matrix coefficients for IEO, ISO, IHO and goal alignment. ** stands for $p < 0.001$. Source: the authors.

	IEO	ISO	IHO	GOAL ALIGNMENT
IEO	1	0.45**	0.39**	0.12**
ISO	0.45**	1	0.63**	0.16**
IHO	0.39**	0.63**	1	0.21**
GOAL ALIGNMENT	0.12**	0.16**	0.21**	1

First, we considered the bilateral relationships among the three dimensions of humane entrepreneurship and goal alignment. The correlation matrix reveals that the IEO, ISO and IHO dimensions show some degree of correlation one with the other, but their coefficients seem to suggest no multicollinearity risks as they are all below the 0.7 threshold. As for the relationship between the three separate dimensions of humane entrepreneurship and goal alignment, the Pearson correlation coefficients seem to suggest there is a mild to low linear relation between them, in a positive direction. Coefficients are all significant at 0.001.

At the subsequent stage, we aggregated the three humane entrepreneurship dimensions and considered them as a unique variable, namely humane entrepreneurship. The Cronbach's alpha for this scale is 0.74, which can be considered acceptable for an exploratory study of a scale that is not established yet. The corrected item-total correlation also shows values above 0.3, indicating no major issues within the item-total statistics.

Table 2 shows the results of the Pearson correlation between goal alignment and humane entrepreneurship.

Table 2. Correlation matrix coefficients for goal alignment and humane entrepreneurship. ** stands for $p < 0.001$. Source: the authors.

	GOAL ALIGNMENT	HUMANE ENTREPRENEURSHIP
GOAL ALIGNMENT	1	0.205**
HUMANE ENTREPRENEURSHIP	0.205**	1

Also in this case, we highlight the correlation between the two variables (goal alignment and humane entrepreneurship) is positive and significant ($p < 0.001$), although the magnitude of the coefficient suggests a mild relationship between the two constructs.

Consequently, based on the above-mentioned literature framework and evidence from current practice, we interpret our preliminary results as encouraging to deepen the relationship between the two variables. As these are pure

correlations, we are interested in moving further and exploring the role played by other intervening variables that could provide us with a refined understanding of the relationship between goal alignment and humane entrepreneurship. Among these variables, we think a promising explanatory role could be covered by variables pertaining to individual perceptions of corporate aspects (of innovative working practices, of technological invasion and so forth) or to personal conditions on the workplace (such as job autonomy).

It is also plausible that, with a different sample of employees, we could obtain diverse results in the direction of a stronger relationship between goal alignment and humane entrepreneurship. Importantly, the elaboration of the measurement scales needs to undergo further trials and refinement efforts, in order to improve the validity of these research assessment tools. Nevertheless, the preliminary results of the present paper seem to suggest that moving forward and better exploring the mechanisms and the intertwined dynamics of goal alignment and humane entrepreneurship could be a promising avenue for future research studies and for business practice.

Research limitations. The main limitation of the study pertains to the cross-sectional design of the survey, which does not allow us to assert causal linkages among the variables of interest. Moreover, we underline the fact that we rely on self-reported measures by participants, with the risk of common method bias. Despite adopting design precautions during the survey elaboration, this potential risk must nevertheless be reported.

In addition, we point out the limited geographic scope of our research, which hinders generalisability of our findings. We also warn that the differences among the firms of our sample in terms of employees' sample sizes, business unit groupings and other factors hinder any intra-group comparisons, suggesting it is better to consider data per company in aggregate terms.

Lastly, we remark that we make use of new scales that have undergone preliminary exploratory and confirmatory factor analyses, which deserve and are in need for further testing and refinement. Therefore, results are far from conclusive, as the measurement tools themselves are not entirely finalised.

Managerial implications. The findings of this study offer significant insights into the synergy between goal alignment and humane entrepreneurship, presenting valuable implications for managers and entrepreneurs striving to foster innovative, sustainable, and socially responsible business environments.

Firstly, our preliminary results encourage managers to take actions to align organisational objectives with humane entrepreneurship aspects, by incorporating social, ethical, and environmental considerations within firms' goals. This means cultivating a corporate culture which reinforces long-term commitment to sustainable outcomes. Therefore, organisations are encouraged to involve their employees and value their contribution to achieve corporate objectives, which may lead to higher motivation, creativity, and loyalty. To this end, training and development programs that promote these values and enable employees to actively contribute to humane-oriented corporate actions may be useful. In a positive mutually reinforcing cycle, this may strengthen employees' sense of belonging and commitment to organisational goals. We show that companies have the possibility to integrate economic objectives with corporate sustainability goals, to the benefit of their employees' well-being.

Secondly, the study implications extend beyond internal organisational management and underline the importance of fostering a humane entrepreneurship image to cater to a wider public of stakeholders. Beyond employees, public commitment to sustainable objectives may translate in higher involvement of customers, investors, and partners who share similar values. Therefore, companies adopting corporate practices in the direction of humane entrepreneurship have the potential to attract socially conscious investments and foster collaborative partnerships benefitting corporate sustainable growth.

Thirdly, preliminary research in the field highlights the need for firms' policies and governance structures that support organisational cultures of employees' alignment to corporate goals. Apart from economic benefits, leaders should enhance and implement policies that promote ethical business practices, social responsibility and environment-friendly actions, paying attention to ensure the pursuit of business goals matches with humane exigencies.

Lastly, this preliminary study results seems to suggest businesses demonstrating a strong commitment to humane entrepreneurship actions are more likely to be innovative and adaptable. This approach may be beneficial to effectively address societal, environmental and economic challenges, thus opening up new growth and employees' development opportunities.

Originality of the paper. Thanks to our paper, we provide a new and interesting perspective on the integration of goal-framing theory with humane entrepreneurship, suggesting a mutually reinforcing relationship between a cohesive and strategically aligned organisational culture and humane entrepreneurial practices. The originality of this research lies in its comprehensive standpoint which integrates insights from organisational behaviour, strategic management and entrepreneurship, delving into how individuals' and organisational goals can align to the benefit of economic, societal and environmental sustainability. The study also remarks the importance of adopting humane entrepreneurial measures, in order to enhance both people's well-being and corporate performance.

The present investigation stands out for its multi-dimensional analysis of goal alignment and humane entrepreneurship processes, offering a novel perspective on the mechanisms through which employees' commitment and engagement with corporate objectives can be maximised. Contextually, we present scales currently under testing and in need for further validation on goal alignment and humane entrepreneurship, which are new concepts still in need of adequate measurement tools currently missing in present literature. We also show the first results of an ongoing study

including these measurement scales, which are among the first operationalisations of the humane entrepreneurship and goal alignment constructs. By doing this, we hope to encourage further academic contributions in the field.

Lastly, the preliminary findings of this study offer a valuable perspective to organisational and management studies, underscoring the potential of the synergy between goal alignment and humane entrepreneurship to both individual and corporate success. In the end, we hope to stimulate further research on the evolving dynamics between goal alignment and humane entrepreneurship within diverse organisational contexts and over time.

Open Social Innovation per affrontare le sfide globali: il caso Isinnova

VALENTINA CUCINO¹ ROSANGELA FEOLA² GIULIO FERRIGNO³

Abstract

Questo articolo esplora il concetto di innovazione sociale aperta come approccio fondamentale per affrontare sfide sociali importanti come il cambiamento climatico, le pandemie e le disuguaglianze. Questo modello promuove la collaborazione tra cittadini, società civile, organizzazioni del settore privato, istituzioni e pubblica amministrazione per affrontare collettivamente le sfide, dall'identificazione dei problemi alla scala delle soluzioni innovative. L'apertura di questo processo favorisce lo sviluppo e il miglioramento delle soluzioni, facilita un apprendimento rapido attraverso contesti sociali diversificati e genera impatti positivi sulla società. Lo sforzo collettivo orchestrato dell'innovazione sociale aperta aiuta a conciliare le incertezze associate alla complessa natura delle sfide sociali. Sottolineando la necessità di azioni collettive e sforzi imprenditoriali che coinvolgano diverse parti interessate, gli autori indagano su come le pratiche di innovazione aperta possano essere adattate con una prospettiva sociale. Più specificamente, partendo dall'analisi delle pratiche classiche di innovazione aperta definite dalla letteratura sul tema, lo scopo del paper è quello di analizzare le caratteristiche specifiche delle pratiche di innovazione sociale aperta mettendo in evidenza la loro configurazione specifica in un contesto sociale. Il paper contribuisce sia dal punto di vista teorico che pratico. Dal punto di vista teorico, il paper contribuisce alla recente letteratura sulle innovazioni sociali aperte attraverso l'identificazione e la caratterizzazione delle pratiche di innovazione sociale aperta. Dal punto di vista pratico, il paper fornisce utili spunti per manager e decisori politici al fine di definire strategie e politiche volte ad affrontare le sfide sociali adottando un approccio di innovazione aperta.

Key words: *open social innovation; open innovation; innovazioni sociali; sfide sociali*

Impostazione della ricerca *Affrontare importanti sfide sociali come il cambiamento climatico, le pandemie o le disuguaglianze richiede azioni collettive e sforzi imprenditoriali che coinvolgano cittadini, governi, istituzioni e organizzazioni non governative (Chesbrough, 2020; Markman et al., 2019; Seelos et al., 2023). In questo contesto, emerge il concetto di open social innovation come un paradigma di notevole rilevanza nell'affrontare le sfide sociali, in quanto si tratta di una pratica che promuove il coinvolgimento di attori diversi nei processi di innovazione (Bogers et al., 2020; Chesbrough & Di Minin, 2014; McGahan et al., 2021). L'apertura ai processi di innovazione sociale richiede infatti che manager e imprenditori incoraggino e coordinino la partecipazione di molteplici stakeholder (Chesbrough & Di Minin, 2014; Cucino, 2023; Mair et al., 2022, 2023). In altre parole, l'innovazione sociale aperta incoraggia la collaborazione tra attori di diverse origini per trovare soluzioni innovative ai problemi sociali (Bertello et al., 2022; Mair et al., 2022; Mair & Gegenhuber, 2021). Secondo questo paradigma, cittadini, società civile, organizzazioni del settore privato, istituzioni e pubblica amministrazione lavorano insieme in un'azione collettiva lungo l'intero processo di innovazione: dall'identificazione delle sfide alla generazione di idee per affrontarle, e infine, alla scala di queste soluzioni (Cucino, 2023; Vesci et al., 2021).*

La ricerca ha mostrato come l'open social innovation offre molti benefici tra i diversi attori coinvolti nel processo di innovazione sociale (Bertello et al., 2022; Bogers et al., 2020; Chesbrough & Di Minin, 2014; Mair et al., 2022). In primo luogo, il processo di interazione promuove lo sviluppo di nuove soluzioni o il potenziamento di quelle esistenti (Chesbrough & Di Minin, 2014). In secondo luogo, basandosi su una comprensione condivisa del problema, attori provenienti da contesti sociali diversi (ad esempio, amministrazione pubblica o innovatori della società civile) possono imparare insieme e superare più rapidamente le sfide sociali (Bertello et al., 2022; Mair et al., 2022). Inoltre, il paradigma dell'open social innovation non solo consente lo sviluppo e l'attuazione di soluzioni innovative, ma avvia anche un processo di apprendimento capace di generare un impatto sociale positivo (Bogers et al., 2020; Mair et al., 2022). Inoltre, avvicinandosi all'innovazione sociale aperta come uno sforzo collettivo orchestrato aiuta a conciliare le incertezze associate alla natura complessa e sistemica delle sfide sociali (Hargrave & Van De Ven, 2006; Markman et al., 2019; Mair & Seelos, 2017).

e-mail: giulio.ferrigno@santannapisa.it

Tuttavia, nonostante l'interesse recente e crescente sul potenziale dell'innovazione aperta per affrontare le sfide sociali (Gegenhuber e Mair, 2024), poco è stato esplorato su come le pratiche di open social innovation generino impatto sociale. Comprendere questa questione implica inevitabilmente che i ricercatori debbano considerare tutti gli stakeholder coinvolti, nonché le iniziative - costellazioni di problemi, soluzioni e attori - che emergono dal processo di innovazione sociale basato sull'azione collettiva (Giones et al., 2020; Muñoz et al., 2020; Vanderhoven et al., 2020).

Obiettivo del paper. Per far progredire la comprensione teorica dell'open social innovation, gli autori declinano l'open social innovation come fenomeno multi-stakeholder basato sull'azione collettiva e sforzi imprenditoriali che coinvolgono diverse parti interessate. Come tale, esplorano come le pratiche di open innovation possano essere adattate con una prospettiva sociale. In questo contesto, partendo dall'analisi delle pratiche classiche di innovazione aperta definite dalla letteratura sul tema (Ferrigno et al., 2022, Spithoven et al., 2013) gli autori analizzano le caratteristiche specifiche delle pratiche di open social innovation mettendo in evidenza la loro configurazione specifica in un contesto di livello sociale.

Più specificamente, gli autori avanzano le seguenti domande di ricerca: Come possono essere caratterizzate le pratiche di open social innovation in un contesto sociale per affrontare le sfide sociali? Come cambiano le pratiche tradizionali di innovazione aperta in un contesto multi-stakeholder in cui diversi attori provenienti da vari settori lavorano insieme in un'azione collettiva lungo il processo di innovazione sociale?

Metodologia della ricerca. Per rispondere alla domanda di ricerca dello studio, gli autori conducono un'analisi qualitativa completa di un caso studio di spicco di innovazione sociale aperta. Più specificamente, gli autori analizzano l'open social innovation generata da Isinnova, una società di consulenza e ricerca italiana specializzata in innovazione e sviluppo sostenibile che è stata globalmente riconosciuta come un caso di innovazione sociale di grande successo durante la crisi pandemica. L'analisi qualitativa è radicata su una vasta quantità di interviste, osservazioni, dati archivistici con Isinnova e la moltitudine di stakeholder coinvolti nel suo processo di innovazione sociale aperta.

Le informazioni sono state raccolte attraverso sei interviste dirette al team di Isinnova e ad altri stakeholder coinvolti nel processo di ricerca e sviluppo, triangolate con altre fonti di dati (Gibbert et al., 2008), come l'analisi di documenti archiviati, siti web, documentari e interviste video. I dati sui processi innovativi dell'azienda sono stati raccolti in più fasi tra il 24 aprile 2020 e marzo 2023.

Le interviste sono state selezionate utilizzando una strategia di "snowball sampling" (Patton, 1990). Le interviste sono state condotte in italiano tramite Skype e telefono cellulare, registrate e successivamente trascritte. Le interviste si sono concentrate sul processo di innovazione e sul ruolo di tutti gli attori coinvolti nello sviluppo dei nuovi prodotti.

Per quanto riguarda il protocollo di intervista, questo studio ha utilizzato una combinazione di approcci intervistativi di storia di vita (Atkinson, 1998, 2002) e interviste fenomenologiche (Thompson et al., 1989). Non sono stati utilizzati script predefiniti, consentendo alle domande di fluire naturalmente durante la conversazione, mirando ad acquisire la descrizione e l'interpretazione dell'evento di ricerca e sviluppo da parte del partecipante. L'adozione di interviste sulla storia di vita è un modo per sia l'intervistatore che il rispondente di "costruire insieme narrazione e significato" e quindi "rendere significativi eventi ed esperienze" (Riessman, 2008, p. 23), essendo partecipanti attivi nella narrazione. In questo senso, ogni partecipante ha raccontato le proprie storie in modi diversi, offrendo l'opportunità di esplorare in profondità il processo di innovazione sociale aperta e gli elementi che caratterizzano le pratiche di innovazione aperta applicate durante il processo.

I dati raccolti sono stati esaminati ed interpretati attraverso la tecnica dell'analisi del contenuto qualitativo, secondo il metodo proposto da Gioia et al. (2013). L'analisi del contenuto consente di interpretare i dati attraverso un processo in cui le interviste trascritte sono considerate come unità di analisi e vengono interpretate dai ricercatori. Il processo interpretativo richiesto non è strutturato né codificato. Pertanto, è necessario integrare questa tecnica con i criteri posti dalla metodologia di Gioia.

Secondo questi criteri, gli autori hanno analizzato individualmente le interviste al fine di identificare i principali temi emergenti e derivare i concetti di primo ordine. Quindi, a partire dalla multipla identificazione dei concetti di primo ordine, tutti gli autori hanno discusso e confrontato i loro schemi di codifica, per ottenere uno schema di primo ordine condiviso e unico.

Successivamente, gli autori hanno effettuato un'analisi di secondo ordine per identificare nuove categorie concettuali (temi di secondo ordine), ottenute dall'aggregazione "semantica" dei concetti di primo ordine. In questo passaggio, il processo iterativo tra teoria ed evidenza ha portato all'identificazione di alcune caratteristiche distintive delle pratiche di innovazione aperta in contesto sociale.

Infine, i temi di secondo ordine sono stati aggregati in dimensioni teoriche, a partire dall'identificazione di unità minime di significato dalle sotto-categorie di concetti identificate nel passaggio precedente.

Risultati. I nostri risultati hanno rivelato che l'adozione di pratiche di innovazione sociale aperta può essere estremamente vantaggiosa per affrontare le complesse problematiche che affliggono le società contemporanee.

In particolare, gli autori hanno identificato come le quattro pratiche chiave dell'open innovation si modificano in chiave sociale per perseguire soluzioni innovative per le sfide sociali.

Prima di tutto, le analisi hanno mostrato come durante periodi di crisi, come nel caso delle pandemie, la ricerca di informazioni esterne e fonti di innovazione diventa decentralizzata. Questo processo coinvolge non solo singoli attori, ma anche una vasta rete di stakeholder, promuovendo un approccio collaborativo e inclusivo alla risoluzione dei problemi (Chesbrough and Di Minin, 2014; Mair et al., 2023).

In secondo luogo, le analisi hanno mostrato l'importanza della flessibilità nell'utilizzo delle risorse esistenti e delle innovazioni. Durante periodi di crisi, l'agilità e la capacità di adattamento (Vesci et al., 2021; von Hippel, 1986) diventano fondamentali per rispondere prontamente alle esigenze emergenti e sfruttare al meglio le risorse disponibili.

Un'altra pratica chiave che viene modificata è la co-creazione di valore con le comunità. In questo contesto, il coinvolgimento attivo dei partner diventa essenziale per affrontare le sfide sociali in modo efficace. La collaborazione con una vasta gamma di attori, inclusi cittadini, organizzazioni non governative e settore privato, consente di sviluppare soluzioni innovative che rispondono alle esigenze reali della società.

Infine, le analisi evidenziano l'importanza di combinare i diritti di proprietà intellettuale con sistemi open source. Mentre la protezione della proprietà intellettuale può essere importante per garantire il successo e la sostenibilità delle innovazioni, abbiamo osservato che in certi contesti, come quello delle sfide sociali, il profitto economico può essere sacrificato a favore della risoluzione delle problematiche sociali (Cucino et al., 2023; Ferrigno and Cucino, 2021). Questo approccio mira a garantire che le soluzioni innovative siano accessibili e utilizzabili da un'ampia gamma di attori, riducendo al minimo il rischio di speculazioni e garantendo un impatto sociale positivo a lungo termine.

Complessivamente, i risultati confermano l'importanza e la rilevanza dell'open social innovation nel contesto delle sfide sociali. Queste pratiche non solo offrono soluzioni concrete ai problemi esistenti, ma promuovono anche la collaborazione, l'inclusione e la sostenibilità, contribuendo così a costruire una società più equa e resiliente.

Limiti della ricerca. *Nel delineare i limiti della ricerca, è essenziale considerare diversi aspetti che potrebbero influenzare la sua portata e la sua validità. In primo luogo, va sottolineata la questione della generalizzabilità dei risultati. Poiché gli autori si sono concentrati su un singolo caso studio, quello di Isinnova durante la pandemia da COVID-19, potrebbe esserci una limitazione nella capacità di estendere le conclusioni ad altri contesti con sfide sociali diverse e ambienti culturali variabili.*

Un altro punto da considerare riguarda il rischio di bias derivante dalla natura stessa di un caso studio, che potrebbe introdurre soggettività nell'interpretazione dei dati. È possibile che gli intervistati abbiano una visione limitata delle attività di Isinnova, influenzando così la rappresentazione dei processi di innovazione sociale aperta.

Inoltre, sebbene gli autori abbiano esaminato dettagliatamente il processo di open social innovation di Isinnova, non viene fatta un'analisi specifica sull'impatto sociale delle soluzioni sviluppate. Questo potrebbe rappresentare un limite nella valutazione degli effetti reali delle pratiche di innovazione sociale aperta sulle comunità e sulla società nel suo complesso. In conclusione, affrontare questi limiti potrebbe arricchire ulteriormente la nostra comprensione dell'innovazione sociale aperta e del suo impatto sulle sfide sociali, consentendo una prospettiva più approfondita e completa sull'argomento.

Implicazioni manageriali *Ci sono almeno cinque lezioni pratiche da trarre dal caso di Isinnova in una situazione di sfida globale come la pandemia da Covid-19, le quali possono rivelarsi preziose per affrontare future crisi. In primo luogo, l'innovazione sociale aperta ha mobilitato le conoscenze di un vasto esercito volontario di attori provenienti da vari settori, discipline, luoghi e campi, promuovendo l'apprendimento e accelerando il progresso contro la malattia. In un contesto di emergenza futura, un approccio aperto si rivela l'unica via per abbracciare rapidamente e proattivamente gli stimoli all'innovazione generati da una crisi.*

In secondo luogo, il successo di un'azienda dipende dalla scelta dei partner giusti e dalla corretta combinazione di competenze interdisciplinari. I numerosi partner con cui Isinnova ha collaborato sono stati un elemento fondamentale per la creazione e, soprattutto, la diffusione dell'innovazione. Questa esperienza dimostra che, in un contesto di crisi, collaborare con i partner adeguati è più critico che mai per accedere alle conoscenze necessarie e sviluppare rapidamente nuove innovazioni.

In terzo luogo, il concetto di brevetto non riguarda esclusivamente il profitto economico. In situazioni di grave emergenza, i profitti finanziari devono essere messi da parte poiché altre necessità, come il contributo alla comunità, assumono la massima priorità. Isinnova ha reso disponibili i propri progetti come open source per garantire che la sua innovazione potesse raggiungere il maggior numero possibile di operatori, consentendo la produzione di valvole non solo in Italia, ma anche all'estero. Le aziende devono pertanto valutare attentamente le pratiche di protezione della proprietà intellettuale, riconoscendo che il brevetto è uno strumento per proteggersi da possibili abusi da parte di terzi, ma non rappresenta necessariamente il mezzo principale per trarre profitto da una propria invenzione.

In quarto luogo, la mobilitazione di attori e risorse è un fattore chiave nel gestire situazioni di crisi e offrire soluzioni innovative efficaci e ad alto impatto. È infatti attraverso un appello sul proprio sito web che l'azione benefica di Isinnova ha ottenuto risonanza mediatica e ha coinvolto il maggior numero possibile di attori per affrontare l'emergenza da Covid-19. Le aziende devono pertanto considerare che, in situazioni di crisi, gli attori che compongono il sistema economico di un paese sono più sensibili alle esigenze della società e si mobilitano per affrontare questa necessità urgente.

Infine, tralasciando i casi piuttosto rari in cui l'innovazione sociale è guidata da organizzazioni pubbliche con aperture verso l'esterno, l'innovazione sociale implica generalmente un processo molto più radicato e decentralizzato. Di conseguenza, sono necessari strumenti adeguati perché l'innovazione sociale aperta possa avere luogo. Ad esempio, le tecnologie digitali sono potenti abilitatori, ma sono spesso necessarie anche risorse tangibili. In tal senso, Bria et al. (2015) sottolineano che mentre le soluzioni digitali sono molto utili per risolvere sfide sociali, la prossima fase dell'innovazione sociale digitale probabilmente si baserà fortemente sull'uso di makerspaces, fab labs e altri spazi collaborativi, poiché questi ambienti ampliano ulteriormente lo spettro di innovazione sociale reso possibile dalle tecnologie digitali.

In conclusione, l'innovazione sociale aperta facilita l'identificazione e la comprensione delle sfide della società attraverso un ciclo virtuoso di interazioni con vari attori che condividono la necessità di contribuire alla società. I cittadini possono trovare soluzioni insieme alle amministrazioni pubbliche e ad altre persone e istituzioni rilevanti se entrambe le parti portano all'attenzione del tavolo apertura, competenze e risorse necessarie.

Originalità del paper. Lo studio ha diversi elementi di originalità che alla comprensione dell'innovazione sociale aperta e del suo impatto sulle sfide della società contemporanea. In primo luogo, gli autori hanno individuato e analizzato pratiche di open social innovation che si distinguono dalle tradizionali strategie di innovazione. Questo aspetto è significativo poiché spesso mancava una comprensione approfondita di come l'innovazione aperta potesse essere applicata efficacemente per risolvere problemi sociali.

Secondo, Isinnova è stata frequentemente esaminata da studi precedenti (Corsini et al., 2021; Ferrigno & Cucino, 2021; Tani et al., 2022; Vesci et al., 2021). Alcuni di essi hanno fornito contributi significativi investigando sull'innovazione frugale in una situazione di crisi (Corsini et al., 2021; Vesci et al., 2021); altri hanno analizzato azioni di innovazione mirate (Ferrigno & Cucino, 2021). Tuttavia, presi nel loro insieme, questi studi hanno principalmente discusso del ruolo di Isinnova durante un contesto di crisi e dal punto di vista dell'azienda. Al contrario, in questo articolo viene fornita un'analisi ben documentata delle pratiche di open social innovation implementate dall'azienda e dai suoi principali stakeholder anche dopo il contesto di crisi.

Infine, gli autori hanno fornito indicazioni pratiche per manager e decisori politici. Le nostre offrono utili linee guida su come sviluppare strategie e politiche per affrontare le sfide sociali attraverso l'innovazione aperta, rendendo il lavoro rilevante non solo a livello accademico, ma anche operativo per coloro che devono prendere decisioni manageriali e politiche.

Track 8
Retailing & Service Management

The effect of entrepreneurial and customer orientations on shopper loyalty: an explorative study on small independent retailers

ALICE MANTOVANI¹ LARA PENCO² SANDRO CASTALDO³

Abstract

Small independent retailers play a pivotal role in the Italian economy, and in recent years they have had to compete with larger firms. This study aims to delve into these dynamics, investigating how independent small retailers manage to survive the larger giants. To this end, 15 in-depth interviews were conducted on small independent retailers operating in five Italian large cities. Authors investigated the role of Entrepreneurial Orientation (EO), Customer Orientation (CO), Shopper Loyalty and their social role in city centers and neighborhoods. The value of this manuscript lies in its exploration of the relationships emerged among constructs and highlights their influence on competitiveness, adding a valuable perspective to previous literature. From the study, it emerged that retailers are searching for new solutions to compete and to better satisfy their customers. This is possible due to high levels of EO serving as a stimulus for sustained strategic and marketing responses.

Keywords: *Small retailers, SME, entrepreneurial orientation, business model innovation, external competition, innovativeness and proactiveness.*

Framing of the research. *Small and medium-sized enterprises (SMEs) are instrumental in shaping the economic landscape of Europe, making significant contributions to job creation, wealth generation, innovation, and overall economic progress. In Italy, independent small retail businesses not only play a pivotal role in job creation and value addition but also have a positive impact on local economies and social cohesion in urban centers. Nevertheless, the ongoing crisis faced by small retailers, fueled by external competition from large shopping malls and e-commerce, presents a palpable threat to the social fabric of cities. The potential closure of these local businesses, acting as vital community hubs, could elicit feelings of decline and insecurity among citizens.*

Indeed, as highlighted by McDonald and Swinney (2019), small independent retailing firms play a crucial role, especially when fulfilling social functions. The recent pandemic has emphasized the importance of small local stores in providing social services to residents, including personalized services and home delivery. The proximity of these small stores to residents brings added value to a diverse range of consumers, particularly benefiting those facing disadvantages, such as the elderly and low-income families. Furthermore, small independent retail stores act as focal points for social interaction, as noted by Clarke and Banga (2010). Gilboa et al. (2019) argue that the social relationships and personalized attention offered by small shops are integral components of the customer experience.

The relational aspects inherent in small independent retailing firms confer competitive advantages (Pantano and Migliarese, 2014). Viewed in a broader context, the competitive pressures exerted by external malls and e-commerce pose a threat not only to the city center retailing system but also to the vitality of the neighborhood. Barata-Salgueiro (2021) posits that the presence of scattered small independent retailing firms in cities serves as a defense against desertification and insecurity. Additionally, it contributes to the appreciation of community identity (Runyan et al., 2007). In this study, we delve into four crucial dimensions concerning small businesses: specifically, we explore the role of Entrepreneurial Orientation (EO) in not only fostering Strategic Orientation (SO) and customer orientation (CO) but also in shaping their social impact within neighborhoods and city centers. EO, defined as the entrepreneur's inclination to cultivate market opportunities through continuous innovation, a proactive stance, and a willingness to take risks in pursuing new opportunities (Lumpkin & Dess, 1996; Covin & Slevin, 1989), serves as a focal point of our analysis. Griffin et al. (2006) discovered that EO in the retailing sector positively influences the development of knowledge resources

e-mail: lara.penco@economia.unige.it

³ University Bocconi - Milano
e-mail: sandro.castaldo@sdabocconi.it

geared towards constructing a competitive advantage. Grewal and Levy (2017) argued that EO contributes to enhancing competitiveness in retailing. Luiz dos Santos and Vieira Marinho (2018) delved into the correlation between EO in supermarket retailers and their Strategic Orientation, validating a positive relationship. In Addition, considering that small retailers are likely to implement strategies based on their specific role for customers and the local community, other approaches may be applied to analyze strategic paths related to the external environment.

The strategic orientation framework includes the characteristics of the Strategic Orientation towards customers, competitors, and other external forces and helps to understand how firms respond differently to the evolution of the competitive environment (Ferraresi et al., 2012). Miles & Snow (1978) define a classification of different typologies of strategic postures that lead to different Strategic Orientations (SO). This classification is especially useful for small and entrepreneurial businesses (Rugman & Verbeke, 1988). It categorizes firms into four types: prospectors, analyzers, defenders, and reactors (Anwar & Hasnu, 2017). Moreover, prioritizing Customer Orientation (CO) stands as a pivotal marketing strategy that enables companies to generate value for customers by comprehending their stated desires and needs (Narver and Slater, 1994). Within the retail sector, fulfilling customers' needs emerges as a crucial determinant of success, enhancing the company's overall performance and competitive standing (Tajeddini et al., 2013). It's crucial to underscore that the development of CO should adopt a forward-looking approach, anticipating the future needs and desires of customers. In this context, successful businesses need an elevated level of Entrepreneurial Orientation (EO). This encompasses elements such as social relationships, social affiliation, reciprocity, and a sense of community attachment. This connection is closely related to the themes of sustainability and social responsibility among small retailers, especially when these businesses serve societal functions (McDonald and Swinney, 2019). Consequently, the bond between customer support and the dedication of small retailers to their neighborhood and local community is robust.

Purpose of the paper. The purpose of this study is to investigate how small independent retailers manage to survive the larger giants and e-commerce. Beginning with an overview of profiles associated with small retailers, focusing on literature concerning small consumer services and retailing, our empirical research delves into the influence of Entrepreneurial Orientation (EO) on vital strategic elements for small independent retailing. These elements include Strategic Orientation (SO), and customer orientation (CO) - encompassing aspects like shopper loyalty, and sustainability. We consider that these research streams (Runyan and Droge, 2008) may help to understand the source of competitive advantage of small independent retailing firms. Based on these premises, our research questions are:

RQ1: What are the main features of the orientations adopted in small retailing?

RQ2: What are the entrepreneurial factors that help small shops to challenge the big player/e-commerce competition?

To address our research questions, we are conducting a comprehensive multiple-case study focused on small independent retailing firms. The deliberate choice of these firms stems from the widespread recognition of small retailing as a crucial economic activity. Small firms, often led by entrepreneurs and founders, frequently from the same family, exhibit a distinct leadership style that significantly shapes their approach to innovation and market dynamics (Penco et al., 2022). The main goal of this in-depth investigation is to analyze the dynamics and evolving strategies of small independent retailers. Our examination delves into their strategic orientations and underscores the pivotal role they play in establishing and sustaining customer relationships. The study seeks to assess how Entrepreneurial Orientation (EO) can strategically cultivate robust customer relationships while upholding quality and tradition. Employing a multiple case study approach, the research follows methodologies outlined by Cunningham (1997), Eisenhardt & Graebner (2007), Eisenhardt (1989), Pratt (2009), and Yin (1994). Additionally, the study aims to contribute to and deepen existing literature on EO, Strategic Orientation (SO), Customer Orientation (CO), shopper loyalty, and sustainability through concrete case studies (Eisenhardt, 1989; Eisenhardt & Graebner, 2007). The chosen approach, aligning with Eisenhardt's (1989) framework, allows for the integration of various constructs, establishing meaningful connections between them (Gehman et al., 2018).

Methodology. The research employs a qualitative approach, utilizing semi-structured in-depth interviews consisting of 26 questions. We engaged in these interviews with the owners or managers of 15 companies operating in diverse sectors, such as clothing and accessories, restaurants, home and furniture, and entertainment. The decision to focus on these specific businesses is driven by their significant impact on the Italian economy. The selected companies meet specific criteria: they are located in five major Italian cities, are classified as SMEs based on turnover and number of employees, and are recognized as small, reputable, and benchmark retailers within their local communities. Notably, all but one of the cases examined were family businesses, with entrepreneurs assuming leadership roles. The semi-structured interviews were conducted between March 2023 and April 2023. We scheduled appointments via email and phone calls with interested enterprises identified during a pre-screening phase. The actual representatives interviewed included entrepreneurs, family members involved in enterprise governance, or top managers (in one case only). Brief profiles of the interviewees and main characteristics are summarized in Table 1.

Table 1- Respondent profiles and interview characteristics

<i>No./interview code</i>	<i>Company Type</i>	<i>Interview period</i>	<i>Interviewees role</i>	<i>City</i>
H01	Patisserie/Bakery	23/03/2023	Family member	Roma
H02	Bookstore	23/03/2023	Business owner	Roma
H03	Gadgets	03/04/2023	Business owner	Roma
H04	Coffee shop and gourmet products	30/03/2023	Management Assistant	Venezia
H05	Design	30/03/2023	Business owner	Venezia
H06	Jewelry	30/03/2023	Business owner	Venezia
H07	Accessories	22/03/2023	Business owner	Napoli
H08	Optician	06/04/2023	Business owner	Napoli
H09	Pizzeria	22/03/2023	Business owner	Napoli
H10	Jewelry	12/04/2023	Business owner	Milano
H11	Hardware	12/04/2023	Business owner	Milano

H15	Gastronomy and restaurant	11/04/2023	Business owner	Firenze

Source: Authors' elaboration

The interviews were audio-recorded, transcribed, and translated from Italian to English. The open coding practice was performed. This method is suitable for the study of complex phenomena through the coding of labels, concepts, and words (Penco et al. 2022). Interviews were codified through textual analysis. They were independently codified by each author and were discussed together to reduce subjectivity in interpretation of the data. Each construct (entrepreneurial orientation, Strategic Orientation, consumer orientation, shopper loyalty, and sustainability) was then evaluated. The purpose of the evaluation phase was to identify the level of engagement with respect to the analyzed factor. Thus, it was possible to distinguish retailers in which the orientation/construct was absent or very weak, from situations where construct/factors were ready to be adopted/implemented. Additionally, the analysis revealed firms that show great involvement in the analyzed orientations/constructs.

Results. The analysis highlights that the key to success lies in the quality of products and services, fostering customer loyalty. The connection between quality, customer satisfaction, and store loyalty has long been a subject of debate in small retailers' literature. Examining the business model of the studied small retailers reveals a prominent emphasis on tradition, despite the industry's general pursuit of innovation. This aligns with findings from prior studies (Cuesta-Valino et al., 2022) that establish a link between tradition and retailers' success. Our analysis affirms how tradition influences the emotional atmosphere within the point of sale (Morhart et al., 2016). Interestingly, while tradition remains pivotal, many small retailers, especially those established more recently, are actively working to incorporate innovative elements into their business models. Expanding the analysis to the retailing mix, key factors include positioning/image, assortment, merchandising, and store ambiance. These aspects prove crucial for businesses, allowing them to showcase their uniqueness and stand out against larger competitors. For the topic of branded products/merchandising, interviews suggest that merchandising doesn't exert a direct strategic impact on the performance of small retailers. However, the results enable the identification of connections between different constructs (EO, SO, CO, shopper loyalty, and sustainability) and their influence on competitiveness (Kajalo & Lindblom, 2015).

In particular, the overall average Entrepreneurial Orientation (EO) propensity is notably strong, particularly in the dimensions of innovativeness and proactiveness. Risk-taking propensity, although inherent in entrepreneurial activities, tends to rate lower than the other two dimensions in all samples. The study indicates that innovativeness and proactiveness are prominent entrepreneurial characteristics, with risk-taking playing a facilitating role, sometimes indirectly, and consequently influencing the preceding constructs. Therefore, the analysis suggests that higher propensities toward innovativeness and proactivity correspond to higher EO levels (Anwar & Hasnu, 2017). Conversely, lower propensities toward innovativeness result in lower EO levels, except in terms of digitalization and the use of social media for business communication.

Moreover, in the analysis of the Strategic Orientation (SO) construct, the study reveals a common trend among small distributors to adopt a defined SO across three distinct dimensions: Analyze, Defend, and Prospect, with the React dimension appearing less actively pursued. Examining SO further unveils a connection with different orientations of Entrepreneurial Orientation (EO). Specifically, entrepreneurs emphasizing innovativeness and proactivity demonstrate a prospective SO. An analytical SO primarily revolves around proactivity, where surveyed independent small retailers

analyze the market to introduce adaptable products in response to shifting demands. Conversely, lower levels of innovativeness align with a reactive SO, where retailers aim to maintain product stability without significant alterations.

In addition, our research shows that the customer orientation of small retailers is a basic element to constitute a competitive advantage with which they can diversify against larger competitors. All retailers in the sample report a high relevance of the customer relationship, especially through the offer of highly personalized services, capable of generating high customer satisfaction. The analysis shows how retailers can bring their business to long-term profitability through their attention to the customer by creating quality products and services (Deshpandé et al., 1993). However, Customer Orientation (CO) truly becomes significant in the long term only when influenced by high levels of Entrepreneurial Orientation (EO) and Strategic Orientation (SO). To gain a comprehensive understanding of the success and effectiveness of customer orientation (CO), it is essential to closely link CO with the embedded innovativeness and proactiveness within the organizational culture of retailers, as emphasized by Deshpande et al. (1993). This implies that organizations cultivating a corporate culture inclined toward innovation and proactivity, indicative of a high Entrepreneurial Orientation (EO), are more likely to exhibit outstanding customer attention, as also indicated by Tajeddini et al. (2010). The research also reveals a very relevant role of shopper loyalty. In particular, each activity is oriented towards the customer experience, considered as the total of the subjective judgments derived from the satisfaction obtained by the customer during the shopping phase and on which the choice of the shop is based (Paul et al., 2016). Additionally, the study reveals that salespeople in small shops are highly motivated to cultivate relationships with their customers, resulting in a positive correlation between shop attachment and shopper loyalty (Badrinarayanan & Becerra, 2019). Thus, the conducted analysis establishes a clear relationship between consumer orientation and shopper loyalty.

Finally, from our study, it emerges that the relationship with the society and community in which the small retailers are established is a determining factor for their image and reputation, even if it is not yet a fully developed factor. Many studies agree with this perspective; physical stores need to put more emphasis on "soft values" (Ekstrom & Jonsson, 2022). This research also shows that small shops are still very important in quarters, especially if they provide functions for society.

In summary, when Entrepreneurial Orientation (EO) is high, Strategic Orientation (SO) tends to be either Prospector or Analyzer. Both types of orientations, Prospector and Analyzer, prioritize investing in Customer Orientation (CO) with a long-term perspective to anticipate future customer needs and desires. This finding supports existing literature indicating that a strong EO, particularly in terms of innovativeness and proactiveness, encourages businesses to explore the gap between current and future market needs (Smith and Jambulingam, 2018). The study also highlights that a long-term CO positively influences shopper loyalty. Moreover, social sustainability emerges as a dual factor: it not only enhances CO by aligning businesses with social and ethical values, appealing to socially conscious consumers but also stimulates shopper loyalty by emphasizing the social role of small retailing in the local community.

- P1: Small retailers with a low level of innovativeness and proactiveness are likely to be defined with a Reactor for SO.
- P2: Small retailers with EO based on proactiveness are likely to adopt an Analyzer SO.
- P3: Small retailers with EO based on innovativeness and proactiveness are likely to adopt a Prospector SO.
- P4: Small retailers with high EO that are analyzers and prospector are likely to adopt more quickly to market needs and construct a long-term CO.
- P5: Consumer orientation impact on shopper loyalty
- P6: Social Sustainability influences shopper loyalty and customer orientation
- P7: Small retailers with low EO that are reactor are likely to adopt more slowly to market needs and construct a short-term CO.

Figure 2: summary of results

Source: Authors' elaboration

Research limitations: *This study considers a limited sample size, counting only 15 small independents. Secondly, the study was cross-sectional, and it would be beneficial to conduct a longitudinal study to extract trends and strategic evolutions over time. Additionally, the study included a limited number of variables, and an analysis of other aspects such as the entrepreneur's personal traits and cultural background is crucial to better understand the antecedents of the strategic and entrepreneurial attitude.*

Managerial Implications: *These findings carry noteworthy implications for both practitioners and researchers. Firstly, our study contributes to the literature on small consumer services and retailing entrepreneurs, providing valuable insights into the application of strategic tools for creating customer value and ensuring the long-term survival of small independent retailing firms. Secondly, it extends the scope of entrepreneurship and marketing literature by offering a model that explains strategic behaviors and identifies the factors contributing to the success of entrepreneurs in small independent retailing. Few studies have applied Entrepreneurial Orientation (EO) to interpret strategic behaviors in small retailing, and this research fills a crucial gap by highlighting the significant role of EO in shaping the strategic and marketing responses of small retailing businesses. Importantly, our analysis underscores that EO plays a pivotal role in adopting a prospector orientation. The centrality of EO, particularly in fostering innovativeness, proves essential for the competitive resilience of small independent retailing firms against larger counterparts. Therefore, actively nurturing EO and aligning human resource management with this entrepreneurial mindset is imperative. Establishing clear communication channels regarding the strategic importance of EO is vital for steering a trajectory marked by innovativeness, a proactive Strategic Orientation, and a strong emphasis on customer relationships. Taking a mid-level perspective, this study advocates for proactive investment from local policymakers to protect and strengthen small independent retailing businesses. Practical measures include initiatives to enhance the local environment, support for local projects like city branding, and a cautious approach to investments in large malls situated near local centers. Expanding the view to a broader, national level, the government and relevant ministries are encouraged to facilitate the efforts of small independent retailing entrepreneurs. This involves simplifying bureaucratic processes, introducing fiscal incentives that support local activities, and directing investments toward research programs and training courses. Establishing specialized agencies to identify and capitalize on significant opportunities for small retailers is a recommended strategy for promoting their sustained growth and competitiveness.*

Originality of the paper: *Analyzing the relationship between EO, SO, CO, shopper loyalty, and social sustainability in small independent retailers, with the aim also to understand how they can survive the competition with major stores, is relevant from a strategic perspective. We contribute to this topic by pointing out the crucial role of EO and pointing out that the investigated small retailers did not only focus their attention on the survival phase but also searched for new solutions to compete and to better satisfy their customers, creating a strong relationship focused on trust and loyalty.*

Ensuring customer satisfaction and loyalty of online health and well-being: a comparison study across types of services

GIADA SALVIETTI¹ SILVIA RANFAGNI² DANIO BERTI³

Abstract

Online offering of services for health, wellness and well-being has rapidly increased in latest years, leading to a variety of services of different nature being offered and communicated across multiple touchpoints. Such complexity is reflected in a multitude of studies addressing customer satisfaction and customer loyalty by focusing on specific online service delivery contexts. Drawing from literature on e-service quality, online health service provision, and healthcare and well-being professionals as service providers, our study aims to shed light on the role of various aspects affect customer satisfaction and customer loyalty across types of services offered. A model is proposed, combining both e-service offering-related elements and provider-related elements with variables accounting for touchpoints encountered during the customer's journey, to investigate the latter's effects on customers' evaluations of the service. Data were collected through an online survey of 1,220 Italian customers. Significant differences are found, across types of services, with reference to factors attributable to both elements, and to touchpoints at different stages of the journey.

Key words: *online services; health; well-being; customer satisfaction; customer loyalty; touchpoints*

Framing of the research. *Online-based systems have increasingly populated the market for health and well-being services, thus transitioning from a traditional physician-based or provider-based delivery model. Such evolution, that has rapidly increased since the pandemic hit (Zhu et al., 2024), has brought customers many newfound advancements, such as the possibility to receive treatment and care at a distance (Dahl et al., 2019). Also, the availability of multiple platforms and touchpoints dedicated are allowing customers to take greater control of their care decisions prior to and during the service encounter (Labrecque et al., 2013). Various studies have therefore been developed, in latest years, addressing these online services' potential in influencing customers' behaviors and attitudes (e.g. electronic Word-of-Mouth and continued use of the abilitating technology - Yang et al., 2015; patients' relationship with and trust in their physician – Audrain-Pontevia and Menvielle, 2018). Current literature with this respect is of interdisciplinary nature, and has been developed within the fields of medical sciences, motor sciences, psychology, as well as marketing and management; and as such have addressed a wide range of services, from telemedicine to nutritional consultancy to physical wellbeing interventions. The present study intervenes in this literature by addressing the generation of customer satisfaction and loyalty by comparing a variety of online services that fall under the umbrella of “health and well-being services”.*

Purpose of the paper. *The present study investigates factors driving customer satisfaction and customer loyalty concerning digital services for health and well-being. On the one hand, the paper aims to weight various aspects concerning services provided online with those concerning the healthcare professional delivering the services. We pose, in fact, that both aspects must be accounted for at once when addressing health and well-being services. On the other hand, the paper aims to identify whether the various touchpoints that constitute customer journeys when purchasing health and well-being services online. The introduction of touchpoints as variables within the study is oriented at achieving a deeper understanding of how these contextual elements determine customer satisfaction by acting as signals throughout the journey. Moreover, it allows to differentiate between various contexts through which the service is delivered, each with a diverse degree of interaction and integration (e.g. from purely informational websites to mobile apps, from social media to video-call and communication interfaces).*

Two research questions are formulated as follows:

- *RQ1: Identify which elements related to e-service offering delivery and related to the provider have an effect on customer satisfaction and loyalty intentions, in the context of digital health and well-being services;*

- RQ2: Shed light on the role of touchpoints in affecting customer evaluation of e-service offering-related elements and provider-related elements, as far as digital health and well-being services are concerned.

To achieve the study's goals, current literature on e-services quality, digital health and well-being services, customer satisfaction and customer loyalty has been reviewed, leading to the identification of a model to be tested.

The model is proposed as follows (see Figure 1):

- Touchpoints involved: three blocks of touchpoints were identified, to account for a) those through which the first contact with the service occurred; b) those used by the customer to gather information about the service; c) those through which the service has been provided.

Three lists of touchpoints have been identified on behalf of previous literature (e.g. Swan et al., 2018) as well as from practice. As what concerns first contact and information collection touchpoints, we ensured to include both provider-owned touchpoints and third-party touchpoints (either one-way or interactive) (Baxendale et al., 2015). Customers not only collect providers' own information, but also access other users' shared information about the service and the provider, which contribute to creating their expectations (Kitsios et al., 2019). Because of this, we expect that touchpoints encountered will have an effect on customers' actual evaluation on both the elements related to the e-service offering and those related to the provider.

- E-service offering-related elements: 5 aspects have been found as crucial in determining a response from customers, by comparing multiple studies on health and well-being services, especially those focusing on the online dimensions of service provision. Both the "clarity" and the "assistance and information functions" elements concerned the service delivering reliable, trustworthy, understandable information and/or allowing customers to receive assistance in case of doubts or misunderstanding (Chang et al., 2015). The "usability / ease-of-use" element referred to the user experience the customer has while navigating the online touchpoint through which the service is delivered (Gummerus et al., 2004). The contribution to the service by other participants was introduced to assess all those contexts and situations where multiple customers at once contribute to the service experience under evaluation, such as group classes or therapy sessions (Brouzos et al., 2021). Finally, perceived usefulness of the service was adopted to measure the structural and design-oriented dimension of the service (Kitsios et al., 2019).

- Provider-related elements: similarly to e-service offering-related elements, 7 aspects concerning the provider delivering the health and well-being service have been identified. Interestingly, it emerged from current literature that aspects concerning healthcare professionals, psychologists and physicians do not greatly differ between studies developed in the online or offline sectors, thus stressing the importance of the human element in all service contexts. Following Leisen and Hyman (2004) and subsequent adaptations, the elements chosen - thorough evaluation of problems, appropriate and effective treatment, clear and complete communication, understanding of patient's individual experiences, confidentiality, honesty and respect for the patient, partnership building and power sharing – are able to cover both the benevolence and technical competence dimensions of patient-provider trust.

Figure 1 – Proposed model

Methodology. Data were gathered by means of an online survey conducted on a sample of 1,411 Italian consumers, between the months of March and May 2023. Given the sensitivity of some of the services investigated, we adopted a CAWI methodologies, with research assistants being available to help overcome any uncertainty or questions. Sampling was based on probabilistic methods, through stratified sampling (by age, gender and residence) on the list of e-panelists.

The questionnaire was composed of three sections. The first one, of a descriptive nature, was used to draw a comprehensive profile of participants and ensure the maximum representativeness of the sample. The second section addressed the search and selection process customers went through before purchasing the online service for health and well-being, including the main touchpoint through which they became aware of the service, the main touchpoint used to gather information about the service, and whether there had been previous experiences – either offline or online – with the service. Moreover, consumers were asked to disclose whether they reviewed the service publicly, privately, or they didn't share at all. The third and final section of the questionnaire involved evaluating their satisfaction over the service for health and well-being, both overall and in detail. 5 factors were used to investigate the delivery aspects of the online service (Brouzos et al., 2021; Chang et al., 2015; Kitsios et al., 2019), and 7 factors to assess aspects concerning the provider / professional delivering said service (adapted from Leisen and Hyman, 2004). Finally, a 3-item scale was used to assess loyalty intentions, measuring loyalty of behavioral nature (Murshed et al., 2023, adapted from Johnson et al., 2006). Reliability and validity of constructs and items was assessed through internal consistency and composite reliability (Nunnally, 1994) as well as factor loadings (Gerbing and Anderson, 1988).

Only consumers who purchased at least one online service for health and well-being in the last year were allowed to proceed in the survey (1,302). Those who purchased more than one of these services were asked to focus on the service they deemed as most relevant for them before answering further questions. Participants were provided with a list of 7 types of online services for health and well-being, that was created based on previous literature and cases from practice. The list was discussed and validated by researchers, also following a pre-test of the questionnaire conducted on 90 students. Following data cleaning based on completeness, attention checks and compilation time, 1,220 questionnaires were deemed valid and analyzed. The final sample included 42% men and 58% women. As for age, most participants were in the "18-29" age bracket (74%); the other participants were equally distributed in the "30-39", "40-49", "50-59" and "60-69" age ranges. The research did not distinguish by gender or age, but both variables were controlled for.

Data were analyzed through multiple linear Ordinary Least Squares (OLS) regression models. The method was chosen in line with previous studies on touchpoints, that employ regression and model touchpoints as dummy variables (e.g. Baxendale et al., 2015). Demographic variables of gender and age were used as controls when running the model, alongside other control variables that we hypothesized could influence customer satisfaction and/or customer loyalty: specifically, other analogous digital services being purchased, previous experiences with the service (online or offline), and customers still using the service at the time of survey completion. On the one hand, previous purchases can affect customers' response to any direct or indirect contact with the service itself or with its provider (McCull-Kennedy et al., 2015); on the other hand, customer satisfaction is expressed and measured as referred to a certain point in time along the process of service delivery (Danaher and Mattsson, 1994).

Results. The model was first tested on the entire sample (1,220), regardless of the type of service, to assess the impact of the three variables investigated on the two dependent variables, customer satisfaction and loyalty intentions.

Results will be presented starting from RQ1, which concerns the relationship between e-service-related elements, provider-related elements and customer satisfaction and loyalty intentions as dependent variables.

First of all, we confirm that overall e-service-related elements and provider-related elements have been found to have a positive impact on both customer satisfaction (respectively: $\beta = .629$, $p = 0.000$, and $\beta = .203$, $p = 0.000$) and loyalty intentions (respectively: $\beta = .726$, $p = 0.000$, and $\beta = .471$, $p = 0.000$). As what concerns each investigated aspect, we found that:

- clarity of the service, usability of the service, assistance and information functions, and perceived usefulness of the service are positively related to customer satisfaction.
- clarity of the service, perceived usefulness of the service, and the eventual involvement of other participants are positively related to loyalty intentions.
- providers' appropriate and effective treatment and confidentiality are positively related to customer satisfaction.
- provider's thorough evaluation of problems, appropriate and effective treatment, the understanding of the patient's individual experiences and the display of honesty and respect are positively related to loyalty intentions.

Table 1 provides the detail of these measures. To ensure readability of results, only significant values are shown.

Interestingly, control variables were not significant in affecting these relationships, with a single exception.

Overall, the number of digital services for health and well-being purchased in a year and whether there had been previous experiences with such services (either online or offline) does not affect neither customer satisfaction nor loyalty intentions. Whether the service was still being provided or not at the time of survey completion did not hold an effect on customer satisfaction, but it did on loyalty intentions; specifically, those who were still using the service when they answered the survey had more positive loyalty intentions than those who weren't ($\beta = .141$, $p = 0.006$).

Table 1 - Effects of e-service offering elements and provider elements on customer satisfaction and customer loyalty

Variables	Regression Beta Coefficients	Stand. Regr. Beta Coefficients	t-values	P > t
Customer Satisfaction				
SERVICE ELEMENTS				
Clarity	.120	.129	3.05	.002

Assistance / inform. Functions	.070	.079	1.98	.048
Perceived usefulness	.159	.173	3.90	.000
PROVIDER ELEMENTS				
Appropriate and effective treatment	.166	.178	3.93	.000
Maintains confidentiality	.061	.075	2.01	.045
Loyalty Intentions				
SERVICE ELEMENTS				
Clarity	.116	.104	3.31	.001
Perceived usefulness	.193	.175	5.32	.000
Involvement of other participants	.085	.084	3.02	.003
PROVIDER ELEMENTS				
Thorough evaluation of problems	.125	.120	3.57	.000
Appropriate and effective treatment	.149	.134	3.98	.000
Understanding of patient's individual experiences	.108	.103	3.33	.001
Honesty and respect for the patient	.169	.142	4.41	.000

We subsequently decided to break down the model to each of the 7 types of online services for health and well-being investigated. In the previous analysis, a control dummy variable indicating the type of service participants responded for was barely significant ($p = 0.10$), which encouraged us to further investigate specificities across services. Answers obtained per each type of service were as follows:

- 56 about family well-being services (i.e. involving parents-children, couples, etc.);
- 541 about physical well-being services (e.g. nutrition, fitness, etc.);
- 146 about psycho-physical well-being services (e.g. yoga, pilates, etc.);
- 79 about mental well-being services (e.g. self-esteem improvement);
- 36 about social well-being services (e.g. feeling at ease with others);
- 171 about medical services – either general or specialist – provided by medical or paramedical staff;
- 191 about services for mental and psychological health (e.g. anxiety, panic attacks, anger management, etc.)

Due to the size of each sub-sample, we were able to run in-depth analyses about 5 out of 7 service types: physical well-being services; psycho-physical well-being services; mental well-being services; medical services – either general or specialist; and services for mental and psychological health.

Table 2 shows and compares the results obtain for each of the 5 service types; again, to improve the readability, only significant results are presented, with standardized beta coefficients. Besides differences specific to each service, a first remark concerns different variables contributing to customer satisfaction and loyalty intentions. A second remark concerns the scale of the digital services for health and well-being delivered: as the severity of the issues increases, from physical well-being to mental health, customer satisfaction is less driven by the e-services elements. Moreover, customers tend to focus on very specific aspects concerning the provider that is delivering the service at hand.

Table 2 – Effects of e-service offering elements and provider elements on customer satisfaction and customer loyalty across service types

Moving to RQ2, the second goal for the study was to analyze the effects of touchpoints involved in the customer journey of digital services for health and well-being on customers' evaluation of e-service and provider. Again, the analysis has been performed on both the entire sample and by narrowing down the database to each investigated service type, in order to appreciate differences.

According to the main sample, neither first contact touchpoints nor information collection touchpoints were significant, meaning that – overall – they are not able to influence customers' evaluation of digital services for health and well-being and of their provider. Conversely, touchpoints used to provide the services had a significant impact: specifically, mobile apps, video calls and social media all had positive impact on how the provider was overall evaluated, and video calls and social media also enhanced evaluation of the e-service aspects. This suggests that touchpoints

allowing for swift contacts, direct interpersonal communication and availability significantly improve customers' perception of the service received.

By comparing the effect of touchpoints across service types, we found that:

- the effects of certain service provision touchpoints are confirmed for physical and psycho-physical service but not for mental well-being, medical services and mental and psychological health services. This finding appears consistent with those from RQ1, where the contextual elements revolving around service provision were less important or not significant at all for services addressing more "severe" issues. Also, no touchpoint has had a significant effect on customers' evaluation of these services, for neither of both aspects investigated, which reinforces such interpretation.

- as what concerns first contact touchpoint, negative effects of certain touchpoints on the evaluation of providers are found for psycho-physical services and mental health services. This finding implies that customers who, respectively, received advice from friends and family or came across the provider on social media, and/or encountered the provider's offline ads, also later evaluated him/her more negatively.

- as what concerns information collection touchpoints, a positive effect was found for active search on online blogs, journals and forums (for physical well-being services) on how the service aspects were evaluated. Also, a negative effect was found for watching video-reviews on the provider's evaluation, for mental well-being services.

Overall, findings have brought out that the touchpoints used to deliver information or to provide digital services for health and well-being may affect customers' evaluations of the aspects regarding the service itself or the provider who delivers it. Details per each service are provided in Table 3.

Table 3 – Effects of touchpoints on e-service offering elements and provider elements, across samples

	<i>First contact touchpoint</i>	<i>Information collection touchpoint</i>	<i>Service provision touchpoint</i>
Main sample	No effects	No effects.	Effects of: - mobile app on provider (.079) - video calls on service (.079) and provider (.101) - social media on service (.067) and provider (.093)
Physical well-being	No effects.	Effects of - online blogs, journals, forums on service (.097)	Effects of: - mobile app on provider (-.181) - video calls on service (.135) and provider (.149) - social media on service (.105) and provider (.122)
Psycho-physical well-being	Effects of: - friends and family on provider (-.268) - social on provider (-.229)	No effects	Effect of - video calls on provider (.229)
Mental well-being	Effect of: - offline ads on provider (-.313)	Effect of: - video reviews on provider (-.297)	No effects.
Medical services	No effects.	No effects.	No effects.
Mental and psychological health	No effects.	No effects.	No effects.

Research limitations. The main limitation concerns the cross-sectional design of the study, that does not provide enough confidence to claim a causal relationship between customers' evaluation of service-related elements, provider-related elements, customer satisfaction and customer loyalty. Future studies could employ longitudinal designs to improve such aspect, considering that these services usually require multiple sessions. This would be consistent with the control variable on ongoing services being significant for customer loyalty.

Concerning touchpoints, other two limitations can be found. First, touchpoints used for first contact and for information gathering were modeled as dummy variables indicating whether they were or were not the main source for customers. Extensions of the study focusing on this aspect might also ask customers for an evaluation of their experience with these touchpoints nor customers' personal preference for interacting with them. By asking to indicate the main touchpoint used, we assumed customers would use the touchpoint they were more at ease with. Future studies might also address this. Second, the study of touchpoints used for service provision might be further enriched by integrating the response speed and interaction frequency variables, since our findings pointed towards a greater appreciation of those touchpoints enabling live interactions.

Managerial implications. The study entails managerial implications by showing how different types of services vary in terms of aspects involving the offering and the provider significant for developing customer satisfaction and customer loyalty intentions. Even though findings have been provided for health and well-being digital services in general, it is clear from the division between services, that crucial aspects must be addressed accordingly. We therefore believe that, on the one hand, results will be useful to consider while designing and redesigning of these services, as well as to guide service recovery actions. Customers leaving and switching while the treatment is being provided, or not returning for future treatments, might in fact be gained back by designing actions oriented at building back trust based on critical aspects driving satisfaction. A final implication is tied to the role of touchpoints: insights on positive or negative effects of encountering certain touchpoints might be useful for providers to reconsider at least their own use of said touchpoints

and/or try to counteract the effects of third-party owned ones (such as providing reactions of responses to prior customers' reviews). As far as service provision touchpoints are concerned, findings point towards those touchpoints allowing a more meaningful dyadic interaction between customers and providers as those more positively effective on customers' evaluations and, indirectly, satisfaction. This is consistent with previous literature addressing responsiveness and patient satisfaction in health communities (Yang et al., 2015).

Originality of the paper. Many papers in extant literature have addressed the topic of health and well-being services by adopting a service quality perspective, rather than a customer satisfaction one. Although the two concepts may overlap (Dabholkar, 1995), there is a precise distinction that relies on the first being cognitive in nature and the latter being mostly an emotional response (Danaher and Mattsson, 1994). Also, most studies investigating digital health and well-being services have been doing so by focusing on a specific type of service provided (i.e. hospital-provided online care, individual or group online therapy sessions, etc). Of these, most focused on mobile health apps or professional websites.

The study, therefore, aimed to bring comparison between services of different nature that all contribute, in various ways, to customers' health and well-being. Moreover, the study is novel in terms of trying to identify the role of touchpoints constituting the customers' journey before and during the service delivery. Among these, the study included touchpoints new to these contexts, such as social media or communication / videocall platforms, whose use has significantly spread after the pandemic.

Digital Transformation in the Italian Restaurant Industry: Navigating the Challenges and Opportunities of Food Delivery Services

ALBERTO SUSCO¹ DAVIDE CANAVESIO² MONICA CUGNO³

Abstract

The advent of food delivery services has significantly transformed the restaurant industry, presenting both challenges and opportunities for restaurant management. This paper analyzes the change in processes, including at the managerial level, that has occurred in restaurant management with the advent of food delivery (Chen et al, 2019), particularly focusing on those types of restaurants that use food delivery the most, such as chains or individual restaurants, operating in the Quick Service Restaurants sector. The Italian food delivery market is growing at a rapid pace and recently witnessed strategic acquisitions, in line with the global trend of digitalization of food industry. (Rizzica and Giorgiantonio, 2018) Restaurants face a drop in the number of dine-in clients, limitation in the dining area, and need to be more efficient in the market. Consequently, they are depending on third-party food delivery services to overcome these issues. One of the advantages as stated by Athira and Devakumar (2021), is that these platforms provide the option of limitlessly expanding dining areas, hence, allowing restaurants to generate larger profits. The article stresses the need for Italian restaurants to adapt to the digital transformation that is taking place in the industry. It implies that they should strive towards improving kitchen operations to handle both dine in and delivery orders efficiently. It also suggests adoption of digital marketing strategies for wider audience access. Further, the paper recommends reviewing the financial models that fail to account for the commissions charged by delivery platforms. The results reveal the difficulties that food delivery service systems pose in restaurant management but offer creative solutions to conventional issues and bring Italy's restaurant industry into the digital age.

Key words: food delivery; digital; management; qsr; food;

Framing of the research. *The basic assumptions in the restaurant industry have in recent years been altered, driven by the influence of food delivery services. This revolution has ushered in the new stage of restaurant management, which is a double-edged sword of evidence and rewards. The emergence of food delivery services in the traditional restaurant model has required the review of the core business, operational, and strategic frameworks especially in the fast food sector. This paper explores this evolution in detail with an emphasis on the Italian food delivery market, which is a microcosm of the global trend towards digitalization in food service.*

Food Delivery Services have played a key role in the sudden growth of movements within the Italian market in conjunction with the global trend toward digitization (Oncini et al, 2020). This change is not only a reflection of consumers' need for ease but also a proactive adjustment of the restaurants to the trend in the consumption of foods. The decrease in dine-in customer numbers (Ma et al, 2021), mostly because of low seating capacities and the need for higher market presence, has led to the use of third-party food delivery platforms by restaurants. These platforms stand to present some opportunities whereby a new income stream is created as well as the ability to reach a wider customer base without restrictions on physical location and seating capacity (Brar et al, 2021).

This paper, inspired by the findings of Chen et al. (2019) and the research of Rizzica and Giorgiantonio (2018), intends to identify the changes in the management processes of restaurants, happened due to the arrival of food delivery services. It is devoted to the QSR sector, and special circumstances and opportunities for both chains and independent restaurants in Italy. Through analyzing strategic responses of these restaurants like kitchen operation optimizations for dual service lines, digital marketing strategies adoption and financial models' adjustment to delivery platform commissions, this study helps to understand the need for Italian restaurants to adjust to a digital shift.

The results of this study are aimed at adding to the wider discussion of digital alteration of the restaurant business (Kobez et al, 2018), in which the innovative solutions that food delivery services provide to traditional problems are emphasized. The purpose of this is to give a broad perspective on the way these services are shaping the face of Italian restaurants in a digital time, following out from other, more international markets that are undergoing the same changes.

Purpose of the paper. *The main aim of this study is to focus on the revolutionary impact that food delivery services (Recuero-Virto, Valilla-Arospide, 2022) have had on restaurant operations. Under this new paradigm shift, which is quite a deviation from the old models that revolved around dine-in and takeaway services in the absence of courier services primarily, the assumptions are that suppliers are competing on a single price and customers are the ones deciding to buy (Sweeney et al, 2015). In making the business model central in the restaurant industry, particularly in the aftermath of the digital revolution, which has introduced food delivery as a major part of the business model, the aim of this study is to take apart the operational, strategic, and managerial transformations that have taken place in the restaurant industry. Of interest is the shift in restaurant operation models from those that did not allow for the entry of couriers and did not provide any special preparations for delivery, to one where the lines are designed explicitly for delivery purposes.*

The knowledge of this progression is particularly important for a few reasons. First, it is a form of a global change in consumer behavior and preferences, which is found in a growing demand for convenience, speed, and diversity. In the second place, it presents the adaptive methods adopted by restaurants to deal with the challenges and opportunities of this innovation. Other strategies include reorganizing kitchen operations, changing menu items, and the utilization of digital technology to control orders and delivery logistics. It also addresses the economic and commercial implications of such changes, from the revenue streams and profit margins up to the market positioning and consumer contact. To sum up, it underlines the consequences of these changes.

The important of this study lies in the ability to provide a comprehensive analysis of the operational changes that have been observed in the restaurant industry. It also offers a glimpse of the strategic adjustments needed for survival in the digital era. This research aims to reveal the creative possibilities that the restaurants are taking up.

This is achieved through an analysis of the shift in traditional takeaway models to delivery-focused activities. In addition, it supports the educational and practical knowledge about how digitization is changing industry standards and demands. It also works as a compass for restaurant owners, managers and policy makers in how to maneuver through the labyrinth that is the food delivery sector.

Methodology. *Using the given abstract and pertinent literature, a comprehensive mixed-methods research methodology can be developed for the analysis of restaurants with versus without food delivery services. This research is focused on the major changes in the restaurant business that were brought by food delivery services. This mixed-methodology will make use of both quantitative and qualitative methodologies to evaluate process changes, including at the managerial levels. Using this methodology, we are able to overcome the limitations of quantitative and qualitative methods through the employment of mixed methodologies, which in turn makes it easier for them to acquire comprehensive information that would otherwise be unreachable through the use of either method in isolation (Almeida, 2018). Although using different approaches makes research more time-consuming because there are two distinct types of data that need to be collected and analyzed independently (Creswell, Clark, 2017), we believe it is the best solution to provide accurate analysis of ongoing research.*

In the Italian industry, this methodology will concentrate on Quick Service Restaurants (QSRs). A plan that is well-organized and built upon the objectives outlined in the abstract, supported by data from related studies, can be outlined as follows:

The design of this study is to scrutinize and contrast the changes in operation and management in quick serve restaurants (QSRs) in Italy that offer and do not offer food delivery services. The emphasis will be put on kitchen processes and control models.

The sample selection will be performed using a basic quantitative sampling, where Italy has a substantial number of quick-service restaurants (QSRs), with half of them utilizing food delivery services and the other half not.

The objective of the qualitative sample is to select a subset from the quantitative sample in order to conduct in-depth interviews and case studies. This selection ensures diversity in terms of geography, size, and client base.

Data collection methods for quantitative data utilize structured surveys to gather data on the operational efficiency, revenue sources, consumer reach, and financial success of both categories of restaurants (Phellas et al, 2011).

Qualitative data refers to information that is descriptive in nature and cannot be measured or quantified. It includes data obtained through methods such as interviews, observations, and open-ended survey questions. To gain a better understanding of the advantages and challenges associated with incorporating food delivery services, it is advisable to carry out semi-structured interviews with restaurant owners and managers, as well as organise focus groups with staff and customers. Furthermore, it is necessary to scrutinize the financial documents and digital marketing strategies to assess their impact on market visibility and profitability.

Apply thematic analysis (Braun et al, 2012) to identify common themes and differences in managerial practices, challenges encountered, and strategies employed by restaurants that offer delivery services compared to those that do not.

Building a flowchart comparison using both quantitative and qualitative sampling and analysis results in the development of two unique flowcharts:

Flowchart 1: Standard production process (customer order - payment - preparation - serving) for restaurants without delivery services.

Figure 1, flowchart for standard production process.

Flowchart 2: Production process incorporating food delivery (online customer order - preparation - packing for transport - rider call - payment - delivery) for restaurants with delivery services.

Figure 2, flowchart for food delivery production process.

These two flowcharts will be used to identify and note variations in restaurant setup, as well as to observe enhancements and changes in restaurant management because of the introduction of food delivery.

Results. It is reasonable to anticipate that the management of restaurants will undergo a significant transformation after the introduction of meal delivery services. The purpose of this study is to examine and compare the operational procedures of two various types of restaurants, where the first one offers a meal delivery service and another that does not offer such a service. We will use the restaurant that does not provide delivery service as a control group. This will allow us to identify differences in terms of operations, people management, supply chain management, and other managerial practices that may be different from one another.

We have developed two distinct flowcharts to simplify this study. The first flowchart is for restaurants that offer delivery service, and the second flowchart is for businesses that do not offer delivery service. Through the process of superimposing these charts onto the operational procedures of each restaurant, we will be able to identify variances readily and explicitly in the operations as well as potential areas of concern. Following that, these variations will be accurately documented in a comparative matrix using a methodical approach. With the use of this technology, we can directly compare the production processes of the two different types of catering and highlight elements that are particularly important.

We are anticipating the discovery of major differences, particularly in relation to the management of time. Restaurants that offer delivery services are required to coordinate their delivery schedules with those of the couriers, whereas restaurants that do not offer delivery services do not have to worry about this issue. In addition, we anticipate discovering essential issues affecting the preparation of products for delivery. These aspects include the utilization of innovative materials and specialized equipment for packaging, as well as thermal bags that are utilized for transportation. Restaurants that provide delivery services face an additional challenge because of these features, which have an effect not only on the operation of the business but also on the management of expenses.

Research limitations. The in-depth analysis of the significant impacts that meal delivery services have on restaurant operations, no matter how comprehensive it is, is exposed to many potential limitations that may affect the scope, depth, and generalizability of the findings. To the conduct of the accurate assessment of the findings of the research and providing the direction for further research in this area, the thorough understanding of these limitations is very important. It is likely that there will be constraints due to geographic and cultural differences. It is likely that the research fails to capture the variety of restaurant operations and consumer behaviors that are prevalent worldwide, especially when it looks at the Italian food delivery business or niche areas such as Quick Service Restaurants (QSR). Different regions may use different patterns, regulatory frameworks, and customer preferences that can influence the acceptability of food delivery services and their implications.

In a dynamic and evolving market, constraints are likely to be experienced. Information technology is growing in this sector very speedily and customer demand is the always new in the food delivery industry. This research may overlook the latest developments or pending trends that have the capacity of impacting restaurant business. Such examples include novel delivery methods, alterations of consumer tastes, and legal changes that have an impact on the food delivery system.

We can trust in the secondary data, because in case a research project is largely dependent on previously published literature and secondary data sources, the chances of the research running into limitations such as inaccuracy, irrelevance, and timeliness of the data are quite high. Due to the dynamic nature of the food delivery market, the information may be outdated, which could have been overlooked in previous research. Lucas et al., (2013) also point out that, given the diversity of business models, management styles and operational techniques that are employed in restaurants, one should focus on the diversity of management and operational practices in this field. This diversity might not be considered in the research, which could result in simplifying the complexities and nuances of how diverse types of

restaurants adapt and use the meal delivery services. Finally, there is the risk of having a major influence on the realization of financial objectives. The variable pricing structures, revenue models and commissions of the delivery platforms can make it difficult to understand the financial impact of implementing food delivery services. This happens because different delivery platforms have different commission rates. The study may not provide a good deal of the long-term financial viability and profitability of restaurants that adjoin a meal-delivery service.

Managerial implications. Other than giving informative that is very valuable to restaurant operators, managers and other stakeholders in the restaurant industry, the study, of the wide impact of meal delivery services on restaurant operations, has critical managerial implications. The impacts of integrating meal delivery services into traditional restaurant formats should be weighed to deal with the challenges and opportunities that the fusion of services brings about. Below we indicate the most important managerial implications derived from the research, along with available supplementary papers.

Strategically adapting, the restaurants' management must realize the requirement of integrating digital meal delivery services into their general business strategy. This does not only involve working with the third-party delivery services, but also improving their web presence and the digital ordering systems to make the customer experience more satisfying. Managers need thorough knowledge of the inherent intricacies of such platforms for them to use digital platforms in growing their customer base beyond the limitation of the physical location and seating capacity.

In the research conducted by A. R. and Devakumar P.S. (2021), the article referred to as *Online Food Delivery- A Solution for Upsurging Restaurant Business* examines the potential of restaurants making money by supplying the meals to the homes of the customers, thus avoiding the limitations that are usually associated with businesses.

Through the implementation of dual service lines and the enhancement of operational efficiency: The entry of meal delivery services calls for a rethinking of kitchen operations to effectively handle orders from both in-house dining and delivery. Managers were required to think about the layout of the kitchen reorganization, the use of modern technologies in order administration as well as the creation of separate service lines for delivery orders to ensure operation efficiency and excellent service across both channels.

The research conducted by P. Feldman, Andrew E. Frazelle, and R. Swinney (2021) titled "Managing Relationships Between Restaurants and Food Delivery Platforms: The paper "Conflict, Contracts, and Coordination" explores a number of approaches that can be applied to the development of service lines – in the context of food delivery systems – as well as financial models.

Re-evaluating the financial model, restaurant management needs to reconsider the financial model they have because delivery platform fees affect profitability. Thus, the assessment of profitability in cooperation with delivery providers, changing pricing strategy to accept commissions payments, as well as the development of tools to raise order value and customer loyalty through promotions and loyalty programs are the steps to be undergone.

The digital shift, which is happening in the restaurant business, emphasizes the need for restaurants to implement digital marketing approaches to enhance their presence in the market. A well-established online brand presence should be one of the key goals for managers, they can achieve this goal by using social media, search engine optimization (SEO), and targeted online advertising. In a competitive context, this technique can be instrumental in attracting new clients, retaining the clients you already have, and improving overall market penetration.

Success needs adaptation to the consumer's preferences and trends. Understanding the dynamics of the changing consumer's preference is critical, and so is the need for adjust to those preferences. This includes the creation of menu items that are conducive to delivery, the study of packaging innovations that sustain food freshness during transport, and the awareness of consumer interests in alternatives that are healthier, more sustainable, and locally sourced.

Focusing on the online meal delivery market, the article called "A Study of Customer Satisfaction with Online Food Delivery Applications" by Rapariya (2023) emphasizes the importance of reaching customer expectations.

Management implications brought about by the increasing meal delivery industry have highlighted the need of the strategic, operational, and financial changes to be implemented. Restaurant managers who are open to adopting these changes can deal with the challenges that the digital era brings in a more effective manner and can be competitive and profitable.

To be successful in a continuously changing digital food service environment restaurant managers need to carry out further research into these impacts. This will lead to deeper comprehension and sharper techniques.

Originality of the paper. The research is notable for its originality in several respects, particularly for its detailed assessment of the impact of food delivery services on the restaurant industry, with a focus on the Italian market and the Quick Service Restaurants (QSR) sector. The width of approach this research adopts for considering shifts in restaurant management practices, operational adjustments, and strategic changes, which are driven by the introduction of meal delivery services, is a major dimension of the novelty of this research. To demonstrate why this research is unique, the following reasons are provided, along with supporting articles which are relevant.

A unified view of digital revolution in food service in comparison with other studies that could have focused on individual parts of food delivery services, this research provides an integrated look at digital changes occurring in food service industry. It not only looks at the operational and managerial changes but also explores the strategic implications that restaurants will come across as they adapt to this new business model. A deeper understanding of the opportunities and challenges posed by the food delivery services can be achieved by using this broad-based approach.

Emphasis on Italian market and quick-service restaurant sector, the research brings a new layer of originality by studying the Italian food delivery market and its effect on fast-service restaurant sector. This allows to understand a

certain geographical context and industry segment. By having this focus, it is easier to conduct deeper research of the influences cultural, economic, and regulatory factors have on the adoption and integration of food delivery services in Italy. This study may give some ideas that are relevant to the other markets.

Paper in support of the argument: *The Work in the Gig Economy*. The research called “Evidenze dal mercato del food delivery in Italia” was published in 2018 by L. Rizzica and Cristina Giorgiantonio. This research offers an introduction to the Italian food delivery market and its effect on the economy and legislation setting.

A Comprehensive Analysis of the Changes in Operations and Dual Service Lines: This study is pioneering as it gives a detailed overview of the methods that restaurants are using to restructure their kitchen operations and service lines to cater for orders from both dine-in restaurants and delivery services. The study contributes new knowledge about the logistical shift that is required for victory in digital food delivery system. These new perspectives are emphasized by emphasizing the operational advantages and challenges, which are associated with dual service lines management.

The findings of the research in respect of how restaurants can “fix” economic problems of work with delivery platforms are a result of the research itself having examined digital marketing techniques and the reevaluation of financial models in response to food deliveries. This involves the application of new tactics in pricing, promotions and customer participation in the age of digital revolution.

This study is aimed at the way restaurants change their menu provisions and business model to cater for the demands of the food delivery market that are influenced by the changes in consumer preferences, and trends. The novelty of this research is in the fact that it studies how restaurants are changing their menu offerings and ways of doing business. Within the framework of meal delivery services, this aspect of the study highlights the dynamic interrelation between the behaviour of customers and the methods applied by restaurants.

Being concise, the peculiarity of this study consists in the complete analysis, the focus on certain regions and industries and consideration of ways, in which the introduction of food delivery services has impacted functions and strategies of restaurants. This research also helps in bridging a gap in the available literature and becomes a valuable material for the restaurant managers, owners, and lawmakers, in addition to providing some fresh insights and contributing to the academic and practical knowledge of the digital transformation in the food service industry.

Exploring Metaverse Adoption in High-Involvement Purchases: Insights from a field research

BEATRICE LUCERI¹ SIMONE AIOLFI² GIOVANNI ROMANO³

Abstract

The emergence of the Metaverse poses a new challenge within the digitalization process of brands and retailers. The proliferation of new technologies such as Extended Reality (XR), 5G networking, and Artificial Intelligence (AI) is laying the groundwork for creating this three-dimensional virtual world where users, through their avatars, can carry out their daily activities, including shopping. By making digital twins, companies can extend the purchasing process within these touchpoints, thus offering immersive digital interaction with their products. This study provides insights into the factors influencing consumers' intention to use Metaverse Technologies (MT) to support the purchasing process of high-involvement goods. Through a quantitative research approach using a structured questionnaire, a theoretical framework based on UTAUT was tested using responses from 103 lead buyers of a helicopter industry company, and PLS-SEM was employed. The findings reveal that performance expectancy and effort expectancy significantly impact usage intention. Likewise, a significant effect of perceived interaction quality on both performance expectancy and effort expectancy was found. Additionally, perceived curiosity was found to have an impact on effort expectancy. Theoretical contributions are provided, supporting the ongoing research stream on consumers' engagement intention in the Metaverse. Moreover, relevant managerial implications are presented, serving as guidelines for firms needing a clearer understanding of the marketing activities required to access this new virtual world.

Key words: *metaverse; high-involvement goods; usage intention; metaverse technologies; PLS-SEM; purchasing behavior*

Framing of the research. *There is significant buzz and interest surrounding the Metaverse (Dolata & Schwabe, 2023). The Metaverse is a 3D digital virtual world that extends beyond reality and is emerging as a transformative innovation. It allows users to interact via avatars, engaging their senses and facilitating various activities such as meeting with friends, working, shopping, building social and emotional relationships, attending concerts, meetings and events (Kozinets, 2023; Mourtzis et al., 2022). The term Metaverse was first introduced into science fiction literature in the 1990s by Stephenson (1992) and has since become part of scientific discourse (Park & Kim, 2022). Considered a new evolution of the Internet (Mourtzis et al., 2022), it refers to a virtual shared space created by the convergence of physical and virtual reality.*

Defining the Metaverse accurately is challenging due to its potential impact on various sectors, such as entertainment, education, shopping, and social networking. However, the commonly discussed Metaverse is a virtual world that resembles the real world and provides a space for users to interact with each other. According to Yoo et al. (2023) it is an online collaborative shared space consisting of 3D environments that use high consumer immersion techniques to reduce the perception of technological mediation; allows for the use of transferrable and unique digital assets; and enables user-generated digital personas to interact with each other. Essentially, the Metaverse is a combination of Virtual Reality (VR), Augmented Reality (AR), Extended Reality (XR), Blockchain, Artificial Intelligence (AI), 5G networking, Internet of Things (IoT), social media, and online gaming. It creates a seamless and immersive digital environment where users can interact, create, and transact.

Due to its characteristics, the Metaverse is expected to revolutionize daily activities and interpersonal engagements involving individuals, businesses, products, and services. Despite widespread interest and readiness to work on its construction, there is still much uncertainty surrounding its nature and potential adoption. The ultimate success and adoption of the Metaverse remain uncertain because of complexities and uncertainties surrounding issues such as privacy, data ownership, digital rights, and inclusivity (Dwivedi et al., 2022). Nevertheless, an increasing number of companies are investing in the Metaverse, and the global market size is expected to reach USD 840 billion by 2030, with around 1.5 billion users (Statista, 2023). Several reports indicate a growing interest in the innovative functionalities of

³ University of Parma
e-mail: giovanni.romano@unipr.it

virtual environments and digital platforms with 79% of consumers prefer to purchase physical and virtual goods in a virtual space (McKinsey & Company, 2022). Moreover, according to recent research by Osservatorio Extended Reality & Metaverse (2023), the Retail and Entertainment sectors dominate investments, accounting for 30% each.

Although the future of this virtual space remains unclear, it is evident that various interaction modalities and novel augmented touchpoints are emerging for brands, consumers, and retailers. All this has the potential to create significant value and strategically influence the customer experience throughout the pre-purchase, purchase, and post-purchase phases (Yoo et al., 2023). In light of this scenario, the aim of this study is to investigate the impact of Metaverse on retail experiences, specifically consumers' intention to use Metaverse Technologies (MT) when purchasing high-involvement goods for which the consumers' decision-making process is a complex problem-solving (Nayeem & Casidy, 2013).

Purpose of the paper

Theoretical background

Kozinets (2023) argues that the Metaverse plays a decisive role in transforming customer experiences and creating new opportunities in service relationships. Users engage in a variety of activities, including shopping, which can be experienced immersively through devices such as Head-Mounted Displays (HMDs). They can also purchase non-fungible tokens (NFTs) in the form of avatars, digital real estate, and digital artwork, and try out products by viewing and/or testing them within a Metaverse platform before making a purchase (Kozinets, 2023).

The early stage of development and dissemination of Metaverse emphasises the need to focus on factors that could influence their usage, providing insights into potential consumer behaviours. Several studies have examined the elements that affect individuals' willingness to engage with the Metaverse, with many concentrating on the educational context (Alfaisal et al., 2024). However, there appears to be a significant gap in the literature regarding consumers' intentions to use MT while shopping, particularly for high-involvement products. Consumers' decision-making process for such products is a complex problem-solving sequence that involves problem recognition, information search, brand evaluation and selection, purchase, and post-purchase evaluation (Nayeem & Casidy, 2013). Therefore, high-involvement buying decisions entail a significant level of financial risk and emotional investment for customers. The purchase of infrequent, expensive, and high-involvement products typically involves a learning process, necessitating detailed information, extensive research, comparison, and deliberation (Grewal et al., 2003; Kotler et al., 2007; Nayeem & Casidy, 2013). High-involvement purchases, such as buying a house, an automobile, or expensive luxury items like jewelry or designer clothing, often require a unique and emotional experience for customers (Grewal et al., 2003; Nayeem & Casidy, 2013).

Previous studies have identified several types of information sources that consumers consider trustworthy and reliable when making high-involvement purchases (Doran, 2002). The process of selecting information sources may include external sources, such as information from agents, family and friends, product trials, and research before making a final decision. The Internet also has a significant impact on several stages of the consumer decision-making process (Nayeem & Casidy, 2013). It is an efficient medium for accessing, organizing, and communicating information. Several studies discuss the role of digital technologies in stimulating high-involvement purchases (i.e., Sihi, 2018; Shen et al., 2021). For instance, Sihi (2018) explored the impacts of virtual reality (VR) and augmented reality (AR) technologies on the high-involvement purchase decisions of home-buying, emphasizing their role in enhancing consumer information search and evaluation of purchase alternatives. This study suggests that VR and AR technologies significantly impact consumer information search, evaluation of purchase alternatives, and the role of sales agents in high-involvement purchase contexts.

The potential of the Metaverse and its associated technologies to assist consumers in making informed purchasing decisions has been highlighted by Shen et al. (2021) and Dwivedi et al. (2022). This objective can be achieved by creating a virtual platform where customers can interact with the product, explore its features, and even simulate its use. Furthermore, enabling direct remote interaction with the seller during the trial phase is achievable. This, in turn, allows for assistance to be provided not only during the pre-purchase stage but also post-purchase. It also enables the involvement of other people in the shopping experience who can interact with the shopper throughout the purchase process. The Metaverse can incorporate digital twins and other interfaces embedded in the platform for a seamless operation and superior customer experience (Dwivedi et al., 2022). The concept of a digital twin has found wide applications in industries such as automotive, e-commerce, healthcare, manufacturing, and logistics. It is a virtual replica of actual operations that can help organizations minimize costs, prevent accidents, optimize planning, and allocate resources efficiently (Dwivedi et al., 2023; Papagiannidis et al., 2014). The digital twin enables the presentation of products in virtual spaces in an authentic and realistic manner, conveying product features through text, photographs, and videos. This facilitates the description of products and their usage (Papagiannidis et al., 2014; Dwivedi et al., 2022). For example, in the virtual world of the Metaverse, marketers can employ targeted strategies to appeal to customers during high-involvement purchases. This involves highlighting product features, benefits, and quality to alleviate concerns and build confidence in the decision-making process, both online and in physical stores. Creating virtual representations of products is a challenging task. However, a simulated experience in the Metaverse can enhance the shopping experience by increasing engagement, enjoyment, satisfaction, and purchase intention (Papagiannidis et al., 2014; Dwivedi et al., 2022).

Framework for High-Involvement Purchasing in the Metaverse

The aim of this study is to identify the factors that drive consumers' intention to use MT when purchasing high-involvement goods. The proposed framework for High-Involvement Purchasing in the Metaverse is based on the original UTAUT model (Venkatesh et al., 2003), incorporating the most relevant variables as depicted in Figure 1. The UTAUT model and its extended versions (Venkatesh et al., 2012) have been widely adopted in numerous studies for exploring consumer behaviors towards emerging technologies, including the Metaverse (i.e., Alkhwaldi, 2023). The proposed model considers three theoretical constructs from the UTAUT framework: Performance Expectancy, Effort Expectancy, and Social Influence. Additionally, variables such as consumer innovativeness, perceived interaction quality, and perceived curiosity are included.

Performance Expectancy is "the degree to which an individual believes that using the system will help him or her to attain gains in job performance" (Venkatesh et al., 2003, p.447). In the context of this study, this variable aims to determine the extent to which consumers believe that using MT can provide valuable support in their process of purchasing high-involvement products.

Effort Expectancy is a variable that measures "the degree of ease associated with the use of the system" (Venkatesh et al., 2003, p.449). It is crucial to evaluate MT's perceived ease of use, considering the potential barrier this dimension may pose. For instance, to interact in a highly immersive manner with a virtual world, consumers are required to wear devices such as HMDs.

Social Influence is "the degree to which an individual perceives that important others believe he or she should use the new system" (Venkatesh et al., 2003, p.451). In cases where adopting a particular technology is mandatory, such as for an upgrade of workplace technologies or when required by law, the effect of social norms is attributable to an individual's response in terms of conformity, thus resulting from a form of social pressure. When adoption choice is voluntary, social norms can influence how a technology is perceived. This can activate mechanisms such as internalization and identification (Venkatesh et al., 2003). This is relevant when adopting MT to support the process of purchasing high-involvement products.

The literature suggests that Performance Expectancy, Effort Expectancy, and Social Influence positively impact the intention to use a new technology (Venkatesh et al., 2012). Based on this, the following hypotheses are formulated:

H1: Effort expectancy positively affects the intention to use MT for high-involvement product purchases

H2: Performance expectancy positively affects the intention to use MT for high-involvement product purchases

H3: Social influence positively affects the intention to use MT for high-involvement product purchases

Consumer innovativeness drives individuals to try innovative and different products, often placing them as early adopters (Roehrich, 2004). The importance of an individual's openness to innovation in adopting new technologies has been extensively studied in marketing literature (Handarkho & Harjoseputro, 2020; Shanmugavel & Micheal, 2022). MT have the potential to revolutionise the consumer purchasing process, especially for innovative consumers. This creates an opportunity for highly innovative individuals to be more willing to experiment with these technologies. Thus, the following hypothesis is proposed:

H4: Consumer innovativeness positively affects the intention to use MT for high-involvement product purchases

The variable of perceived interaction quality assesses a user's belief in a computer system's ability to facilitate adequate interaction with the digital environment. It is important to interact with high-involvement products in a digital environment to gather necessary information for evaluation. Previous research has emphasized the role of perceived interaction quality in influencing the utilitarian aspect of consumer behavior (Kang et al., 2015; Nandi et al., 2021). Thus, it is considered an appropriate antecedent of the utilitarian variables in our model - performance expectancy and effort expectancy. Based on this, we propose the following hypotheses:

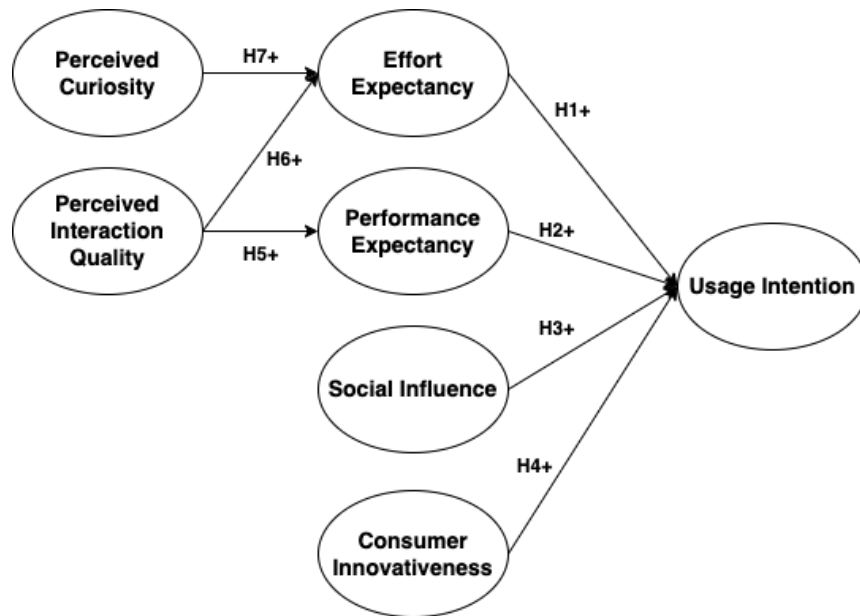

H5: Perceived interaction quality positively affects performance expectancy

H6: Perceived interaction quality positively affects effort expectancy

Perceived curiosity is "a desire to obtain and learn new information and knowledge that stimulates human behaviour to explore novel ideas" (Alkhwaldi, 2023). Several authors have included the variable to study the context of the Metaverse and in many studies is considered as an antecedent of the Effort Expectancy (Aburbeian et al., 2022; Alkhwaldi, 2023). Based on this, we propose the following hypothesis:

H7: Perceived curiosity positively affects effort expectancy

Figure 1 - Framework for High-Involvement Purchasing in the Metaverse

Methodology

Measures

An online survey was conducted to measure the variables of the proposed framework for High-Involvement Purchasing in the Metaverse using established and reliable scales sourced from the literature. The survey was aligned with prior research on the adoption of new technology (Aiolfi, 2023; Shukla & Sharma, 2018; Venkatesh et al., 2012) and to ensure reliability and validity, survey design adhered to specific protocols and guidelines (i.e., Evan & Miller, 1969; Kountur, 2011). Multiple-item scales informed by previous research in consumer behavior, technology adoption, psychology, and marketing theories were used to measure variables in the online survey. Adaptations were made to suit the study's dimensions. The Performance Expectancy scale was evaluated using Escobar-Rodríguez & Carvajal-Trujillo's (2014) 4-item scale. The Effort Expectancy was measured with 4-item scale derived from Venkatesh et al. (2003), and Social Influences were assessed using the 3-item scale by Venkatesh et al. (2012). Consumer Innovativeness was assessed with 4 items-scale by Parasuraman & Colby (2014); Perceived Curiosity and Perceived interaction quality were measured using 3-points scales derived respectively from Agarwal & Karahanna (2000) and Kim & Ko (2019). Finally, Usage Intention was measured using a 4-item scale as utilized by Ramos-de-Luna et al. (2016). Participants used self-anchoring scales from 1 to 7 points to express agreement or disagreement with statements, from 'Strongly Disagree' (1) to 'Strongly Agree' (7).

Sample and data collection

The Microsoft Form platform was used to design and distribute the questionnaire online. Administration was carried out through direct mail, targeting lead buyers of an Italian helicopter industry company who had shown interest in the product during trade fairs or through the company's website contact form. The survey began by presenting the scenario in Figure 2.

Figure 2 - Survey scenario

Imagine being interested in purchasing a *Company's Brand* helicopter. The company offers you a cutting-edge service: access to a virtual environment in the Metaverse, where you will have the opportunity to:

- Explore a faithful digital replica of the original *Company's Brand* helicopter;
- Analyze in detail the internal and external structure of the vehicle;
- Conduct virtual test drives, experiencing control as if you were physically at the helm;
- Receive assistance from an aviation industry expert, represented by an avatar, who will accompany you in all these activities.

All of this without the need to visit the company, allowing you to connect remotely from wherever is most convenient for you. Now, we invite you to read the following statements and express your level of agreement or disagreement

A hyperlink included in the email invited recipients to participate in the study, redirecting them to the form page for completion. Data collection took place between January and February 2024. The questionnaire was available in both

Italian and English to accommodate the participation of the company's clients from countries other than Italy. A total of 580 lead buyers were present in the Company's database and were contacted. Finally, 103 questionnaires were collected, resulting in a response rate of 17.76%. The sample consisted of 90.3% men and 8.7% women, with an average age of 53 years. The sample characteristics are shown in Table 1.

Table 1 - Sample Characteristics

Group	Frequency (N=103)	Percentage (%)
Gender		
Man	93	90.3
Woman	9	8.7
n/c	1	1.0
Age		
< 26	1	1.0
26-35	7	6.8
36-45	15	14.6
46-55	38	36.9
56-65	27	26.2
≥ 65	15	14.6
Education		
High school or below	9	8.7
Bachelor's degree	35	34.0
Master's degree or above	59	57.3

Results. The study employed the Partial Least Squares Structural Equation Modeling (PLS-SEM) approach and the SmartPLS 4.0.9.6 software to analyze the proposed Framework for High-Involvement Purchasing in the Metaverse (Abdi, 2007; Fornell & Bookstein, 1982; Ringle et al., 2024). PLS-SEM was selected because of its ability to evaluate intricate structural equation models and analyze correlations between variables, particularly in situations where the distribution is non-normal and the sample size is not large, or at least 10 times the maximum number of indicators of a latent variable (Hair et al., 2011). To ensure the reliability and convergent validity of each construct, we evaluated the adequacy of individual items and composites. Convergent validity of measures was tested by examining the significance of factor loadings and composite reliability. The measurements presented in Table 1 demonstrate satisfactory results in terms of both convergent and discriminant validity. This is evidenced by the factor loadings, rho_A, and AVE, which were either above or very close to the 0.70 threshold. Additionally, Cronbach's alpha and rho_A exceeded the cut-off points of 0.70, indicating internal consistency reliability (Dijkstra & Henseler, 2015; Hair et al., 2022; Santos, 1999). The AVE values were all above 0.50, indicating acceptable convergent validity (Sarstedt et al., 2022). Additionally, the HTMT ratio values in Table 2 were all below the threshold of 0.85, indicating discriminant reliability (Henseler et al., 2015).

Table 2 - Reliability and validity tests

Construct	Cronbach's α	rho_A	AVE	Mean(SD)
Performance Expectancy (PE)	0.955	0.956	0.880	4.55 (1.48)
Effort Expectancy (EE)	0.945	0.947	0.859	4.40 (1.45)
Social Influences (SI)	0.945	0.947	0.902	3.57 (1.61)
Consumer Innovativeness (CI)	0.921	0.927	0.811	4.56 (1.49)
Perceived Curiosity (PC)	0.967	0.967	0.938	5.24 (1.49)
Perceived Interactivity Quality (PIQ)	0.919	0.921	0.862	5.23 (1.36)
Usage Intention (UI)	0.979	0.979	0.942	4.67 (1.67)

Table 3 - Heterotrait-monotrait (HTMT) ratio

	CI	EE	PC	PE	PIQ	SI	UI
CI							
EE	0.833						
PC	0.635	0.730					
PE	0.643	0.816	0.783				
PIQ	0.579	0.780	0.827	0.817			
SI	0.751	0.841	0.679	0.811	0.749		
UI	0.649	0.853	0.866	0.913	0.847	0.789	

To evaluate the proposed framework, we used PLS-SEM due to its proficiency in analyzing variable correlations and evaluating intricate structural equation models. The bootstrap procedure was conducted using Smart PLS 4.0.9.6 software with 5000 bootstrap samples. We applied a bias-corrected 95% confidence interval and accelerated bootstrap method for model analysis. Table 3 presents the synthesized findings of the main effects. The results support H1 and H2, as effort expectancy ($\beta=0.372$, $P<0.000$) and performance expectancy ($\beta=0.597$, $P<0.000$) exerted positive and significant effects on usage intention. Additionally, perceived curiosity ($\beta=0.332$, $P<0.006$) was found to be positively related to usage intention, supporting H7. The study found that social influences ($\beta=0.050$, $P>0.05$) and consumer innovativeness ($\beta=-0.068$, $P>0.05$) did not have a significant effect on usage intention, therefore H3 and H4 were not supported. Furthermore, perceived interaction quality had a positive and significant effect on performance expectancy ($\beta=0.765$, $P<0.000$) and effort expectancy ($\beta=0.471$, $P<0.000$), thereby supporting H5 and H6.

Table 4 - Results of hypothesis testing

Hypothesis	Coefficients	S.E.	P	Results
H1: EE → UI	0.372***	0.102	0.000	Supported
H2: PE → UI	0.597***	0.079	0.000	Supported
H3: SI → UI	0.050	0.095	0.598	Not Supported
H4: CI → UI	-0.068	0.078	0.384	Not Supported
H5: PIQ → PE	0.765***	0.049	0.000	Supported

Theoretical and Managerial implications. The obtained results can provide valuable insights to support the actions of businesses intending to extend the sale of high-involvement goods to the Metaverse. The significance of effort expectancy and performance expectancy in explaining usage intention confirms previous findings in the literature, emphasizing the importance of the utilitarian dimension for consumers in their technology adoption journey. This is also applicable to sales management conducted through the Metaverse. It is crucial to carefully assess the User Experience within the virtual environment to ensure ease of use and utility in supporting the purchasing process. To effectively reduce the effort involved in purchasing high-involvement goods, delivering an experience that highlights the appropriate level of immersion required when designing the virtual experience is necessary. Therefore, it is important to evaluate whether XR technologies, such as Head-Mounted Displays, can meet this requirement or if a two-dimensional virtual world accessible via a normal screen would be more suitable.

Thereafter, to support the Metaverse in terms of service relationships, companies could leverage the improved quality of interaction it offers. The potential for seamless engagement within the digital realm should extend beyond product interaction alone. It should encompass the accessibility of a sales representative for enhanced interaction, thereby augmenting the utility of the Metaverse in both pre- and post-purchase stages. For instance, the capability of immersive interaction could be showcased by enabling product testing opportunities during trade shows or other physical product exhibitions. By accessing the Metaverse through a Head-Mounted Display (or even a PC or smartphone) and offering guidance on navigating such environments, the true capabilities of these tools would be demonstrated.

Furthermore, consumer innovativeness did not emerge as a significant variable. This suggests that the level of digitalization is already high enough that consumers do not view the Metaverse as a disruptive innovation. Therefore, it

is not necessary to exclusively focus on that particular segment to enhance this experience. However, it is possible to direct the testing of such technologies towards customers who express greater curiosity in them. It is feasible to collect expressions of interest through a company's online channels, such as their website or social media, to offer test versions concurrently with assistance for their utilization, both remotely and in-person.

Research limitations. The research provides significant contributions to the adoption of the Metaverse theme, yet it also presents limitations. Firstly, the still-emerging nature of the Metaverse phenomenon may necessitate further exploration. Through qualitative research, it would be possible to uncover new relevant dimensions and variables in explaining consumers' intentions to use the Metaverse. Furthermore, this research aimed to focus on high-involvement goods by analyzing the market of a helicopter company. Extending the investigation to other sectors (e.g., automobiles, yachts) could enhance the generalizability of the model's variables and allow for comparisons across different sectors, leveraging a more diverse and extensive sample. Finally, since usage intention was analyzed, future studies could include use behavior as well, targeting sectors and consumers already using MT to support the purchasing process to conduct a more comprehensive analysis of the model by incorporating use behavior, as in the original UTAUT framework proposed by Venkatesh et al. (2003).

Originality of the paper. To the best of our knowledge, this research is among the first to explore the key factors that may lead consumers to consider using the Metaverse for shopping. Specifically, this study is the first to examine the intention to use it to support the purchasing process of high-involvement goods. The findings have addressed the gap in the literature by applying the proposed model, based on the UTAUT model with additional consumer-related variables, thus investigating its applicability to the adoption of this technology. The proposed framework for High-Involvement Purchasing in the Metaverse was able to extract valuable insights into consumer behavior towards the new scenario offered by the Metaverse and the enabling technologies thereof.

Word of mouth vs. word of machine: a preliminary analysis

GRAZIANO ABRATE¹ VALERIA FARALLA²

Abstract

The present paper describes an ongoing research project aiming at exploring the managerial implications of integrating Artificial Intelligence (AI) in the analysis of hotel reviews, both textual and numerical. The strategic incorporation of AI technology has seen significant growth across various management domains. In the hospitality sector, the availability of big data also facilitates applications of machine learning in the management of online reviews. This work focuses on the role of the so called “word of machine” as an alternative to the “electronic word of mouth” (eWOM) which has dominated hotel reviews in recent years. To this respect, a large body of literature has demonstrated that consumers use feedbacks from previous users in the form of eWOM because they reduce their uncertainty. At the same time, researchers have disagreed on which eWOM metric is the most influential on consumer behavior and firm sales. In parallel to human-based recommendations, the rapid development and adoption of AI has transformed and is transforming today’s marketplace, where new forms of recommendations based on AI are pervasive.

Building on these premises, the paper proposes a comparison of eWOM and AI based recommendations, namely between numerical ratings given by a consumer in online reviews with the numerical ratings that AI would assign to the textual review provided by the same consumer, contributing to the literature that compares human based recommendations with AI based recommendations. The goal is to shed light on the coherence (or not) between textual and numerical reviews and on the potential of AI tools in predicting human suggestions.

Preliminary findings, based on a pilot sample of 40 hotels in Rome and London, suggest that ChatGPT evaluates customer ratings differently when compared to direct ratings given by the customers in their reviews of hotels, as it is able to predict the exact score only in about one case out of three. Results are consistent across Italian and English languages. Results do not necessarily imply inefficacy of AI assessment, since there could be a bias in how customers represent their text reviews with a rating, leading to over- or underestimation compared to their textual assessments. The ongoing research project includes a second step based on experimental analysis, which may better explore whether such result is due to consumer bias. Moreover, experimental scenarios will allow to study the relative importance of different types of human based and AI based recommendations on consumer preference and purchase intention.

Technology facilitates real-time monitoring of reviews, enabling managers to derive actionable recommendations for optimizing brand positioning and competitiveness. This data-driven approach empowers informed decision-making and enables proactive service management. Furthermore, this paper contributes to the expanding literature on AI applications in industry sectors, offering practical recommendations for all the stakeholders involved.

Key words: artificial intelligence; ChatGPT; online reviews; textual; numerical; hospitality sector

Framing of the research. *Since the advent of the Internet, a large body of literature has been developed around the concept of electronic word of mouth (eWOM), as a web-based evolution of the traditional concept of word of mouth based on oral communication that “provides a mechanism to shift power from companies to consumer” (Hennig-Thurau, Gwinner, Walsh, & Gremler, 2004). Previous research has demonstrated that consumers use feedbacks from previous users in the form of eWOM because they reduce their uncertainty. For example, some studies have focused on the way online reviews affect purchase intention (e.g. Mauri & Minazzi, 2013); other authors have emphasized that better review ratings, by enhancing product reputation, lead to higher price levels (e.g. Abrate & Viglia, 2014). Babic Rosario, Sotgiu, De Valck, & Bijmolt (2016) showed the existence of a positive effect of eWOM on sales in different platform and product contexts, by providing a comprehensive meta-analysis covering 96 previous empirical studies. At the same time, they emphasize that eWOM has been proxied by different metrics in empirical analysis, and researchers have disagreed on which metric is the most influential. Moreover, while several analyses used numerical data (such as review ratings, and/or volume), other authors have highlighted the role of text (as well as other forms of user generated contents). Ghose & Ipeirotis (2010) analyzed the importance of text style, in terms of subjectivity, informativeness, readability, and linguistic correctness. Hu, Koh, & Reddy (2014) emphasizes the role of online review sentiment, suggesting that numerical ratings*

¹ University of Piemonte Orientale
e-mail: graziano.abrate@uniupo.it

² University of Piemonte Orientale
e-mail: valeria.faralla@uniupo.it

may not always be consistent with text sentiments and a sequential decision-making process may better describe the impact of numerical and textual components of reviews. The recognized impact of eWOM on firm's performance also stimulated research regarding online reputation management strategies. According to Proserpio & Zervas (2017), the practice of publicly responding to consumer reviews has emerged as a popular reputation management strategy, which can positively impact of review ratings at the cost of fewer but more detailed negative feedbacks. This implies a trade-off for managers: by responding they can expect to prevent some users to leave a negative review (with the result of inducing a higher average rating), but some users will be even more motivated to leave longer and detailed negative reviews because they know that their reviews will be read and examined. The way eWOM is evolving in modern marketplace has been recently investigated also in a special issue of the *Journal of Business Research* (Liu, Jayawardhena, Shukla, Osburg, Yoganathan, 2024).

In parallel to human-based recommendations, either in the form of traditional or electronic word of mouth, the rapid development and adoption of artificial intelligence (AI) has transformed and is transforming today's marketplace, where new forms of recommendations based on AI are pervasive. Longoni & Cian (2022) have introduced the term "word of machine", providing evidence that people believe AI recommenders are more (less) competent than human recommenders to assess utilitarian (hedonic) attribute value, and, as a consequence, "individuals are more (less) likely to choose AI recommenders when utilitarian (hedonic) attributes are important or salient" (Longoni & Cian, p. 92). They also stress that such word of machine effect depends on beliefs that do not necessarily correspond to the reality: humans are not necessarily less competent than AI at assessing utilitarian attributes, neither AI is necessarily less competent than humans at evaluating hedonic attributes. Similarly, Chen, Li, Liu, & Wang (2023) have focused their analysis on the effectiveness of AI chatbot in the context of purchasing search vs. experience products. Their findings highlight that AI chatbot can trigger higher purchase intention than human in the context of search products, while the opposite happens in the case of experience products.

Additional related literature includes the work of Hernández Ortega & Lucia-Palacios (2023), who introduced the term "word of voice" by exploring the role of smart voice assistants (SVAs) as purchase recommenders. Furthermore, Paul, Ueno, & Dennis (2023) have discussed the multidimensional benefits and potential pitfalls of using AI based on Chat Generative Pre-trained Transformer (ChatGPT). Resistance to the use of algorithm advice is well documented in the context of human resource selection, even if they are helpful to make better decisions (Rabinovitch, Budescu, & Meyer, 2024), as well as in healthcare services (Zhang, Tan, & Lee, 2024). Hollebeek, Menidjel, Sarstedt, Jansson, & Urbonavicius (2024) also explored the impact of AI on consumer engagement.

Overall, the comparison between human and AI recommendations and, more in general, the way consumers and AI interact, has opened a new intriguing stream of research, calling for novel cross-disciplinary theoretical approaches and methodologies (Pentina, Xie, Hancock, & Bailey, 2023).

Purpose of the paper. The ongoing research project described in this paper stems from the goal of comparing the way different form of human and AI-based recommendations may influence consumer behavior. The research focuses on the hospitality sector, where both utilitarian and hedonic values are recognized as important in travelers' assessments (Kim, Kim, Jhang, Doust, Chan, & Badu-Baiden, 2023), the use of eWOM is well established and a large amount of data is easily available through online platforms (such as, for example, TripAdvisor, booking.com). In particular, the research involves (at least) two steps:

- the first step is based on secondary data collection and focuses on the comparison between textual and numerical components of eWOM and on the efficacy of AI in predicting the numerical ratings from a textual input. Such research aims at establish, on the one hand, the coherence (or not) between textual and numerical reviews, and on the other hand, the potential of AI tools in predicting human suggestions. Apart from investigating the average consistency of textual and numerical contents, the research also aims at exploring which factors can affect AI prediction errors.
- the second step is based on experimental analysis, and aims at establishing the relative importance of different types of information on consumer behavior (textual vs. numerical components of online reviews and human-based online reviews vs. online reviews derived from AI tools).

The present manuscript focuses on the first step, describing some preliminary evidence based on a pilot sample. The main purpose of this paper is to investigate the impact of AI-driven review analysis on hotel management practices and, more generally, decision-making processes. Additionally, the study aims to assess the potential benefits and best practices associated with integrating artificial intelligence tools, such as ChatGPT, into the analysis of reviews within hotel management. This investigation is closely tied to customer relationship management within the hospitality industry.

Methodology. The dataset was obtained from booking.com, a widely used online hotel reservation platform known for its extensive collection of hotel listings, customer reviews, and user ratings worldwide. Ten customer reviews and respective ratings were selected for 20 three- and 20 four-star hotels. Half of the hotels were in Rome and the other half in London. We chose Rome and London because they are prominent cities and wanted to evaluate ChatGPT recommendations for Italian, our mother language, and English, a global language. For Rome, we selected reviews based on top choices, Italian language, and most recent reviews. For London, we selected reviews based on top choices, English language, and most recent reviews. Given that the reviews on booking.com include both a positive and negative textbox, we selected cases where the reviewer filled in both positive and negative comments. Hotels with insufficient reviews were excluded from the database.

The database was created using a three-step process. First, we included the 400 textual and numerical reviews by Booking.com customers. Then, we provided ChatGPT with the text reviews of the hotels and asked it to assign a numerical rating from 1 to 10 (where 1 is negative and 10 is positive) based on the content of each review. Third, we provided

ChatGPT with the textual reviews for each hotel, consisting of 10 reviews per hotel, and requested it to generate a concise summary within a 400-character limit for each hotel.

The textual (summary) reviews generated by ChatGPT are intended for use in an experiment where a sample will evaluate the hotel recommendations produced by ChatGPT. These reviews are not included in the present report but will be used in a subsequent laboratory experiment. This study is indeed an ongoing research project. The design of the laboratory experiment will comprise two treatments. In both treatments, participants will receive a textual and a numerical review, obtained from ChatGPT, for each of the 20 hotels (Italian and English languages will continue to be separately tested). Specifically, the summary review for each hotel will serve as textual review, while the average rating (from 1 to 10) assigned by ChatGPT (based on the ratings provided by ten customers on Booking.com for each hotel) will be considered as the numerical review. However, in one of the two treatments, subjects will be specifically informed that the reviews were generated by an Artificial Intelligence, namely ChatGPT, while the other treatment will not provide this information. A pre-registration of the study design will be conducted to ensure transparency and consistency in the experimental procedure.

We utilised ChatGPT3.5 for this task (accessed in February 2024). ChatGPT-3.5, as defined by itself, “is a variant of the GPT-3 (Generative Pre-trained Transformer 3) model developed by OpenAI. GPT-3.5 is an advanced language model capable of generating human-like text based on the input it receives. It builds upon the architecture and capabilities of its predecessor, GPT-3, with improvements in various aspects such as language understanding, coherence, and generation of contextually relevant responses”. Also, “ChatGPT-3.5, like its predecessor GPT-3, is based on a transformer architecture. Transformer models have revolutionized natural language processing (NLP) tasks by their ability to capture long-range dependencies in text data efficiently. The transformer architecture relies heavily on attention mechanisms, allowing the model to weigh the importance of different words or tokens in a sequence when processing input data. This enables the model to capture complex patterns and dependencies within the text, making it particularly effective for tasks such as language understanding, text generation, and translation. GPT-3.5, being based on this transformer architecture, inherits its capabilities and improvements from advancements made in the field of deep learning and NLP. The model is trained using a massive amount of text data, enabling it to learn rich representations of language and produce coherent and contextually relevant responses to a wide range of input prompts.”

Preliminary results. The mean rating estimated by ChatGPT for Rome hotels was 6.81 ($sd = 1.32$, $min = 2$, $max = 9$, median value = 7), whereas for customer ratings, the average value was 7.51 ($sd = 1.90$, $min = 1$, $max = 10$, median value = 8). ChatGPT rating is lower by about one percentage point ($p < .001$; Mann-Whitney U test).

For London, ChatGPT mean rating was 6.58 ($sd = 1.57$, $min = 1$, $max = 10$, median = 7), whereas customer mean rating was 7.57 ($sd = 1.82$, $min = 1$, $max = 10$, median = 8). Again, the difference was around one percentage point in the same direction ($p < .001$), indicating a certain consistency between the two language sets.

Also, 28% of customer ratings corresponded to ChatGPT ratings for Rome (56 out of 200; $p < .001$; one proportion z-test against 50–50 expected distribution). This percentage lowered to 23.5% (47 out of 200) for London ($p < .001$). This suggests that ChatGPT is able to precisely predict customer ratings from the text of reviews in about 1/3 of the cases.

The next step of the research is extending the dataset to explore if results remain consistent and to investigate the factors affecting the degree of AI prediction errors.

Overall, these preliminary findings suggest that ChatGPT evaluates customer ratings differently when compared to direct ratings given by the customers in their reviews of hotels. In both language sets, ChatGPT tends to assign lower ratings, and the difference is significant. This raises the possibility that ChatGPT may have difficulty interpreting customer text reviews accurately. However, the result might also highlight the presence of a bias in how customers represent their text reviews with a rating, leading to over- or underestimation compared to their textual assessments (Kahneman, 2012). This should be investigated further in future research.

Research limitations. The first premise is that the study is in a very preliminary phase, and the results here presented are obtained with reference to a small sample of data. ChatGPT did not systematically provide the same rating during data collection when given the same review. We have decided to take the first rating provided for consistency. Additionally, we have observed differences in ratings obtained in February compared to attempts made with a few reviews in December. The model's training data could influence this. Furthermore, when asked to summarise within the 400-character limit, ChatGPT did not always consistently adhere to the limit. On a few occasions, it happened that after repeated requests to respect the limit, ChatGPT froze and repeated the same statement without adhering to the limits. At the same time, potential risks associated with ethical and privacy considerations related to the use of AI technology can be considered as well.

Managerial implications. The managerial implications are primarily concerned with the use of AI in the area of online reputation management. AI provides a powerful tool that can assist hotel managers in identifying trends and patterns in guest preferences, thereby providing valuable insights to prioritize areas for improvement with the ultimate goal of improving guest satisfaction and business performance. For example, AI can help to classify and rank reviews not only by means of numerical scores, but also by textual contents, as the two dimensions might not always be coherent. Overall, this can improve the ability of hotel managers in profiling different groups of reviewers and customers.

At an aggregated level, online review platforms (such as booking.com) may consider to complement the information regarding average numerical scores with short textual summaries of reviews, generated by AI from an overall content analysis of the various reviews. To this end, AI's ability to analyze large volumes of reviews in real-time would be critical

in facilitating prompt adjustments and improvements. Moreover, it is important to understand if customers would trust such AI based recommendation.

Since the analyzed case study concerns the hospitality sector, implications are intended to hotel managers and operators, but might as well extend to other products and e-commerce platforms.

Originality of the paper. The paper proposes a comparison of numerical ratings given by a consumer in online reviews with the numerical ratings that AI would assign to the textual review provided by the same consumer. First, this allows to explore the relationship, and the coherence, between two dimensions of eWOM (textual and numerical) that have been often analyzed separately in previous literature. Second, by employing AI such as ChatGPT to predict the score of human textual comments, this work fits into the recent strand of the literature that compares human based recommendations with AI based recommendations. To this extent, the findings are the basis for a second step of the project, that will complement the current analysis with an experimental approach focusing on the way different types and dimensions of recommendations are perceived and used by individuals during their decision-making process.

Promoting (un)conscious purchasing behaviors and choices in favor of sustainability

SILVIA BELLINI¹ CHIARA BACCHILEGA² DAVIDE PELLEGRINI³ SIMONE AIOLFI⁴

Abstract

Proposing itself with a deliberately provocative title, this work intends to understand what are the most effective actions to transform sustainable choices into consolidated habits, paradoxically "unconscious", i.e. automatic, without cognitive effort or sacrifice. Sustainability is investigated through an interpretation linked to the behavior of demand, starting from the basic assumption that without an active contribution from demand, the efforts made by companies could be in vain. In order to play an active role, however, it is essential that consumers are enabled to access a sustainable offer, especially in the points of sale where consumption choices translate into behaviours. The connection between intentions and actions, however, is not at all obvious when talking about complex choices for which willpower alone is not sufficient. This is why we resort to "nudging", the gentle push which through the information architecture and the structure of choice helps the individual to make sustainable choices effortlessly, reducing the gap between "saying" and "doing". Measuring this gap and starting a strategic reflection on the most effective tools to promote sustainable choices and behaviors are the specific objectives of this work.

Keywords: sustainability; shopper marketing; conscious purchases; nudging; choice architecture.

Framework of the research. *Many issues related to globalization has brought sustainability to the forefront of 21st-century discourse (Schaefer & Crane, 2005). The term "sustainability" began to appear in academia in the 1980s, but has evolved considerably since then (Portney, 2015): initially used to exclusively identify the scarcity of natural resources (Kuhlman & Farrington, 2010), it has now expanded to three pillars: social, economic, and environmental sustainability (Purvis et al., 2018). Despite sustainability being one of the main objectives pursued by the United Nations through the creation of the Sustainable Development Goals (SDGs) (Whittingham et al., 2023), the efforts made to achieve these objectives are insufficient (United Nations, 2023). Several authors (Sheth et al., 2011) have considered the responsible behavior of individuals as a powerful driver of sustainable development and even though consumers look for companies that reflect their values (Anuradha et al., 2023), few opt for more sustainable behaviors, especially if they have to pay higher prices or accept reduced performance (Olson, 2013). For this reason, companies have begun to employ marketing strategies that encourage consumers to make sustainable choices (Anuradha et al., 2023).*

Given that improving consumer behavior involves targeted interventions in points of sale (Wansink, 2017), the latter become fertile ground for industrial and commercial companies to use shopper marketing levers in a sustainable manner to push shopping choices towards products that have a positive impact on both people and the planet. From this perspective, shopper marketing, defined as a set of actions aimed at influencing the individual during his decision-making process (Shankar, 2011), has social value when directed towards promoting conscious and sustainable consumption choices (Bellini, 2023). Including the path-to-purchase in interventions that support health confirms the centrality of the distributor and accredits the point of sale as a context dedicated to value creation (Yoder et al., 2021). The effectiveness of this approach, however, is by no means expected as it presumes a paradigm shift where the ratio of traditional economics co-exists with the principles of behavioral economics borrowed from cognitive psychology and neuroscience.

Sustainable choices are not easy to make nor, above all, to carry on stably in the long term as they require a cognitive effort that eludes conscious control and surrenders in the face of a willpower that is by definition not inexhaustible. Behavioral economics tools are useful in these situations as they can better grasp the mental mechanisms that regulate the decision-making process and guide individuals towards solutions that enhance their well-being, both individually and collectively.

In this context, the promotion of sustainable behaviors is increasingly a key area of application for nudging (Bergram et al., 2022). Nudging, defined by Thaler and Sunstein (2008) as “any aspect of the choice architecture that alters people's behavior in a predictable way without forbidding any options or significantly changing their economic incentives” originates from the concept according to 95% of the choices made daily are not rational (Bargh et al., 2001; Caraban et al., 2019), but the result of the application of heuristics and mental shortcuts that support the decisions making by reducing the necessary efforts to process information (Shah & Oppenheimer, 2018; Caraban et al., 2019). The literature on the application of nudging in the field of sustainability is expanding (Mont et al., 2014; Lehner et al., 2016; Trewern et al., 2021; Mirbabaie et al., 2022) and nudges are increasingly recognized as important and effective tools for promoting society's sustainable behaviors. Despite some limitations, their advantages appear to outweigh those of traditional marketing strategies (Gonçalves et al., 2021).

The effectiveness of nudging for sustainability has its roots in the “intertemporal” nature of sustainable choices (Thaler & Sunstein, 2008). Many sustainable behaviors require a sacrifice today in exchange for a future benefit, which is not guaranteed and may not necessarily fall within an individual's sphere. The misalignment between (individual) sacrifices and (collective) benefits, together with the absence of immediate feedback, makes sustainable choices difficult to make and often constitutes a disincentive to long-term stability. Nudging can best demonstrate its effectiveness in this area since it acts on individuals' emotions, which are more reactive in such situations where willpower is reduced due to uncertainty and difficulty in quantifying personal return.

The existence of a gap between 'intentions' and 'behaviors' (Sheeran & Webb, 2016) highlights the volatility of willpower and the necessity of nudges to guide individuals towards “unconsciously” preferring more sustainable options. The ultimate goal of nudging is to ensure that socially optimal choices are made effortlessly and gradually transform into consolidated habits. This should also be the final goal of companies that must promote “gentle nudges” towards their shoppers in points of sale.

Purpose of the paper. This work intends to measure the ability of retailers to effectively promote sustainable behavior on the demand front, starting from the hypothesis that, if a retailer is a “good nudger”, its customers will have a reduced intention-behavior gap, i.e. it will be composed of aware individuals who declare to and buy sustainable. Through the analysis of the sustainable profile of consumers, we will therefore try to understand to what extent the points of sale and shopper marketing strategies used in a “nudging” optic impact on sustainable choices and contribute to reducing the intention-behavior gap. The underlying reflection, which inspires the entire research path, is to understand what factors stimulate sustainable purchasing choices and how such choices, repeated over time, can turn into sustainable behaviors in favor of the planet and people, even outside the shopping context.

Methodology. Investigating sustainability is a complex methodological challenge as it requires the a priori identification of criteria and parameters useful for defining what is sustainable from the point of view of the demand and businesses. We land on a ground that is undergoing profound transformations, also from a regulatory point of view, which does not yet have a defined border or standard languages. In order to employ a methodology that is as robust as possible and based on objective elements, we relied on the NielsenIQ (NIQ) databases from which we obtained timely and statistically significant information both on the demand front, through the Consumer Panel, and on the offer front, through Retailer Measurement Service (RMS) data which will help us interpret the insights collected from interviews administered to retailers. The research therefore develops along two tracks.

On the **demand side**, consumers are mapped based on their sustainable purchasing behavior using socio-demographic, attitudinal, and behavioral profiling. The Consumer Panel (CP) of NielsenIQ (NIQ) is used as a tool to collect information from syndicated surveys and data on the real purchasing behavior of sustainable products, measured through the classification of the Imagino database (NielsenIQ and GSI Italy). The panel gathers data from more than 9,000 families, which are representative of the Italian population and are periodically interviewed about their socio-demographic characteristics and actual purchasing behavior. The interviews, conducted through the panel, enable the collection of data solely related to the topic of interest, following a 'single source' approach. This means that the families who answer the questionnaires are the same ones who record their purchases. In this way, panelists can be segmented using socio-demographic variables, based on their actual purchasing behavior (and not declared), and on their declared attitudes.

For the purposes of this research, the segmentation on the CP classifies families according to two parameters:

- what they claim to do in general with respect to sustainability (dimension of “saying” - intentions), identified through a set of specific questions aimed at measuring the attitude towards different areas of individual (nutrition), social (community and territories) and environmental well-being;
- what they buy, identified through the share of products in their cart with a specific set of attributes related to sustainability (dimension of “doing” - behaviors).

Individuals are measured based on their purchasing behavior of sustainable baskets. These baskets are identified by NIQ through the selection of products that convey the three specific declinations of sustainability: individual well-being, environmental well-being, and social well-being.

The analysis of the demand will be complemented by an **analysis of the supply** through the administration of a structured questionnaire aimed at mapping the “sustainable” profile of retailers based on shopper marketing actions aimed at promoting conscious purchases and behaviors in the areas of individual, social and environmental well-being. Specifically, each company will be studied with respect to:

- corporate governance (commitment and disclosure)

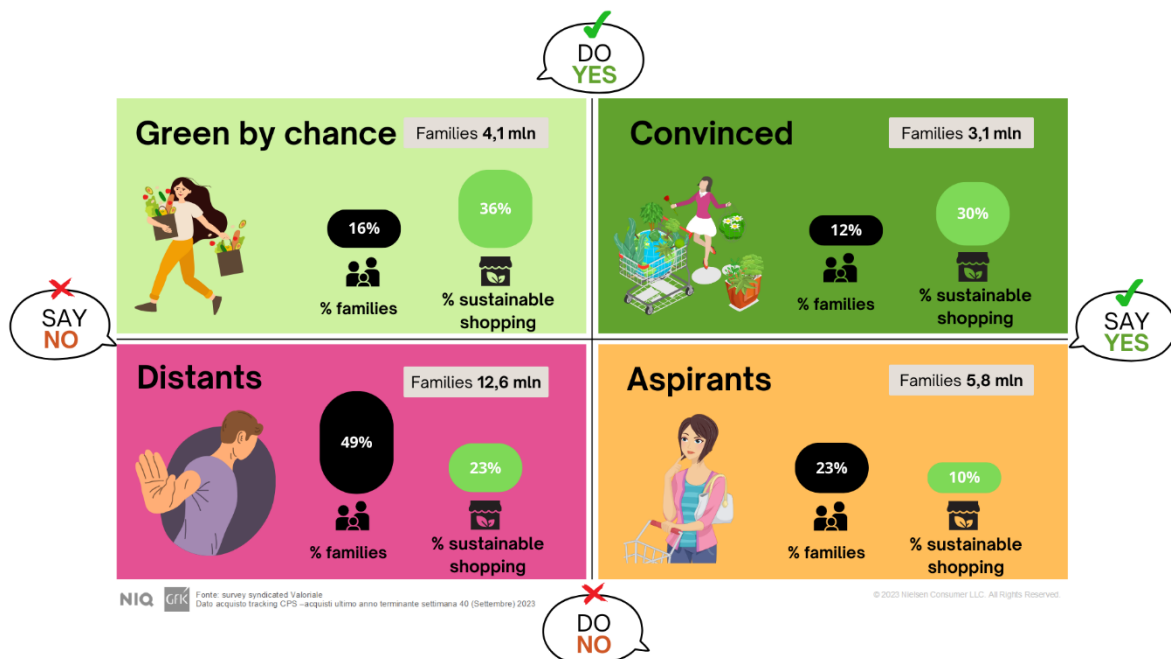

- «conscious shopper marketing» actions divided by touch point (assortment, packaging, prices and promotions, space, communication in and out of store, loyalty program), with related performances and measures.

What companies declare through the questionnaire will then be integrated and compared with the study of the performance of the distribution brands in regards of the sustainable baskets identified. Through NIQ's Retailer Measurement Service, data will be obtained on the sustainable baskets of 45 Italian brands in relation to assortment, sales, and promotional impact.

The intersection between the analysis of demand and the analysis of the supply allows us to understand if there is a correlation between the sustainable profile of consumers and the distribution performance of the brands in terms of sustainable baskets. In other words, it investigates whether the presence of clusters of virtuous consumers is also a result of retailers' commitment to making sustainable options available and accessible.

Preliminary results This work presents the results of the first phase of the research, which analyzed the demand, as data collection for the analysis of the supply is currently on-going. The NielsenIQ Consumer Panel was questioned regarding the dimension of “saying” (attitude towards sustainability and intentions to purchase sustainable products) and “doing” (actual purchase of sustainable products), resulting in the identification of four clusters of shoppers (Figure 1).

Figure 1: Four clusters of shoppers

Source: Authors' elaboration based on NIQ data

The upper part of the matrix displays two clusters, namely 'green by chance' and 'convinced', which represent families that purchase sustainable products (“they do yes”), but with a different level of awareness. While the “convinced” cluster reflects intentional purchases, the “greens by chance” cluster seems to make sustainable purchases unintentionally. It is interesting to understand what stimulates this behavior which we could define as “unconscious”. The two clusters located in the lower part of the matrix (“distant” and “aspirants”) incidentally purchase sustainable products but for different reasons. The “distant” do it by choice: they do not believe so strongly in sustainability and consequently their contribution to sustainable spending is modest. The “aspirants”, on the other hand, would like to be able to buy more sustainable products, but they don't and it's interesting to understand the reasons.

Socio-demographic and behavioral data resulting from the Consumer Panel allow us to delve deeper into the reasons underlying the sustainable profile of the clusters and to draw useful indications to guide the strategies of the companies interested in operating the levers of shopper marketing to promote conscious purchases at the point of sale. Our attention is initially directed towards the most contradictory clusters, namely the “aspirants” and the “green by chance”, where there is a discrepancy between intentions and behavior.

“Aspirants” undoubtedly represent the segment of greatest interest for companies given their unexpressed potential. We are talking about 5.8 million families, equal to 23% of the Italian population, which only account for 10% of sustainable spending, despite the declared sensitivity towards sustainability.

If we deeper analyze the behavioral profile of the “aspirants”, we find some of the reasons that explain their positioning. The cluster is composed by families who pay great attention to prices and promotions but are also attracted by the aesthetic stimuli in point of sale and by novelties, sensitive to industrial brands, preferably local ones. They inform

themselves and are attentive to what they eat, they seek simplicity and freshness through supply chain and production guarantees, their food spending tends to be basic and mainstream.

What could be the most effective shopper marketing levers to activate this cluster? Prices and promotions should certainly not be underestimated, but within the context of a rich and captivating offer and an engaging shopping experience. Investigating the barriers to purchase of "aspirants" is therefore fundamental to understand which shopper marketing levers to use to engage this target and to being able to translate "good intentions" into "good behavior".

The "**greens by chance**" represent an equally curious target to seek for the reasons behind their "unconscious" sustainable purchases. Represented by 4.1 million Italian families, equal to 16% of the population, they contribute to 36% of the overall sales volume of sustainable shopping, a percentage that exceeds that of the "convinced". The Consumer Panel frames it as a rational and dynamic target, which distances itself from "green" behaviors, attentive to the quality of the products, regardless of sustainability certifications. They purchase premium products with high added value, selecting plant-based alternatives, healthy and few indulgent products. Their "sustainable" cart therefore seems to be more justified by the search for nutritional quality, therefore, not necessarily sustainable products in terms of packaging or processes. Individual well-being prevails over environmental well-being, which is why they are weaker in terms of interests and declarations. Since this is a rational target looking for practicality, they opt for points of sale with a quality but also convenient offer and seem willing to sacrifice the sustainability of the packaging for better quality and use of the product itself. It is therefore not surprising that they are good customers of the e-commerce channel.

The "**convinced**" represent the ideal target of all companies: individuals who approach sustainability in a conscious manner and also do so in their purchasing choices. They still constitute a modest portion of the Italian population (12% of Italian families, equal to 3.1 million families) but their contribution to the total amount of sustainable spending is substantial (30%). From the analysis of the Consumer Panel data, a rational profile emerges, which addresses spending in a prudent manner but at the same time open to exploration and impulse. Oriented towards a balanced diet, they seek premium products with a high service component, in fact in their cart they have many plant-based alternatives, few indulgent products and favor products with sustainable packaging. Sensitivity towards environmental well-being is the element that distinguishes them from the previous cluster, which on the contrary is more focused on individual well-being mainly limited to the world of nutrition.

Finally, the last cluster, the "**distant**" ones, constitute the ground on which all companies should work: 12.6 million families, almost half (49%) of the Italian population, who follow a lifestyle and food style that do not prioritize individual and environmental well-being. More attentive to saving money compared to the nutritional quality of the products, they declare themselves unwilling to pay a premium price for sustainable products. Given the large number of this target and the negligible impact on sustainable spending (23%), they certainly cannot be ignored by companies who must ask themselves how to intercept them to educate them about sustainability and make them more aware of the impact of their purchasing choices on the environment and the society. It certainly won't be a quick path nor a feasible path through just the shopper marketing levers. Observing the distribution realities where this target has a smaller presence will certainly help to identify the most effective governance models and strategies to reduce the size of the cluster.

The analysis of demand reveals a reflection on the role of shopping places in this context. Specifically, we question to what extent the points of sale where consumers shop for groceries can influence the "doing" dimension, in consideration of the role that distributors assume in consumption and purchasing choices and the ability to influence shopper marketing levers (Shankar 2021, Bellini 2023).

The analysis conducted through the Consumer Panel enables us to identify the preferred purchasing channels for each target audience, as well as the stores they habitually frequent for grocery shopping. This information, when integrated with the analysis of the offer, helps us to answer the previous question and to get closer to the ultimate objective of the study: understanding the most effective strategies to promote sustainable purchases in retail stores.

Currently, while awaiting the results of ongoing research, we offer a few reflections. For instance, when considering the "green by chance" cluster, it is worth reflecting on whether sustainable purchases are encouraged by the retailer they choose. Consumers may unconsciously purchase sustainable products due to their familiarity with accessing a commercial offer that includes sustainable options, which are often promoted through shopper marketing techniques such as display space, prices, and promotions.

Equally interesting is the profile of the "aspirants", those who would like to buy sustainable but don't. The reasons could be linked to socio-cultural factors (e.g. low income, poor culture, and attention to sustainability) but also to barriers on the supply side. For example, they could frequent stores that do not have an adequate or accessible assortment of sustainable products in terms of economic convenience.

A similar argument can be made about the "distant" cluster, for whom however a cultural obstacle must first be removed which makes them not very sensitive and motivated towards the purchase of sustainable products. Certainly, on these targets the levers of price and promotions could take on a greater importance than the targets of the "convinced" and "green by chance", for whom it might instead be more appropriate to work on the attractiveness of the offer and on its in-store valorization.

In summary, examining the profiles of the four clusters enables us to identify the most effective shopper marketing levers to engage with individuals based on their attitudes ("saying") and behaviors ("doing"). This is an essential condition for companies who wish to undertake a path of "conscious shopper marketing".

Research limitations. *The present study is not limitations-free. Firstly, it is an ongoing research, so the results should be considered preliminary. Additionally, difficulties were encountered during the compilation of the self-assessment questionnaire of the retailers' sustainable profile, due to the lack of an evaluation system and a commonly recognized language shared by the participants. Finally, this study is an initial and exploratory part of a larger project. The research will be repeated annually to mitigate the current limitations and identify a language that is not only shared by project participants but also functional for drafting sustainability balance sheets according to new regulations. Finally, monitoring demand behavior over time can help to eliminate cyclical elements from the results and provide valuable insights for management.*

Managerial implications *This study presents important findings to guide companies in developing sustainable strategies and practices. It also addresses the preparation of social balance sheets, which will be mandatory from 2026 for companies with a turnover exceeding 50 million euros and will have to include a section dedicated to “consumers and end users”.*

It is only by starting from the knowledge of the demand and its consumption and purchasing behavior that it is possible to understand what the most effective actions are to engage with individuals and make them a driver of sustainability alongside businesses. The mapping of the demand presented in this study allows companies to understand the profile of their shoppers and consequently identify the marketing levers to activate based on the target segment they intend to address. Actions aimed at stimulating sustainable shopper behavior can become a field of shared action between industry and distribution, in the perspective of a pre-competitive vision of sustainability.

The study's relevance is not only strategic; numerous studies highlight a direct correlation between companies' economic performance and their commitment to sustainability. Furthermore, the ability to stimulate actions that generate a positive impact for individuals, society, and the environment is crucial in supporting the social role of the fast-moving consumer goods supply chain. Additionally, these results may be of great interest to institutions and public policies aimed at promoting societal and national well-being.

Originality of the paper. *To the best of the authors' knowledge, this research is the first attempt to segment demand in terms of sustainability based on the variables of “intention” (the dimension of “saying”) and actual behavior (the dimension of “doing”). This attempt was made possible by the use of NielsenIQ databases (Consumer Panel and RMS), which provide objective measures and allow us to overcome the accuracy limits of previous studies based on self-assessment and self-reporting systems. Additionally, this study offers a unique perspective on sustainability for two main reasons. Firstly, it examines the phenomenon from a demand perspective, which sets it apart from most studies that focus on supply and production processes. Secondly, it analyses marketing tools that are used to stimulate demand using behavioral economics frameworks. The application of nudging in shopper marketing to encourage sustainable consumption and purchasing behavior is a relatively unexplored area of research. However, the writers believe that it holds enormous potential on the managerial, social, and institutional fronts.*

The Family Caregiver Experience in Palliative Care Pathways: Development and Validation of a Multidimensional Approach

MARZIA CETTINA SEVERINO¹ COSTANZA GALLI² SABINA DE ROSIS³

Abstract

The caregiver plays an essential role in specific phases of the long-life journey of people, especially in delicate moments as the end-of-life. They serve as a central point in supporting and caring for patients in the terminal phase. Exploring the experience of family caregivers along the end-of-life pathway is crucial to ensure a respectful and high-quality experience with healthcare services, not only for terminal patients but also for their family caregivers. The aim of this study is to validate a multidimensional approach to investigate this experience through a co-design process involving professionals and caregivers.

Dimensions enabling the exploration of the caregiver's experience along the end-of-life path were identified through a literature review. The framework was shared with professionals involved in end-of-life care pathways. Through a mini-Delphi process conducted with both professionals and caregivers, the priority levels of these dimensions were assessed, and any differences and similarities in the perception of more or less prioritized dimensions were investigated across the board. The results underscore the importance of needs, psychological support, and communication in enhancing assistance to family caregivers throughout the end-of-life care path.

Key words: End-of-life, Experience, Caregiver, mini-Delphi study

Framing of the research. *In a context characterized by rapid demographic, socioeconomic, and familial evolution, alongside prevalent conditions of advanced chronic illness and an increase in individuals requiring long-term care, palliative care becomes strategic in ensuring quality and continuity in the care pathways of the sick. According to the definition provided by the International Association for Hospice & Palliative Care (IAHPC, 2017), palliative care encompasses the prevention, identification, assessment, and management of physical issues, including pain and other debilitating symptoms, psychological distress, spiritual discomfort, and social needs, providing support to family members and caregivers during various stages of the patient's illness and in the bereavement phase. Definition from The National Hospice and Palliative Care Organization defined the palliative care as “a specialized approach to the treatment of patients with a serious or life-threatening illness. The goal of palliative care is to provide relief from the symptoms, pain and stress of serious illness. It is also designed to improve the quality of life of both the patient and the patient's family. Palliative care is provided by a team of specialists who are trained in assisting patients and their families through what can be the most difficult time in their lives. Members of the team typically include physicians, nurse practitioners, social workers, and spiritual care coordinators. Some palliative care teams have physical and speech therapists, pharmacists, dieticians and trained volunteers.” As evident, palliative care is not only about healthcare services, but also social care, third sector activity and other kind of services for patients and their family.*

This multi-stakeholder and multi-disciplinary approach applies to a specific challenging period called end-of-life, which refers to the critical timeframe of an individuals' life-long journey after diagnosis of a life-limiting illness. It “preceding an individual's natural death from a process that is unlikely to be arrested by medical care” through bereavement (Hui et al., 2014).

Italy is at the forefront in Europe with Law 38/10, recognizing palliative care as a right for terminally ill patients. Recent socio-health system development programs, supported by the PNRR, emphasize the importance of such care and the need for integration among the various stakeholders to provide adequate assistance in different care and support contexts. Palliative care demands high levels of assistance and, consequently, strong involvement of informal caregivers (Kim et al., 2023). The latter represents a fundamental resource in many European countries, especially in those in the south, including Italy, characterized by a “familialist” welfare system (Esping-Andersen, 1990), commonly referred to as “countries with strong family ties” (Saraceno, 2010).

The caregiver responds to various social and health needs of the person they care for throughout the palliative care path, dealing with symptom management (Funk et al., 2015), medication administration (Wilson et al., 2018), emotional and social support for the patient, often ensuring the person's continuation in their own living environment (family and social).

Informal caregiver assistance constitutes a multidimensional caregiving work in practical/organizational, emotional, relational, and ethical terms (Brenna, Di Novi, 2015, 2016), with possible significant interferences with the performance of other professional, family, and parental roles (Fahle, McGarry, 2017). Informal caregiving activities, over time, can wear down the physical and psychological capacities of the caregiver, even leading to a crisis in the choice of home care (Vellone, 2021). The well-being of caregivers has a significant impact on patient outcomes, service functionality, and the overall sustainability of services, affecting the caregivers' productivity, their participation in service delivery, their collaboration in the value creation, and their contribution to service sustainability. Thus, it is important to recognize the person behind the definition of caregiver, and his/her needs, preferences, perception of his/her role, of the experience with services provided to them and to patients, and of the value they receive and co-produce together with patients and providers. Investigating caregivers' experience along the palliative care path is fundamental to understanding end-of-life services' functioning, better managing them and improving their quality, not only when provided to patients but also to caregivers.

In this study, we believe that the key to assessment lies in understanding the dimensions relevant to the caregiver.

Purpose of the paper. In light of these premises, our goal is to investigate the perception of the most or least prioritized dimensions by caregivers and professionals, with the ultimate aim of validating a multidimensional approach to explore the caregiver's experience along the pathway of palliative care.

Methodology. A review of the literature has been performed to identify the dimensions enabling the exploration of the caregiver's experience along the end-of-life path were identified through a literature review. First, a comprehensive list of pertinent keywords and search terms was defined by a team composed by three researchers. The keywords were related to: (i) the phase of the journey: end-of-life, (ii) the target of interest: caregivers, (iii) the object of study: the experience with services. The selected keywords and the related algorithm for the preliminary search on scientific databases was:

("end of life" OR "palliative care" OR "terminal care") AND
(("caregiv*" OR "famil*") OR support) AND
("experience" OR "satisfaction").

A few exploratory searches in Google Scholar were conducted, using the above-mentioned general terms in order to:

- Identify relevant background documents,
- Review any recent, highly-cited articles related to the topic (as available),
- Read through the top results for a couple different searches, paying particular attention to the language used to define and describe the topic,
- Take notes on relevant findings to inform the research,
- Go back and modify your research question and scope as useful.

The search was executed across the chosen databases, utilizing the identified keywords and search terms. Applying inclusion and exclusion criteria, we refined the results and focused on the most pertinent articles. The research team developed a structured data extraction form to gather relevant information from each selected study, based on an excel file. The final step was the summary and synthesis of the key findings from each study, and a workshop for discussing the results with practitioners from the Palliative Care Functional Unit of Livorno (Tuscany, Italy).

A mini-Delphi study was conducted in collaboration with a purposive sample of caregivers and professionals involved in the palliative care services in Tuscany Region. Since a minimum panel of 15–20 experts is recommended to ensure sufficient contributions in a Delphi process (Hasson et al., 2000), the research team set to 20 members the minimum number of participants. The aim was to investigate the perception of professionals and caregivers regarding the relevant dimensions of experience, emerged from the literature analysis. The data were used to understand any differences and similarities in the responses provided by the two groups of participants. The Delphi process was carried out through the distribution of an online questionnaire. The questionnaire included both open-ended and closed-ended questions. Respondents were asked to rate each dimension and sub-dimension on a scale from 1 (not important) to 10 (very important). Additionally, they were asked to prioritize the dimensions from most to least important. The open-ended questions, which were optional, allowed participants to provide suggestions regarding each dimension or sub-dimension.

The panel members received via e-mail the invitation to participate in each round of the Delphi study. Participants received one or more subsequent follow-up e-mails, as reminders, when necessary. Two Delphi rounds were expected. However, the Delphi process did not require further rounds to reach a common final decision as the results showed consistency among the two groups of participants at the first round. Consequently, the results were validated with the professionals.

Quantitative data from the closed-ended questions of the Delphi study were analysed performing descriptive statistical analyses and t-tests with the use of SAS software. The qualitative comments left in the open-ended questions were analyzed using two flexible and open qualitative methods (Silverman, Gobo, 2002): bottom-up content analysis (Krippendorff, 2018) and polarity analysis of comments in positive, negative, neutral, and mixed categories. The first method allows for

the discovery of new categories and exploration of the data in detail, identifying themes and categories during the analysis phase, without any preconceptions. Therefore, content analysis enables the identification of categories to deepen the data analysis and report the results. The other method, on the other hand, allows for the identification of comment polarization based on the words and expressions used in the text.

Preliminary Results.

Review of the literature

Currently, despite little consensus on what are the dimensions of caregivers' experience with end-of-life (Ringdal et al., 2002), some scholars have identified several of them. In general, these include the provision of information, communication, practical and emotional support (Dy et al., 2008; Grunfeld et al., 2008). Several data collection tools have also been developed to measure patient and/or caregiver satisfaction and experience in the context of palliative care, delivered both in hospice and at home (Grunfeld et al., 2008; Kristjanson, 1993), but none of them assesses all domains. Additionally, there are few validated survey instruments for the wide range of palliative care contexts or for different geographic regions (Abernethy et al., 2008; Dy et al., 2008).

To evaluate the quality of "overall" care (Tang et al., 2014) and wellbeing of caregivers in this last phase of life of their loved ones, dimensions such as the following ones have been used: Psycho-physical (e.g., pain management); Social and relational (e.g., respect and dignity, relationship with doctors); Environmental (e.g., home, hospice room, hospital) (Daly et al., 2013; Breibart et al., 2015; Zimmerman et al., 2014; Zhang et al., 2012).

We found four questionnaires mostly used in the research on the topic, namely:

- CAHPS, provided and used by The Centers for Medicare & Medicaid Services (CMS); Agency for Healthcare Research and Quality (AHRQ); United States Department of Health and Human Services,
- CANHELP, provided and used by CARENET Canadian Researchers at the End-of-Life Network. (n.d.). CANHELP Tool.
- CBI: Caregiving Burden Inventory, provided and used by Novak, M., & Guest, C. (1989)
- ZBI: Zarit Burden Inventory, provided and used for interviews by Chattat et al.; (2011)

Below there is a detailed summary of the dimensions identified from the literature to explore the experience of caregivers of patients in palliative care, presented to professionals and on which the participants expressed their views in the participatory subsequent process:

- Needs
 - o Physical, emotional, social, and spiritual
- Responses
 - o Physical, psychological, and social support and assistance
 - Specific instructions for addressing the patient's physical symptoms and how they have adapted to the patient's physical needs
 - Presence of a social support network for caregivers (including family members, friends, or specific support groups for palliative care). Access to the support network and how it has influenced their emotional well-being during the palliative care journey
 - How they have coped with and managed their emotions (anxiety, stress, etc.), whether they have received psychological support to address them
 - o Promptness in providing appropriate responses (to social, psychological, and physical needs)
 - o Continuity of responses to pain, symptoms, social, and psychological aspects
- Responses in the Home Context
 - o Perception of home visits in terms of the quality of care received
 - o Perception of the frequency and timing of each visit
- Availability in case of need
 - o 24/7 telephone availability (*this service is only available in Livorno)
 - o Listening to the needs of caregivers by all professionals and the ability to coordinate and mobilize services to ensure appropriate responses to needs - ability to direct to competent professionals or services.
- Clarity and adequacy of information
 - o Clarity of diagnosis (regarding the consequences of the disease from a physical, emotional, and psychological point of view)
 - o Clarity of program and actions
 - o Clarity of prognosis (knowledge regarding the proximity of death)
 - o Investigating the emotions experienced when receiving this information and their perception regarding how it was communicated
- Communication and involvement
 - o Adequacy and consistency of communication among the various professionals involved in the process (convergent or divergent information)

- Involvement of the family in decisions (definition of the PAI)
- Barriers to communication in receiving information or communicating with medical, nursing, etc., staff (complex medical terminology or lack of dedicated communication time)

Mini Delphi.

47 participants were involved in the Delphi study, with an overall response rate of 75%. There were 28 open comments left by respondents within the questionnaire. Table 1 shows the number of respondents.

	Invited people	Respondent people	Response rate
Caregiver (CG)	27	18	83.36
Provider (PR)	22	19	66.66
Tot	47	37	78%

The number of participants is sufficient for the data analysis, both considering all the respondents together and the two sub-groups of participants.

Respondents have an average age of 55 years and are predominantly female in both the groups (83%). Educational attainment was only queried from participants who declared themselves as caregivers. In total, 13 caregivers responded to this question, with a medium-low level of education (76%).

The results of the Delphi study show an overall high rating across all dimensions considered. In particular, dimensions related to needs, responses, clarity of information, and availability in case of need received very high scores, with averages exceeding 9 on a scale from 1 to 10. The results do not present statistically significant differences between the responses of caregivers (CG) and professionals (PR). Below is the summary table of the question "How important do you consider it in evaluating the end-of-life path to explore the following dimensions of the caregiver's experience?" with details for respondent groups.

Perceived importance of the dimension...		N.	Mean	SD	Min	Max	T-test
Needs	CG	18	9,33	1,03	7	10	0.7058
	PR	19	9,05	1,13	7	10	
	Tot	37	9,19	1,08	7	10	
Responses	CG	18	9,39	1,09	6	10	0.3757
	PR	19	8,79	1,36	6	10	
	Tot	37	9,08	1,26	6	10	
Clarity and adequacy of information	CG	18	9,44	1,34	5	10	0.0519
	PR	19	9,37	0,83	8	10	
	Tot	37	9,41	1,09	5	10	
Availability in case of need	CG	18	9,56	0,78	8	10	0.0636
	PR	19	9,11	1,24	6	10	
	Tot	37	9,32	1,06	6	10	
Responses in the Home Context	CG	18	9,17	0,78	8	10	0.3572
	PR	19	8,53	1,24	6	10	
	Tot	37	8,84	1,54	5	10	
Communication and involvement	CG	18	9,67	0,69	8	10	0.6107
	PR	19	9,58	0,61	8	10	
	Tot	37	9,62	0,64	8	10	

Regarding the analysis of the sub-dimensions of needs, it emerges that emotional needs were rated as particularly important by caregivers, with an overall average exceeding 9. Only the sub-dimension "information/training" received a statistically significant higher average score from the caregiver group compared to professionals (CG: mean 9.67, SD 0,69; PR: mean 9.11, SD 1,2; $p=0.0261$). Regarding the sub-dimensions of responses, an overall high rating is observed for all the dimensions considered, for both groups, with an average exceeding 9 out of 10. The analysis of sub-dimensions related to the home setting shows that the quality of care received at home was rated as particularly important, with an average score exceeding 9.5. However, evaluations concerning the frequency and timing of visits received slightly lower scores, although still high. No statistically significant differences were observed between the responses of caregivers and professionals regarding these sub-dimensions.

The sub-dimensions related to responsiveness in times of need received high ratings from both groups, with an overall average exceeding 9. In particular, 24-hour availability was rated as more important by providers than caregivers, with statistical significance (CG: mean 9.22, SD 2.13; PR: mean 9.26, SD 0.99; $p=0.0023$).

The sub-dimensions related to clarity and adequacy of information received high ratings from both groups. In particular, clarity of the program and actions was rated as particularly important. However, no statistically significant differences were observed between the responses of caregivers and professionals on these sub-dimensions.

The sub-dimensions of communication and involvement also received high ratings from both groups. In particular, the adequacy and congruence of communication were rated as particularly important. However, statistically significant

differences emerged between the responses of caregivers and professionals on this sub-dimension, with professionals attributing greater importance to the adequacy and congruence of communication (CG: mean 8.67, SD 1.75; PR: mean 9.63, SD 0.96; $p=0.0146$) and the caregivers' involvement (CG: mean 8.44, SD 1.92; PR: mean 9.26, SD 0.81; $p=0.0006$), compared to caregivers

The results of the ranking (1st place) of dimensions according to the order of priority indicate the preferences expressed by participants regarding the importance attributed to each dimension in the context of palliative care. Regarding the dimension of needs, both caregivers (CG) and professionals (PR) positioned this dimension as one of the main priorities, with a total of 24.32% of responses. The dimension of responses, on the other hand, was rated as less prioritized compared to all others, by both groups. However, the relatively low number of responses may indicate that it may not be considered one of the main areas for intervention.

For the dimension of Clarity and Adequacy of information, although caregivers positioned this dimension lower compared to professionals, it still remains a significant priority with 18.92% of the total responses.

The dimension of Communication and Engagement received the second highest number of overall votes, with 21.62% of the total responses. However, it is important to note that caregivers assigned a higher score than professionals on this dimension.

All comments left in the open-ended questions were read in detail, aiming to capture their meaning and lived experience, associating significant aspects that influence them. There were 28 comments left by respondents, 17 from caregivers and 11 from professionals. From an initial reading of the comments, three broad categories were identified to classify both professionals' and caregivers' comments. These categories relate to personal, professional, and organizational aspects.

About the personal aspects, caregivers highlighted the emotional and social impact of their role, emphasizing the complexity of managing the emotional and physical aspects associated with their loved ones' illness. The importance of psychological support in addressing these difficulties emerged.

With regard to the professional aspects, the main criticisms concern communication, with language barriers and inadequate information about the state of the illness. There was highlighted a contrast of information between palliative care specialists and other professionals, along with a lack of coordination among them.

Regarding the organizational aspects, professionals emphasized the need to increase the services offered, particularly the presence of professionals such as psychologists in palliative care. There was also a need highlighted to enhance support for caregivers and improve teamwork among the various professionals involved.

The results of the Delphi study were presented and discussed with professionals, who expressed their interest in the results with some aspects of novelty with respect to their daily-life experience on the field.

Discussion. The caregiver plays an essential role in palliative care pathways, representing a central point in providing support and assistance to patients in the terminal phase of their life. Behind the role of caregiver, there is a person whose wellbeing affects the outcomes for patients, the function of the services themselves, and the life of the same caregivers also in terms of productivity, ability to participate in the service delivery, co-produce value and contribute to the sustainability of the services. The preliminary results of this study clearly indicate that evaluating end-of-life journeys through the caregiver's experience requires a multidimensional approach that considers various aspects at different stages of the journey. The importance of addressing needs and the necessity of psychological support have emerged as fundamental in dealing with caregiving-related challenges. Additionally, the quality of care received at home has been assessed as particularly important, highlighting caregivers' desire to keep the patient in their familiar environment for as long as possible. Caregivers have highlighted the lack of clarity and consistency in the information received, as well as the lack of coordination among the various professionals involved in palliative care, emphasizing the need for improvement in communication among all stakeholders. Interestingly, the results have shown discrepancies between the evaluations of caregivers and professionals, especially regarding the importance attributed to communication and engagement. While professionals prioritize communication as a key dimension based on questionnaire responses, caregivers express concerns about the lack of communication or coordination among professionals, as highlighted in the analysis of open-ended responses.

Research limitations. The data presented in this article are from a small group of purposively enrolled professionals and caregivers. The results may not be generalizable. Therefore, they should be considered as a stimulus to further research and expand the available evidence, particularly regarding the role that palliative care services could play in promoting evidence-based support policies for caregivers.

In future research steps, it will be crucial to directly involve family caregivers in a final workshop and discuss the evidence that has emerged with them.

Managerial implications. In this study, we believe that the key to evaluation lies in understanding the dimensions relevant to the caregiver to develop tools capable of assessing the overall quality of services in their perspective. Given the crucial role of caregivers in palliative care pathways, it is necessary to understand their experience in order to improve the quality of care and responses provided not only for the patient but also for family caregivers. This is even more necessary in light of the transformative pressures stemming from the National Recovery and Resilience Plan (PNRR) and DM77. One useful tool for defining, measuring, and evaluating interventions could be a caregiver voice detection

system. There are some specific and non-continuous experiences of collecting Caregiver-Reported Measures (Desai et al., 2018), tools capable of monitoring and detecting further evidence for the improvement of care and support initiatives for caregivers. Such surveys could also be useful for reconstructing the actual healthcare and social network that supports both the patient and the caregiver, in order to identify best practices for integration.

In addition, the preliminary results of this study have clear managerial implications since they highlight important differences in the perception of providers and caregivers, which related also to the organization of end-of-life services: they regard the caregivers' preferences for domiciliary services and the less importance attributed to the 24 hours services with respect to coordinated and high-quality services in structured moments.

Originality of the paper. This is one of the first studies exploring the caregivers' experience with end-of-life services, by directly involving both caregivers themselves and professionals in a collaborative process of research. It provides insights for future study on the topic and initial suggestions on potential changes in the organizational models for addressing the caregivers' preferences and needs, and to increase their wellbeing in this critical phase of life.

Balancing Act: The Impact of Product-Oriented Sustainability Information on Consumer Responses

VALENTINA MAZZOLI¹ LAURA GRAZZINI² AULONA ULQINAKU³

Abstract

Despite the emphasis on sustainability in corporate communications, fashion brands often fall short in integrating it into product-oriented messaging, especially in e-commerce platforms. This study draws upon signaling theory and information processing theory to investigate the impact of product-oriented sustainability information on consumer responses when purchasing online. We hypothesize that the presence of product-oriented sustainability information produces positive effects on consumer response. However, an increase in the amount of sustainability information may elicit negative consumer responses, thereby challenging the efficacy of sustainability signals. This phenomenon is attributed to information overload, wherein excessive information surpasses individuals' cognitive processing capacity, resulting in diminished information processing and potentially adverse outcomes. The study is based on a mixed method design. Through an exploratory content analysis, we examine actual product-oriented sustainability information across luxury and fast fashion brands' e-commerce platforms. Preliminary findings reveal variations in the presentation of sustainable product attributes, with certain brands allocating a substantial portion of product information to sustainability. Building upon content analysis' findings, ongoing research plans to conduct experiments to evaluate the effect of product-oriented sustainability information on consumer responses assessing also the mediating role of information overload. We anticipate that an excessive amount of sustainability information provided by fashion brands may lead to unfavorable consumer reactions due to higher information overload. Consequently, our study emphasizes the importance of carefully balancing sustainability information to prevent information overload and foster positive consumer responses. This research contributes to the understanding of sustainability communications in the fashion industry and consumer behavior research. Furthermore, it highlights the evolving landscape of sustainable fashion communications and its implications for industry stakeholders.

Key words: Product-oriented sustainability information; information overload; signaling theory; e-commerce; sustainable fashion communication.

Framing of the research. The fashion industry has faced scrutiny for its employment practices and labor standards across its extensive supply chains, along with the detrimental environmental effects stemming from the production, usage, and disposal of raw materials and finished goods (Crane and Glozer, 2016; Moretto et al., 2018). For instance, fashion manufacturing contributes to 10% of global carbon emissions, equivalent to the European Union's output, depletes water sources, contaminates rivers and streams, and results in 85% of textiles ending up in landfills annually. Even the act of laundering clothes releases 500,000 tons of microfibers into the ocean yearly, akin to 50 billion plastic bottles (Business Insider, 2019).

In response to these criticisms, the fashion industry is increasingly embracing eco-friendly practices, with companies continuously enhancing their sustainability approaches (Wang et al., 2019) and emphasizing their environmental or social credentials. The realm of sustainable fashion encompasses diverse practices, including environmental and social considerations, slow fashion, reuse, recycling, cruelty-free, and anti-consumption measures.

Luxury and fast fashion brands alike have been integrating sustainable measures into their operations. For instance, Stella McCartney, a leading sustainable luxury fashion brand, utilizes eco-friendly materials such as vegan leather, recycled synthetics, organic cotton, and faux fur (Vogue, 2021). Gucci has instituted the Gucci Equilibrium program, focusing on reporting corporate social responsibility (CSR) policies, environmental impacts, employee satisfaction, and structural innovations. Similarly, Primark recently launched Primark Cares, aimed at reshaping clothing production and sourcing practices to minimize fashion waste and enhance the well-being of those involved in Primark's product supply chain. Furthermore, consumers are increasingly mindful of the ethical implications of their purchases, adapting their buying behaviors to favor environmentally and socially responsible brands (Amatulli et al., 2021; Grazzini et al., 2021).

Sustainability initiatives are frequently well-described in specific sections of corporate websites or in sustainability and CSR reports. However, when it comes to the point of purchase, products often fail to provide sustainability information and details about the production process. Some brands limit themselves to displaying only the material composition of items, while others devote ample space to describing the production process and the product's impact on the environment or society. Due to these differences in product-oriented sustainability information practices among brands, we aim to investigate the impact of this information on consumer responses.

Purpose of the paper. Previous studies have extensively explored the engagement of fashion companies in corporate social responsibility (CSR) activities (e.g., Acuti et al., 2022), examining the primary communication channels they utilize to disseminate information about environmental and social initiatives (e.g., CSR reports, corporate websites). Many prominent global fashion brands have emphasized sustainability as a fundamental aspect of their mission through official communication channels. However, there appears to be a reluctance to integrate sustainability themes into product-oriented communication. For instance, while Gucci promotes a comprehensive, eco-friendly program aimed at reducing its environmental footprint, sustainability features are only highlighted in a limited number of product categories on the company's website.

This study explores the mechanisms and reasons behind the potential negative impact of the quantity of sustainable product information on consumer responses. Drawing upon signaling theory (Connelly et al., 2011; Spence, 1978), we aim to elucidate a possible pathway for understanding the relationship between the amount of sustainable product information and consumer perceptions.

Signaling theory. Signaling theory is a concept often used in economics and communication studies to explain how individuals or entities convey information to others (Spence, 1973). It suggests that in situations where one party possesses more information than the other, signaling becomes crucial for effective communication and decision-making. Two key parties are involved in the signaling process: the sender (e.g., the company) and the receiver (e.g., the consumer). The sender is the party with information to convey, and he must make decisions regarding whether and how to communicate the information they possess. This decision involves considerations such as what information to convey, how to convey it, and the potential consequences of signaling. On the other hand, the receiver is the party that receives the signal and he must interpret the signal provided by the sender. This involves assessing the credibility, reliability, and relevance of the signal to make informed decisions. Thus, signaling theory is concerned not only with the transmission of information but also with how that information is interpreted by the receiver (Connelly et al., 2011). In this study, signaling theory is employed to elucidate the relationship between the quantity of product-oriented sustainability information and consumer perceptions. In an online environment characterized by high information asymmetry, brands play a pivotal role in shaping consumer opinions and decisions through the signals they convey (Javornik et al., 2020). Signaling theory posits that brands utilize signals to convey latent quality attributes to consumers, thereby reducing information asymmetry (Connelly et al., 2011).

The presence of product-oriented sustainability information. Product oriented sustainability information refers to the communication of product attributes, such as the use of recycled materials (Grazzini et al., 2021). Communication of sustainable product attributes has been shown to enhance consumer satisfaction and purchase behaviors (e.g., Hernandez et al., 2015). Prior research across various industries, including fashion, has demonstrated the positive influence of sustainable product attributes on consumer behaviors (Joshi & Rahman, 2015; Kumar et al., 2017; Cervellon & Wernerfelt, 2012; Steinhart et al., 2013; Niinimäki, 2010). Moreover, signaling theory supports that the presence of product attributes reduces the information asymmetry between the consumer and the company leading to positive consumers' outcomes.

Thus, based on previous results and according to signaling theory, we expect that conveying product-oriented sustainability information leads to positive consumer responses.

The amount of product-oriented sustainability information. Literature presents conflicting findings regarding the impact of sustainability on luxury and fast fashion products, suggesting that sustainable product attributes alone may not ensure the success of fashion items (Bly et al., 2015; De Angelis et al., 2017; Fani et al., 2022; Janssen et al., 2017).

While existing research provides valuable insights into the communication of sustainable product attributes, there remains a gap in empirical research concerning the effect of the quantity of sustainable product information on consumer responses in the fashion industry (Amatulli et al., 2021). Information processing theory (Tybout et al., 1981) may help in the understanding of the effect of the quantity of information conveyed on consumer responses. The information processing theory explains consumer behavior by focusing on individual's cognitive processes. It suggests that behavior is influenced not only by what individuals think, but also by how they process information. Incoming information is usually stored in active memory and can trigger the retrieval of relevant thoughts associated with previously processed objects. However, since active memory has limited capacity, information needs to be transferred to long-term storage for future use. This consolidation process, known as rehearsal, involves actively linking attributes with objects. In this context, we assume that if the quantity of product-oriented sustainability information is too high, the active memory is not able to transfer the information to the long-term memory. The failure of this systematic pattern limits the benefits highlighted by previous literature coming from the association of sustainability attributes with products (e.g., Grazzini et al., 2021).

For these reasons, we expect a negative relationship between the amount of product-oriented sustainability information (high vs low) and consumer responses.

Information overload. The information processing model predicts that as information load increases, individuals may initially allocate more cognitive resources to process information, but eventually, their processing capacity may become overwhelmed, leading to decreased information processing and decision-making efficiency (Schroder, Driver, &

Streufert, 1967). In line with this, past research suggests that individuals have limited cognitive capacity and may experience cognitive overload when exposed to excessive information (Baddeley, 2000; Miller, 1956; Fox et al., 2007). This phenomenon of information overload can result in consumers becoming frustrated, confused, and less able to assimilate and elaborate on the information provided (Mitchell & Papavassiliou, 1999; Jacoby et al., 1984; Wilson, 1996; Turetken & Sharda, 2004; Maity et al., 2002).

In our context, we assume that information overload can further elucidate the negative relationship between the amount of product-oriented sustainability information and consumer responses, working as a mediator of this relationship.

Methodology. This study adopts a mixed-method design (Davis et al., 2011) to uncover the effect of the amount of product-oriented sustainability information on consumer responses. It considers two main phases: the exploratory phase and the Experimental phase.

Exploratory Phase: The initial phase of this research project involves conducting an exploratory content analysis of product-oriented sustainability information accessible on various brands' e-commerce platforms. This phase aims to gain a comprehensive understanding of the research subject/context (Bellucci et al., 2019) and to gather valuable insights for subsequent experiments. For this phase we consider all 250 brands included in the Fashion Transparency Index (FTI; Fashion Revolution, 2023). To ensure comparability of information obtained from brands' e-commerce platforms, we selected a prototype product (i.e., a white t-shirt). Data collection was conducted on the English version of the websites, and product information for the selected item from each brand was collected and stored in an Excel spreadsheet. The pdf of the website was downloaded and stored in Nvivo.

Content analysis involves systematically condensing extensive text into fewer content categories using explicit coding rules (Stemler, 2001). In accordance with Bell et al. (2018), the research team discussed and approved a coding schedule, which serves as a framework for coding all data related to an item. Additionally, the coding manual, a set of instructions for coders outlining categories and rules for text classification, was developed, discussed, and approved. To ensure consistent coding of the content, the coding manual includes a comprehensive list of dimensions, various categories under each dimension, corresponding codes for each category, and guidance on factors to consider when allocating a code to a specific dimension. The coding schedule embeds: i) the brand; ii) the industry (fast fashion vs Luxury); iii) the position of the brand in the FTI (low-medium vs medium-high); iv) the link to the webpage analysed; v) the product information available on the website; vi) the presence of sustainability signals (yes vs no) vii) the number of words embeds in the product information available on the website viii) the number of words related to sustainability ix) the dimension of sustainability (environmental vs social sustainability); x) the type of sustainability content.

Two researchers independently conducted the coding process to safeguard its internal validity, as suggested by Weber (1990). Subsequently, the results were compared to assess inter-rater reliability, following Cohen's approach (1960), and measured using Cohen's kappa coefficient, yielding a value of 0.80. To resolve any discrepancies, the researchers collaboratively discussed specific cases. In instances of persistent disagreement, a third researcher was consulted. After completing the coding process, comments were descriptively analysed, tallying categories derived from the coding process.

Experimental Phase (Ongoing): Building upon the insights gained from the exploratory study, a series of scenario-based experiments will be developed to test our assumptions.

In the first experiment, we will examine the direct effect of product-oriented sustainability information on consumer responses. A scenario-based experiment will manipulate the presence (versus absence) of sustainability attributes in the product description. Consumer responses will include attitude towards the product (Chae and Hoegg, 2013) and willingness to purchase the product (Dodds et al., 1991). These variables will be measured using previously validated scales, which respondents will rate on a scale from 1 to 7. A minimum of 100 participants will be recruited from the UK panel of Prolific Academic (Peer et al., 2017).

In the second experiment, we will investigate the effect of varying amounts of product-oriented sustainability information (high versus medium versus low) on consumer responses. The amount of information presented in this experiment will be determined through a pilot test to ensure that manipulations are perceived as intended. Consumer responses will be measured as in the first experiment. Similarly, participants will be recruited from the English panel of Prolific Academic, with a minimum sample size of 150 individuals.

In the third experiment, we will explore the mediating effect of information overload. An online experiment, based on the same manipulations as the second experiment, will be conducted. A minimum of 250 individuals will be recruited from the UK panel of Prolific Academic. The same measures as in the first two experiments will be used, with information overload being assessed using a seven-point Likert scale based on Hunter et al. (2022).

Results. *Exploratory phase.* The purpose of this exploratory analysis was to examine how different typologies of brands communicate sustainability related to the product. As the content analysis is still in progress, preliminary results refer to a sample of selected sixteen brands positioned across different tiers of the FTI. Specifically, we chose four luxury brands positioned in the low-medium segment of the index (Max Mara, Brunello Cucinelli, Hermès, and Chloé), and four luxury brands positioned in the medium-high segment (Gucci, Fendi, Balenciaga, and Saint Laurent). Similarly, we selected eight fast fashion brands from the low-medium segment (Primark, Zara, Shein, Abercrombie & Fitch) and the medium-high segment (OVS, H&M, Tezenis, Uniqlo).

The average number of words used to present and sell a product on its own e-commerce is 131 ($Min_{words}=39$, $Max_{words}=327$). Luxury brands usually use an average of 119 words ($Min_{words}=39$, $Max_{words}=188$), while fast fashion brands show an average of 143 words ($Min_{words}=48$, $Max_{words}=327$). The number of words referring to sustainability ranges from 3 to 162 words ($M_{s_words} = 55$). In terms of words related to sustainability the difference between fast fashion and luxury brands is not significant ($M_{s_words_fastfashion} = 56$; $M_{s_words_luxury} = 53$). The highest rate of the words related to sustainability over the total number of words refer to Balenciaga (88%), who describes in depth the impact of the product on the environment and Balenciaga's sustainability projects. OVS and H&M, both positioned at the medium-high level of the sustainability index spend around 70% of the product information on sustainability issues. When talking about sustainability related to the product, brands usually refer to environmental sustainability. Some brands (five out sixteen brands) refer also to social sustainability mentioning work conditions, and product and suppliers' place of origin. In terms of type of content related to sustainability brands mention not only the impact of the product on the environment (i.e., product sustainability), but also general sustainability initiatives (i.e., general sustainability), sustainability throughout the supply chain in terms of place of origin and suppliers' localization and standards (i.e., transparency), and information regarding how consumers can take care of the environment by taking care of the product (consumer sustainability). Luxury brands mainly focus on transparency, while fast fashion brands focus on product sustainability and general sustainability initiatives.

Experimental designs (expected). From our experiments, we expect that the presence (vs. absence) of sustainable product-oriented information positively affects consumers' reactions. This result will be in line with previous studies that assume that the presence of sustainability information plays critical roles in shaping consumer decisions toward sustainable practices (De Pelsmacker & Janssens, 2007).

However, excessive information availability can lead to information overload, where consumers struggle to process the vast amount of information and may become overwhelmed (Bartiaux, 2008; Connolly & Prothero, 2008; Carrigan & Attalla, 2001; Longo et al., 2019). Thus, we expect that a high amount of product-oriented sustainability information negatively affects consumers' perceptions and behaviors towards fashion products, due to information overload.

Research limitations. The current ongoing study is not free from limitations. The first limitation refers to the use of scenario-based experiments. Further study should increase the external validity of these results with a field study. Moreover, other variables (e.g., consumer green identity) should be included in the model with the aim to ensure the robustness of the model.

Managerial implications. Managerially, the study helps fashion brands understand how they should communicate sustainability in the context of product information, by showing the potential impact on consumers' perceptions. This study also suggests the need for fashion brands to carefully balance the amount of sustainability information to avoid information overload to ensure positive consumer responses.

Originality of the paper. This study advances past research on sustainable communication in the fashion context, by investigating the role of the amount of product information on consumer responses, which remains overlooked in the literature (e.g., Amatulli et al., 2021). Moreover, the study suggests information overload as a potential underlying mechanism that explains the relationship between the amount of product-oriented sustainability information and potentially negative consumers' responses. This study thus aims to explore whether, how, and why the amount of product-oriented sustainability information might negatively influence consumer perceptions and behaviors.

Catalysing Sustainability: Retailers as Driving Platforms in the Food Industry's Transition¹

ALBERTO MASSACCI * ELENA CASPRINI ♦ LORENZO ZANNI **

Abstract

As societal and environmental challenges persist, industries face increasing pressure to transition towards more sustainable practices. In this context, the food industry is under scrutiny due to its pivotal role in addressing issues such as nutrition, food security, and the environmental, social, and economic impact of its productions. While technological advancements have shown promise in improving sustainability within agricultural production, economic viability remains a critical concern. The paper starts from conceptualizing the retailer as a mediating platform, physical or digital, of communication between supply and demand. By reviewing existing literature on the role of platforms in fostering sustainability, this work explores the potential of the retail industry in driving sustainability within the agri-food sector. Through a two-stage review process, we first examine the evolving landscape of platform literature as a driver for sustainability. Then, focusing on the agri-food retail industry, we attempt to identify potential gaps and opportunities. Our findings highlight opportunities for future research and underscore the importance of innovation and value generation in driving sustainable change. The paper offers valuable insights for academics and practitioners seeking to navigate the intersection of sustainability, platforms, and retail in the agri-food industry.

Key words: Food retail; Sustainability transition; platforms; business model

Framing of the research. *While social and environmental issues related to production continue to damage our society, public attention and political commitment are leading all industrial sectors to initiate, or accelerate, the transition process towards more sustainable productions. The food industry is one of the most scrutinized sectors for several factors. On one hand, nutrition and food security continues to represent a worldwide plague, highlighting critical issues in today's production models. On the other hand, scholars point out how quest for food security (especially through intensification) may undermine transition towards sustainable agriculture and food production systems (El Bilali, 2019). The digital revolution and information technology systems have been shown to provide a great impact on agricultural production processes by improving their efficiency and the green growth in the sector (Shen et al., 2022). However, although technologies are significantly improving the environmental impact within production, it remains crucial to ensure the economic sustainability of the industry. In order to ensure a full commitment, on the production side, to the transition towards sustainable development, sustainability principles need to be integrated into the core of business design, operation, and strategy (Stubbs et al. 2008). Indeed, a business model for sustainability aims to generate social and environmental value, while preserving or improving the more traditional economic goal (Bohnsack et al., 2014). However, a wide stream of literature has emphasized how the evolution of a business model towards sustainable goals could be affected by several types of barriers, such as few financial incentives, low market acceptance or scarce legislative and political pressure (Laukkanen et al., 2014; Asswad et al., 2016).*

Hence, firms must be able to transfer the value generated by their business model for sustainability to an audience that can value and appreciate it. The growing demand for socially and environmentally responsible behavior has heightened consumers' willingness to align with social norms. Yet, over the past two decades, a market-oriented literature on consumer behaviour has underscored the disparity between what individuals express and their real actions, leading to the conceptualization of the attitude-behavior gap (Boulstridge et al., 2000). Several studies have attempted to explain such phenomena and provide valuable justification or evidence within different context (Wiederhold et al., 2018; Juvan

¹ *This study was carried out within the Agritech National Research Center and received funding from the European Union Next-Generation EU (PIANO NAZIONALE DI RIPRESA E RESILIENZA (PNRR) – MISSIONE 4 COMPONENTE 2, INVESTIMENTO 1.4 – D.D. 1032 17/06/2022, CN00000022). et al., 2014). Sultan et al. (2020) emphasize that communication, satisfaction, and trust exert a positive and significant influence on purchase behavior while simultaneously reducing the attitude-behavioral gap. Despite technology shrinking the concept of space in the market by facilitating global market interaction, it has concurrently bolstered the role of platforms in facilitating market mediation. Consequently, factors like communication, satisfaction, and trust are frequently intermediated by third parties, potentially impacting the interaction between businesses and end consumers. The concept of platform has gained prominence with the advent of Internet and globally recognized companies such as Airbnb, Amazon, and Alibaba to the point where the current economic landscape has been described as a “platform economy” by the popular business press (Rietveld et al., 2021). While in many sectors digital platforms are, nowadays, the major business model, other industries have remained tied to a less digitalized concept of platform. Indeed, its entrepreneurial meaning has been present for centuries and involves the active role in meeting and mediating supply and demand. Although the food industry has still been influenced by the arrival of new technologies, and the emergence of new entrepreneurship in this regard, it has maintained the traditional physical store as the main space for the meeting between supply and final demand.

Purpose of the paper. In such a framework, starting from the conceptualization of the retailer as a platform for exchange and interaction between demand and supply, this paper attempts to study the strategies that this organizational structure can exploit to push sustainability in the agri-food sector.

The paper will first review the main literature on the role of platform in driving the transition towards a more sustainable system (in its triple essence: environmental, social and economic). After providing a broad overview of the topic that allows us to get the overall picture about the state of the art of the literature about the main conceptual frameworks, special attention will be given to the applications in the retail food sector, aiming to comprehend its potential impact as an intermediary, particularly concerning cross-side network effects and the influence that the role of the retailer can have both on the consumer side and towards the entire supply chain. This will allow to identify specific industry characteristics and potential business opportunities for a sector that needs to converge the three dimensions of sustainability at an ever-increasing pace.

Methodology. In order to satisfy our research needs, we have used a two-stages literature review. The first stage involves the identification of the relevant literature aimed at identifying the contribution that platforms can provide to the sustainability transition. In the second phase, we will dig-in into the same literature to understand whether the food industry is proceeding in the same direction or if there are peculiarities compared to other sectors and potential opportunities that still have to be exploited.

The analysis will involve the study of academic communities through the identification of the common literature on which each article is founded [i.e. The higher the reference overlap between the two papers, the more these two papers were deemed to belong to the same community” (Casprini et al., 2020, p. 4)]. Further, the analysis will involve the identification of the main thematic clusters that emerge in this literature through the analysis of the keywords of each contribution; hence, the linkages is constructed based on the co-occurrence of the author’s keywords in the same paper. The higher the number of times in which the linkage occurs, the higher is the connection between the two themes. The research query keywords were excluded from the keywords analysis.

The analysis was conducted using VOSviewer 1.6.8 software (Van Eck e Waltman, 2010) as it allows to easily summarize and visualize our research needs and results.

We conducted the literature search on the SCOPUS database that allows to identify the relevant material based on the presence of keywords in the title, abstract or authors’ keywords.

The string implemented to satisfy our research needs is: “TITLE-ABS-KEY (sustainab* AND (platform* OR "two-sided market*" OR "multi-sided market")) AND PUBYEAR > 2003 AND PUBYEAR < 2025 AND (LIMIT-TO (SUBJAREA, "BUSI")) AND (LIMIT-TO (DOCTYPE, "ar")) AND (LIMIT-TO (LANGUAGE, "English"))”. This should allow us to obtain all the main literature that has been written in the field of Management about concepts related to sustainability and platforms. In the second phase, we repeated the search by introducing an additional filter to narrow down the scope of analysis to the agri-food sector (The filter added to the main string is: “AND (agri* OR *food*)”).

The analysis was limited to the literature of the last 20 years, written in English in the form of journal’s article². The need to provide the most up-to-date view (including articles published in 2024) is due to the need to offer adequate support to the objectives of the agritech project within the National Recovery and Resilience Plan (PNRR), of which this research is part of.

Results. The main search (not just limited to the agri-food) on the SCOPUS has resulted in an overall number of publications equal to 1654. The descriptive analysis of the scientific literature has shown an increasing trend in both the number of publications and citations. Something to notice is the comparison between the trend of the number of publications, citations and their yearly average; despite, both citations and publications are increasing over time, the rising trend in the yearly average number of citations highlights a rapid decline of the scientific contribution after a few years (otherwise, older publications should have more citations due to the greater number of scientific contributions that followed them). On the other hand, the 4-year lag time between the peak in publications and citations which reflects the average publication period required for full dissemination may represent an issue in a field that evolves so rapidly. Indeed, a quick degree of obsolescence and a relatively slow level of dissemination could compromise the adequacy and usefulness of scientific contributions to the market and empirical applications, which, both in the digital and sustainability realms, are evolving at an exponential rate.

² Further, only documents with the availability of the DOI were kept in the analysis.

Fig. 1: Literature growth trend (all articles and citations)

The analysis on journal productivity shows that the *Journal of Cleaner Production* has a significantly higher number of scientific publications compared to all other journals. However, when we examine the average citations and the impact measure of each journal (measured as the weighted average citations per year), Tables 2 and 3 (in the appendix) demonstrate that the journal does not fall into either classification; the tables show that the most productive journals in terms of overall citations and yearly weighted citations are, respectively, the *MIS Quarterly: Management Information Systems and Group Decision and Negotiations*. However, while the former journal has 9 contributions in this journal, the latter only has one article³ with 197 citations included in the database. The only journals that count more than 5 articles within the top ten performer in the weighted citations list are the “*Journal of Business Research*” and “*Current Issues in Tourism*”.

Tab. 1: Most relevant Journals (in terms of number of articles) – Wide picture

Journal	Num. of articles	Tot. citations	Avg. citations	weighted impact ⁴
<i>Journal of Cleaner Production</i>	260	10015	38,5	1,35
<i>Technological Forecasting and Social Change</i>	34	2144	63,1	2,50

When we move to the thematic analysis constructed through the clustering methodologies identified in the previous sections, we see that the literature appears to be strongly interconnected.

Figure 1 provide a graphical overview of the main thematic clusters that emerged in the review. The reason why the keywords that would have emerged directly from the string that was used in SCOPUS were removed from the graphical analysis is to avoid trivial results; indeed, while it would be obvious to have platform and sustainability as the main outcome variable, the inclusion would have also altered the network interconnection due to the centrality and strength of their linkages.

The 5 most cited keywords, as highlighted in Table 2, are “Sharing Economy”, “Social Media”, “Innovation”, “Circular

³ Lai, L. S., & Turban, E. (2008). Groups formation and operations in the Web 2.0 environment and social networks. *Group Decision and negotiation*, 17, 387-402.

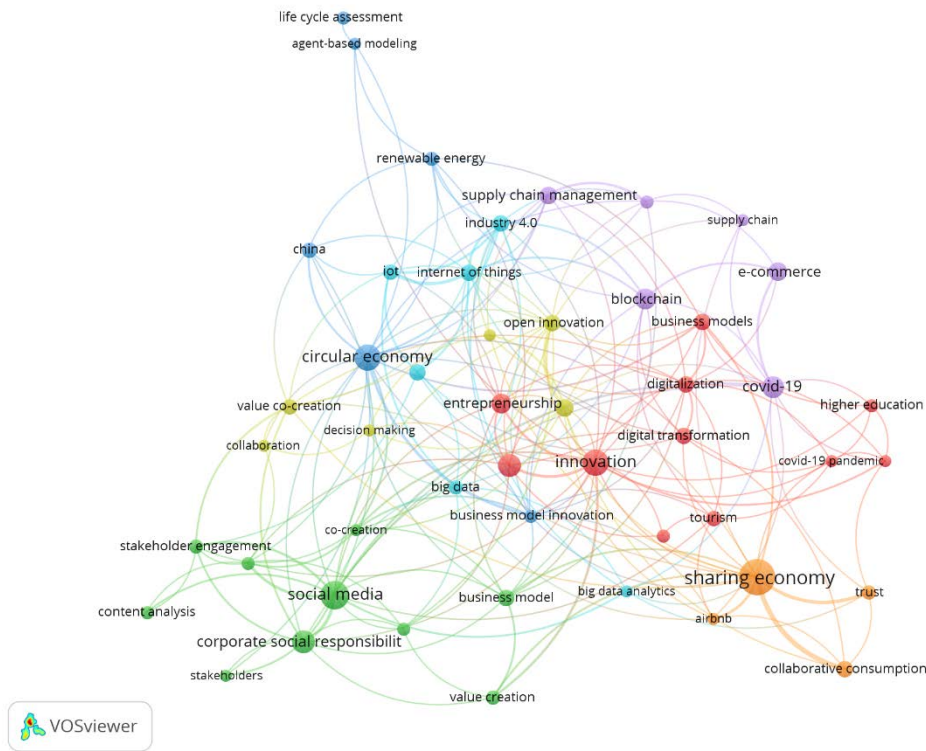

⁴ The weighted impact is constructed by dividing the average citation of the journal in the year by the overall average number of citations in the same year. Then, the final score is constructed as the simple mean of the values for every year.

$$\frac{\sum_{\text{year}} \text{Avg. citations of the journal in the year}}{\text{number of years}} / \text{Overall avg. citation in the year}$$

Economy” and “Crowdfunding”. While Innovation appears to be central in the network, highlighting the main research focus of this literature, the other keywords provide new organizational settings and tools that have gained prominence in the platform economy. The social media cluster is highly interconnected with the theory on stakeholder engagement, showing how this can contribute also to the sustainability field.

Sharing Economy, Circular Economy and Crowdfunding are business models and organizational that can contribute to the three sustainability goals since they contribute to the optimization of resources (financial and non) at different stages of the value chain.

Fig. 2: Keywords co-occurrence

Tab. 2: provides an overview of the most popular keywords

Keywords (all)	Occurrence	Keywords (agri-food)	Occurrence
<i>Sharing Economy</i>	79	<i>Social media</i>	6
<i>Social media</i>	48	<i>Blockchain</i>	5
<i>Innovation</i>	44	<i>Communication</i>	4
<i>Circular Economy</i>	43	<i>Crowdfunding</i>	4
<i>Crowdfunding</i>	34	<i>Iot</i>	4
<i>Corporate Social Responsibility</i>	33	<i>Agent-Based Modelling</i>	3
<i>Covid-19</i>	29	<i>Retailing</i>	3
<i>Blockchain</i>	27	<i>Covid-19</i>	3
<i>Entrepreneurship</i>	23	<i>E-Commerce</i>	3
<i>E-commerce</i>	22	<i>Sharing Economy</i>	3
<i>Supply Chain Management</i>	20	<i>Innovation</i>	3
<i>Crowdsourcing</i>	19	<i>Life Cycle Assessment</i>	3

The Bibliographic coupling analysis highlights a highly interconnected literature that, for obvious reasons, is held together by the concepts of sustainability and platform; however, within the identified clusters, it is possible to identify some themes of greater relevance that can summarize the core aspects of each group.

Within the major cluster (made by 83 articles), "Circular Economy" appears to be a crucial and overarching theme. The second largest group (made by 81 articles) mainly deepen the aspects related to “stakeholder engagement” and its role in fostering sustainable development and ensuring that the interests of various stakeholders are considered in decision-making processes. The third thematic cluster appears to be highly heterogeneous; however, two relevant aspects that emerge in the literature are related to the role of digital capabilities and institutional pressure in influencing sustainable development. The fourth group focuses on the development of digital platforms and the use of technologies for platform development. Several contributions provide empirical evidence on the topic of smart cities and the aid that technologies can bring to urban governance.

Focusing on the most relevant contributions that emerge in the remaining clusters, it is possible to provide further main research themes that are worth to mention. In relation to the relationship with the consumer, the marketing literature has leveraged platforms to create novel customer engagement models, focusing on enhancing environmental and social sustainability. This includes the growing adoption of the sharing economy across various sectors. Moreover, platforms can contribute to the economic sustainability of businesses by fostering consumer engagement and loyalty through initiatives like co-creation projects and crowdfunding.

Fig. 3: Bibliographic coupling

em a.; prinsen p.; vuppala

Focus on the agrifood sector

Digging the analysis into the agri-food industry, we find a relatively large literature as it comprehends 165 out of the overall number of publications (i.e. 10%). However, the literature appears to be highly disconnected, especially when we do not consider the string variable (Figure 4 in the Appendix).

If we consider that the overall literature is ten times larger than the one concerning the analysis of the agri-food industry, we can compare the relative relevance of the concept arising from the study.

While the role of “social media” and “Crowdfunding” appears to be relevant in both sectors, highlighting a proportional interest between the academic communities, the “Sharing Economy” appears to be relatively unexplored within the agri-food sector. Hence, despite some efforts has been made (Michelini et al., 2020; Asian et al., 2019; Moncef et al., 2021), there is space for further debate and opportunities in the agri-food sector in relation to this concept. Further, future research could focus on the role of retailers since none of the literature; indeed, even looking outside the database of analysis, only few and very recent contribution have tried to disentangle some aspects connected to this topic (Mai et al., 2022; Barykin et al., 2021).

Finally, focusing into the more specific task of this research, we analyse the academic contributions that, in this framework, have contributed to the retail industry. Saarijärvi et al. (2024) provides a similar conceptualization of the retailer as a driving force for the sustainable change by looking from a different perspective; indeed, differently from us, the authors use the literatures on reverse use of customer data, gamification, and customer experience to provide the wide context of their study. Another stream of literature focus on the consumer side by

looking at how to influence consumers consumption towards more sustainable standards (Xu et al., 2021; Samoggia et al., 2021). A larger stream of literature provides theoretical and empirical evidence on the potential in the optimization of the logistics and the supply chain management (Paciarotti et al., 2022; Cramer et al., 2023)

Finally, there are contributions aimed at investigating the implementation of the main business model grown throw the intensification of the platform economy in the retail industry; while Konhäusner (2021) provides some evidence on the use of crowdsourcing, Jo et al. (2024) and Mullick et al. (2021) provides insights on the economic, social and environmental efficacy of the digitalization of the retail store through the use of platforms.

Despite the cited literature provides several interesting insights, the relevance of the thematic under study requires a

greater effort in terms of innovation and value generation. For this reason, we believe that this research represents a useful step towards the development of future research lines that, as demonstrated, are currently underdeveloped and could lead to the achievement of the motivating objectives.

Research limitations. The paper has several research limitations. From a technical perspective the dataset could be expanded with additional data sources that could increase the size of the relevant literature and the methodology could be deepened with the systematic analysis, at least for the agri-food area. From a theoretical standpoint, while restricting the research to the confines of the platform concept aligns with our goal of exploring potential value-generating solutions within the currently absent realms of the food supply chain, particularly in relation to the retailer's role, this approach may have overlooked certain specificities associated with the food sector that extend beyond the platform concept. For this reason, future research will be focusing on the specific role of the retailer in driving the sustainable change. However, we believe it is prudent to start with the broader concept to identify unexplored opportunities that might otherwise be missed by narrowing the research focus solely to the specific context of interest.

Managerial implications. The paper provides interesting academic and managerial implications. First, of all, starting from the analysis of the literature on the role of platform as drivers for sustainability, it highlights some differences between the agrifood sector and the other industries. Furthermore, by providing a valuable overview of the potential role of platforms in the transition towards a more sustainable society, it may provide useful business opportunities that the agri-food industry, as well as in other sectors that have not been analysed in this context, could explore.

Originality of the paper. The paper is the first attempt to summarize and identify potential gap in the generation of sustainable value in the platform, and retail, industry. Furthermore, the utilization of a broad-spectrum approach to identify opportunities within a specific niche, although already employed in literature, synthesizes the potentialities of the retail sector that had not been explored from the platform perspective.

The right kiosk across different generations! A quantitative study in the retailing food sector

LUCA CORINALDESI¹ GENNARO IASEVOLI² CHIARA OTTOLENGHI³

Abstract

The aim of this paper is to understand, through a quantitative study, the motivations underlying the use of kiosks while purchasing retailing food products. The study may be interesting because kiosks in the retailing food industry can increase brand loyalty and make a phygital experience more enjoyable.

Methodologically, the study was conducted by carrying out quantitative research with 874 valid surveys. The analysis revealed some significant diversities; in particular, customers positively would use kiosks when ordering food products in order to save time, have personalized discounts and have product combinations. The analysis also reveals generational diversities in terms of use's preferences: the younger segment (Generation Z and Y) is interested in using them in order to speed up the purchase process, while the consumers born in Generation X prefer to have suggestions on product combinations and specific promotions when using kiosks.

From a managerial standpoint, our findings suggest that businesses should undertake precise customer segmentation to identify and cater to the diverse needs of consumers who are inclined to use kiosks during their retailing food purchasing journey. This strategy is imperative for companies aiming to leverage kiosk technology to enhance customer satisfaction and loyalty effectively.

The study opens the door for future research to examine the effects of varying kiosk designs on consumer purchase motivation, advocating for a deeper qualitative exploration into the attitudes of those engaged with phygital experiences. This investigation not only contributes to the academic literature by offering novel insights into consumer motivations for using food purchasing kiosks but also provides practical guidance for businesses looking to adapt to and capitalize on the evolving retail landscape.

Key words: *Phygital; Kiosk; Generational study; Quantitative analysis; Customer experience; Self-service technology.*

Framing of the research. *In recent years, numerous studies have highlighted a marked increase in the velocity of various industries, attributing a significant portion of this growth to the emergence of the phygital concept. This concept exemplifies the merging of physical and digital realms, evident in practices such as online ordering with subsequent in-store pickup or home delivery (Wu and Wu, 2015). Research conducted in Italy (IISole24Ore, 2021) reveals that a considerable 74% of consumers have engaged in phygital purchasing activities in recent times.*

Present-day businesses are actively pursuing the creation of integrated customer experiences that bridge the digital and physical domains, thereby enriching the quality of the shopping journey. The phygital phenomenon mirrors the current consumer dilemma-balancing the allure of traditional shopping with the efficiencies of digital channels. This shift represents a significant transformation in socio-economic practices (IISole24Ore, 2021), driven by the digital sphere's capacity to cater to consumer needs with innovative services and practices that have become indispensable. A majority of Italian shoppers are of the opinion that digital innovations could significantly enhance the retail experience, through in-store promotions, product discovery, and navigation assistance, along with the provision of personalized service offerings. The essence of a phygital customer experience transcends mere dissatisfaction resolution, aiming instead to discover and orchestrate moments of profound significance and delight in the consumer journey.

Despite the scarcity of scholarly attention towards the phygital impact on the retailing food industry, a growing body of businesses within this realm are adopting phygital strategies in response to escalating consumer demand. Recent findings indicate that 37% of individuals express interest in experiencing a phygital culinary venture (IISole24Ore, 2024a), leveraging virtual and augmented reality to enrich the dining ambiance with customized lighting, fragrances, and auditory elements, thus enhancing the engagement with culinary heritage. The retailing industry is increasingly gravitating towards phygital engagements to captivate a broader audience. According to further studies (IISole24Ore,

³ LUMSA University
e-mail: c.ottolenghi@lumsa.it

2024b), an anticipated 70% of restaurateurs in 2024 will expand their use of chatbots and content generation tools for more personalized customer interactions. The cornerstone of contemporary restaurant success lies in technological innovation, encompassing advanced digital menus, social media platforms, booking and payment applications, and notably, kiosks that offer multifaceted assistance to patrons (IISole24Ore, 2024b).

The introduction of interactive kiosks in retailing demonstrates the dual benefits of increased sales and improved customer experiences. These interactive kiosks offer greater control and customization of orders to customers, reduce waiting times, and enable retailers to serve more customers during peak hours, thereby easing the workload on staff and enhancing overall customer satisfaction (Akcarn, 2020). Moreover, the research emphasizes the necessity of balancing efficiency with the enjoyment aspects of shopping, underlining the importance of a phygital strategy that transcends mere transactional interactions to deeply understand and cater to the real reasons' customers utilize kiosks (Kim et al., 2023).

Building on these premises and the fact that consumers are increasingly interested in the phygital world, digital advancements could enhance the in-store shopping experience by spotlighting offers and promotions within the physical store, facilitating product search and navigation, it was decided to delve deeper from a general perspective and then specifically investigate the generational differences in the motivations behind consumers' use of phygital tools like kiosks when purchasing retailing food products. Therefore, the objective of this study is to understand, through a quantitative analysis, the motivations underlying the use of kiosks in the purchase of retailing food products.

Purpose of the paper. Interactive kiosks are key to phygital retailing, which is designed to provide a seamless customer experience by integrating multiple online and offline retail channels (Batat, 2022). They enhance the shopping experience by directly engaging consumers, offering them autonomy, reducing their waiting time, and boosting their satisfaction and sense of empowerment (Del Vecchio et al., 2023). For example, at a kiosk, customers have the ability to place a physical item onto a digital display to access comprehensive details such as the item's features, available stock, color options, and sizes, and to make comparisons with other products on the same screen (Banik, 2021). The effectiveness of phygital kiosks in retail is further underscored by their role in mitigating risk issues and engaging customers more deeply with the retail environment, promoting a positive attitude towards technology acceptance, enriching the overall phygital retail experience. By providing adequate information and ample trial options, phygital retail stores encourage customers to spend more time evaluating products, thereby improving their knowledge and decision-making confidence (Banik, 2021). Interactive kiosks are also utilized as self-checkout stations in retail, streamlining the checkout experience. These kiosks are designed to eliminate the need for manual barcode scanning by consumers. Instead, customers can place their items on a specific part of the kiosk, where a radio-frequency identification (RFID) tag attached to the product is automatically read, seamlessly gathering price and product information. This approach not only reduces in-store queues but also significantly cuts down on wait times, enhancing the efficiency and overall quality of the shopping journey (Bonfanti et al., 2023).

Phygital technologies are employed to optimize the efficiency of the shopping experience. Yet, the research conducted by Guzzetti et al. (2024) points out that focusing solely on practical features may diminish the entertaining aspects of shopping, which indicates the importance of striking a balance between functionality and enjoyment to boost customer satisfaction and involvement in retail environments. In the luxury sector, empirical findings confirm that interactive storefronts can enhance hedonic value in luxury retail stores, supporting the idea that luxury brands may create multiplatform storytelling experiences (Lawry, 2022). For instance, the "Next Era" experience by Valentino and the "My Gommino" interface from Tod's demonstrate how interactive kiosks not only allow customers to instantly browse and buy products from global inventories but also to participate actively in designing their own custom (Newman, 2017). This evolution turns retail spaces into venues where luxury fashion consumers can display their knowledge and dominate the luxury shopping scene, all in pursuit of fulfilling their desires for enjoyment (Lawry, 2022). Smart mirrors in Thom Browne's fitting rooms represent another innovative example. These mirrors enhance the shopping experience by identifying products, suggesting merchandise pairings, and proposing customized looks (Kansara, 2017). They provide shoppers with instant satisfaction, allowing them to define their style on their own terms, without waiting for feedback from a salesperson or relying on them to fetch more items from the sales floor (Lawry, 2022).

In the food service industry, the adoption of on-site self-service technologies, such as tablets and kiosks, has transformed the way services are delivered, enhancing efficiency and customer satisfaction (Pai et al., 2022). Between 2018 and 2021, the adoption of self-service kiosks in restaurants rose significantly from 1.7% to 5.5%, indicating a broader trend towards automation and technology adoption within the retailing food service industry. This shift led to a greater reliance on touchless services (Yoon, 2023). Interactive kiosks in quick-service restaurants present menu options for customers to choose from, offer deals based on the customer's selections, and process payments. Similar to a traditional register manned by a cashier, the kiosk forwards the completed order to the kitchen's computer system once payment has been made. At establishments like McDonald's, the introduction of interactive kiosks combined with mobile ordering apps has led to an increase in sales, improved customer experience by offering greater control and customization of orders and has helped reduce waiting times. Furthermore, these technologies have enabled restaurants to serve more customers during peak hours, easing the workload on staff and enhancing overall customer satisfaction (Akcarn, 2020). Restegar et al. (2021) investigated customer perceptions of self-service kiosks in quick-service restaurants. Their study aimed to understand factors driving customer use and developed a model integrating the Technology Acceptance Model (TAM) and satisfaction models to analyze customers' behavioral intentions. Using an online survey of McDonald's customers, they found that perceived usefulness and trust significantly affect user enjoyment and satisfaction (Restegar et al., 2021). In the study made by Na et al. (2021) it has been extended the inquiry to the realm of demographic influences, specifically gender, on the adoption and continued use of self-service kiosks. Their research scrutinizes different aspects

of the Technology Readiness Index (TRI) aspects (optimism, innovativeness, discomfort, insecurity) and the intention to continue using self-service kiosks in restaurants. They found that innovativeness and optimism enhance, while discomfort decreases, the intention to keep using kiosks. Insecurity didn't significantly affect usage intentions. Importantly, gender was a key factor, with men more likely to continue using kiosks than women, especially regarding the impact of innovativeness on usage intentions, suggesting gender-specific considerations in kiosk design and implementation. Furthermore, Marinakou et al. (2023) conducted an investigation into the factors affecting customer satisfaction and their willingness to reuse self-service kiosks in Bangkok's fast-food industry. Utilizing a quantitative method, the study gathered data through an online survey, reaching a diverse demographic in terms of age and prior kiosk experiences. The findings indicated a significant acceptance and satisfaction with kiosk technology, suggesting that users are inclined to use it again. However, the study did not specifically examine how customer experiences and satisfaction with self-ordering kiosks differ across age groups (Marinakou et al., 2023). Moreover, Kim et al. (2023) research, which aimed to explore how self-service kiosks affect customer experiences and intentions to revisit quick-service restaurants, provides crucial insights into the factors driving consumer use of self-service kiosks. Gender-specific analysis indicates a disparity in attribute weighting for kiosks between men and women. Men are shown to favor customization to a greater extent, whereas design holds more significance for women. However, the outcome of the analysis suggests that enjoyment is valued by both men and women alike. Despite restaurants being praised for their health security measures, they were criticized for lacking in design and enjoyment aspects, with a notable impact on improving the kiosk experience for female customers (Kim et al., 2023). This research suggests that the retailing food sector, akin to the luxury sector, should adopt a phygital strategy that transcends efficiency by deeply understanding the real reasons customers utilize kiosks.

The current body of literature highlights significant interest in incorporating kiosks into phygital strategies, appealing to a broad audience. Although some studies suggest variations in technology adoption, it is important to note that there is not sufficient research to conclusively determine preferences across different age groups. Exploring the factors that impact customer loyalty towards quick-service retail outlets, particularly through the use of kiosks, and examining the variation in these motivational factors across different generations are essential for acquiring a more profound understanding of how phygital strategies can be effectively implemented within the retailing food industry. Basing on these premises, we developed the research questions as follows:

RQ1: Does the degree of interest in kiosks vary across different generations?

RQ2: To what extent does a positive attitude towards technology influence customers' motivation to use kiosks for purchasing retailing food products?

RQ3: How does the motivation for using kiosks to buy retailing food products vary across different generations?

Methodology. To better explore the phenomenon and address the research questions, a quantitative analysis was conducted by administering a questionnaire to 874 respondents. This analysis was performed using SPSS v. 28 software and involved first conducting an independent sample T Test to compare the means of two distinct groups to determine if significant differences exist between them. Additionally, a repeated-measures ANOVA analysis was conducted, as this method allows for the examination of differences between means within pairs using a single inferential test, thereby revealing which variable is most influential and where significant differences may be found. Finally, a regression analysis was performed to understand the relationship between a dependent variable and one or more independent variables. Methodologically, this quantitative study has been conducted through the administration of a survey in December 2023 through Google Forms. Participants were not incentivized and were contacted by social platforms. For data collection, a 20 questions' survey organized into different sections was administered. In order to offer an easier way to answer to questions, we used for some of them a Likert-type scale with a range of 1 to 7 where 1: Strongly disagree and 7: Strongly agree (Ayyildiz et al., 2022).

Following there are the details of the questions we are going to analyze in this paper. In order to understand the degree of interest of using technologies, we asked respondents how much they would be interested in using technology to ease their purchase; they had the possibility to answer based on the Likert scale mentioned above.

The survey construction was undertaken subsequent to a careful review of the pertinent literature, with a focus on identifying analyses deemed interesting from the authors' perspective. To comprehend the motivations toward the use of kiosks when ordering or buying in retailing food shop, we conducted additionally an empirical analysis on retailing companies offering kiosk experiences and a literature analysis on papers regarding this topic (Banik, 2021; Baratta et al., 2022). Building upon this empirical and literature analyses it was asked (on the 7-level Likert scale) which motivations would respondents be interested when using kiosks: 1. Speed up the ordering process; 2. Speed up the combination of products; 3. Calculate calories; 4. Offer additional products; 5. Show QR codes with personalized information; 6. Show QR codes with personalized discounts; 7. Offer specific product combinations; 8. Offer specific promotions.

The survey's questions were tested by three academic experts and two managers who had experience in phygital research.

Participants were contacted, initially through LinkedIn, Facebook, WhatsApp, and email, to provide information about the research project and invite completion of a questionnaire administered online. This means that we reached people from different socio demographic backgrounds. Each respondent was more than 18 years old. The survey was sent with the information about the purpose of the research and an introductory message was used to assure respondents of the anonymity of all data and the confidentiality of the study (Chang et al., 2010). All individuals who, at the time of

the survey, were of legal age and had utilized a kiosk in the last 6 months in the retailing, were considered ideal respondents.

Totally, 1000 surveys were collected of which 126 were discarded because they were not complete. Thus, the total number of valid answers was 874.

The sociodemographic characteristics of the investigated sample are shown in Table 1.

Table 1: Sociodemographic characteristics of the sample

	Characteristics	Number of times (n=874)	Percentage (%)
Gender	Female	558	64%
	Male	316	36%
Age	1996-2004 (GEN Z)	641	73%
	1981-1995 (GEN Y)	100	12%
	1965-1980 (GEN X)	133	15%

Results. To address the first research question, and understand if the degree of interest in kiosks vary across different generations, we have done a T independent test considering as variable of the test the degree of interest in using kiosks and as grouping variables the different generations (Generation Z, Generation Y and Generation X). As showed in table 2, there is a significant difference only between the Generation Z and Generation X respondents. Meaning that between the other generation cohorts there were not important difference.

Table 2: T Test of the degree of interest in kiosks across different generations

Variables	F	Sign.
Gen Z Vs. Gen Y	1.698	0.193
Gen Y Vs. Gen X	0.223	0.637
Gen Z Vs. Gen X	4.483	0.035

In order to answer the second research question, and understand to what extent a positive attitude towards technology influences customers' motivation to use kiosks for purchasing retailing food products, it is pertinent to identify the motivations driving customers to seek a phygital experience through the use of kiosks when purchasing retailing food products. Therefore, a repeated-measures ANOVA has been made to control and test the differences between the following 8 variables (Speed up the ordering process; Speed up the combination of products; Calculate calories; Offer additional products; Show QR codes with personalized information; Show QR codes with personalized discounts; Offer specific product combinations; Offer specific promotions), with the dependent variable regarding the appreciation of the use of technology for making purchases. Each variable considered, as shown in table 3, is significant.

Table 3: Motivations toward using kiosks

Variables	F	Sign.
Speed up the ordering process	34.554	<.001
Speed up the combination of products	24.800	<.001
Calculate calories	9.971	<.001
Offer additional products	21.866	<.001
Show QR codes with personalized information	22.311	<.001
Show QR codes with personalized discounts	28.729	<.001
Offer specific product combinations	23.888	<.001
Offer specific promotions	23.364	<.001

To determine to what extent a positive attitude towards technology influences customers' motivation to use kiosks for purchasing food products and therefore answer deeper to RQ2, we carried out a linear regression analysis where the appreciation of the use of technology for making purchases is the dependent variable and the 8 variables are the independent ones. The regression model is significant, $F(8;865) = 32.987$; $p < .001$, with an R2 equal to .234. Furthermore, as shown in the left part of table 4, three ("Speed up the ordering process", "Show QR codes with personalized discounts" and slightly significant "Offer additional products") out of the eight variables have a positive and significant Beta value on the appreciation of the use of technology for making purchases, indicating that they positively would use kiosks in order to first of all save time, have personalized discounts and have additional products offered.

To answer RQ3, we thought it intriguing to ascertain whether, based on different generations, any variable stood out as particularly noteworthy. Thus, we conducted a regression analysis across various generational cohorts. All the regressions are significant. For the Generation Z, specifically those born between 1996-2004, the regression model is significant, $F(8;632) = 22.534$; $p < .001$, with an R2 of .222. Moving to Generation Y, born from 1981-1995, the regression model is significant, $F(8;91) = 13.257$; $p < .001$, with an R2 of .255; Generation X, born between 1965-1980, also shows a significant regression model, $F(8;124) = 9.172$; $p < .001$, with an R2 of .372.

As it can be observed in table 4, each generation exhibits distinct preferences regarding their motivations for using kiosks when making a food product purchase. The Generation Z demonstrates a preference for “Speed up the ordering process,” “Offer additional products.” and “Show QR codes with personalized information”. Generation Y, on the other hand, reaffirms the interest in “Speed up the ordering process” and also exhibits interest in “Show QR codes with personalized discounts”. Finally, it is noteworthy that those born in Generation X “Offer specific product combinations” and “Offer specific promotions”.

Table 4: Regression model between technology’s appreciation and motivation variables based on different generation

Variables	General			1996-2004			1981-1995			1965-1980		
	Beta	F	Sign.	Beta	F	Sign.	Beta	F	Sign.	Beta	F	Sign.
Costant		10.703	<.001		7.898	<.001		3.602	<.001		5.388	<.001
Speed up the ordering process	0.250	5.305	<.001	0.249	4.734	<.001	0.302	2.285	0.025	0.289	1.718	0.088
Speed up the combination of products	0.031	0.626	0.531	-0.008	-0.139	0.890	0.121	0.838	0.404	0.129	0.741	0.460
Calculate calories	-0.062	-1.638	0.102	-0.066	-1.545	0.123	-0.093	-0.781	0.437	0.095	0.771	0.442
Offer additional products	0.087	1.923	0.055	0.119	2.295	0.022	0.075	0.522	0.603	-0.107	-0.859	0.392
Show QR codes with personalized information	0.075	1.590	0.112	0.103	1.976	0.049	-0.236	-1.338	0.184	0.052	0.380	0.705
Show QR codes with personalized discounts	0.128	2.314	0.021	0.074	1.206	0.228	0.394	2.185	0.031	0.077	0.465	0.642
Offer specific product combinations	0.089	1.721	0.086	0.043	0.736	0.462	0.066	0.380	0.705	0.416	3.014	0.003
Offer specific promotions	-0.041	-0.735	0.463	0.040	0.659	0.510	-0.136	-0.665	0.507	-0.314	-2.114	0.037

Significant diversity emerged from the analyses. Regarding the degree of interest in using kiosks across different generations, there is a significant difference only between the Generation Z and Generation X respondents. Concerning motivation toward using phygital devices, all variables considered in the ANOVA analysis were found to be significant for respondents; moreover, as resulted from the regression analysis three out of the eight variables have a positive and significant Beta value on the appreciation of the use of technology for making purchases, indicating that they positively would use kiosks when ordering food products in order to save time, have personalized discounts and have additional products offered. In addition, in terms of how generations exhibit distinct preferences regarding their motivations for using kiosks when making a retailing product purchase, Generation Z and Y are interested in using them in order to speed up the purchase process, while Generation x does not exhibit interest in saving time. This means that as age decreases, the interest in using kiosks to save time increases. Regarding other motivations, Generation Z demonstrates a preference also for having additional products offered and have personalized information. Generation Y, on the other hand, exhibits interest in having personalized discounts. Finally, Generation X would like to have offers with specific product combinations and specific promotions.

Research limitations. The study has the merit of contributing to the advancement of knowledge related to the topic of phygital, specifically kiosks, in the retailing food industry, a topic that is still under-researched in the literature. However, the interpretation and generalization of the results presented must take into account some limitations. First, the sample may not be representative of the Italian population, and the analysis did not take a cross-sectoral approach. Moreover, some types of motivations to use kiosks were tested only by few academic experts and managers who had experience in phygital research.

Managerial implications. In terms of managerial implications, the consistency of findings and the data collection methods underscore the necessity for food retailing companies to strategically comprehend and harness consumer motivations for utilizing kiosks in purchasing their food products.

Key insights reveal that consumers are primarily motivated by the willingness to buy other related products, the possibility to save time and to offer customer personalized discounts, while the methods of phygital often affect both the cost and time of supply as well as generate new challenges related to the management of a more complex and changing environment. These factors not only enhance the customer experience but also serve as pivotal elements in driving sales and fostering brand loyalty. Through these results, enterprises can develop and offer additional products, personalized discounts, and promotions that appeal to different generational preferences. Retailers can consider integrating kiosk technology in their stores, especially targeting younger generations, to enhance the shopping experience and increase customer engagement.

Originality of the paper. Phygital experiences are developing very fast in the last years among businesses, including in the retailing food industry. The adoption of interactive kiosks has led to significant benefits, including increased sales, improved customer experiences, and enhanced operational efficiency. Moreover, studies such as those by Rastegar et al. (2021) and Na et al. (2021) underscore the importance of understanding customer perceptions and demographic influences on technology adoption to maximize the effectiveness of kiosks.

However, especially in the retailing food industry, the use of kiosks by consumers often concerns the possibility to save time, have personalized discounts and have product combinations. Kiosks thus become instrumental in creating customer value and for this reason they are increasingly developed by retailing food restaurants, especially when they are point of a chain

Retail Internationalization and Innovation: A systematic literature review

MICHELE BADOLATO¹

Abstract

Retail internationalization (RI) has garnered significant scholarly attention since the late 1980s, yet a comprehensive systematic review of the literature remains lacking. Building upon previous efforts, this paper undertakes an exhaustive examination of RI literature spanning three decades. Through bibliographic, network, and cluster analyses, we aim to elucidate key themes, trends, and gaps within the discourse. Notably, our study tries to extend beyond summarization to explore the underexplored potential link between retail internationalization and innovation. Addressing three central research questions, we interrogate the current state of RI literature, assess the integration of innovation therein, and propose future research directions. Our methodological framework, informed by established systematic review protocols, ensures rigor and comprehensiveness. The findings highlight temporal patterns, influential authors, leading journals, and thematic clusters within the RI literature. Moreover, the analysis identifies a burgeoning interest in digital commerce and innovation, underscoring a crucial area for future inquiry. Ultimately, this paper contributes to advancing understanding and guiding future research endeavors in the dynamic field of retail internationalization, with few managerial implications.

Please note that this paper is still a work in progress and the results are not definitive. Future work around the link between internationalization and innovation is needed.

Key words: Retail internationalization; literature review; bibliometric analysis; network analysis; cluster analysis; innovation

Framing of the research. Retail internationalization (RI) has been a subject of extensive discussion in academic literature since the late 1980s and early 1990s. Despite this prolonged interest, only a limited number of papers have undertaken a systematic review of the literature in this specific domain. Notably, Dimitrova et al. (2018) made a commendable attempt at such a review, focusing on a pre-selected sample of 89 papers spanning from the 1970s to 2016. By doing this study they focused their attention primarily in the following research areas: retail internationalization drivers and impediments, strategies, and performance.

However, to gain a comprehensive understanding of the evolution and nuances within the RI discourse, it is imperative to conduct a thorough and exhaustive review of the existing literature. By doing so, we can mitigate initial biases in paper selection and subsequently identify clusters that encapsulate the main areas of investigation within the RI literature.

Moreover, our interest extends beyond merely summarizing the existing literature. We aim to delve deeper into recent developments, particularly focusing on the role of innovation in the retail internationalization strategy. Innovation has emerged as a critical factor shaping the dynamics of global retail operations, yet its integration into the discourse of RI remains underexplored.

Therefore, this study endeavors to address the following research questions:

RQ1. What is the current state of the literature on retail internationalization, and what key themes and trends have emerged over time?

RQ2. To what extent has the literature explored the relationship between retail internationalization and innovation? What gaps exist in this area of research?

RQ3. What are the potential future directions for research in the field of retail internationalization, particularly concerning the integration of innovation into strategic frameworks?

Purpose of the paper. By addressing the aforementioned research questions, our aim is to make a meaningful contribution to the ever-evolving landscape of retail internationalization, thereby providing valuable insights into potential avenues for further exploration and development in this field.

The ultimate objective of this paper is twofold: firstly, to deepen understanding of the research topic by delving into its key areas of study and focusing on its evolution over the past three decades through bibliographic, network, and cluster analyses. Secondly, we endeavor to uncover potential connections between retail internationalization and innovation, while also surveying existing literature to ascertain what has already been explored and documented in this realm.

Methodology. In accordance with the seminal work "Systematic Reviews and Meta-Analysis" by Littel et al. (2008), our systematic literature review was conducted following a meticulously organized, transparent, and replicable process. This methodological framework consisted of a structured 5-step program, designed to ensure methodological rigor and comprehensiveness in our review:

1. *Database and Keywords Selection:* We began by selecting Scopus as our primary database, a choice informed by its extensive coverage across various disciplines and journals. Employing Boolean operators and wildcards, we meticulously curated a set of keywords to capture the essence of our research inquiry. Notably, we leveraged wildcard symbols (*) to encompass variations of key terms, such as "retail*" and "international*," ensuring inclusivity of relevant literature across article titles, abstracts, and keywords.
2. *Database Search:* Our initial database search involved amalgamating selected keywords using the Boolean operator "AND," coupled with additional criteria specifying English language articles published within the past three decades (1994 to 2024). This broad search yielded a considerable volume of 4,309 papers. However, upon preliminary assessment, it became evident that the scope was overly expansive and heterogeneous.
3. *Filtering Articles per Keywords and Area:* Recognizing the need for refinement, we conducted a second, more targeted search. This involved refining our search parameters to exclusively retrieve articles featuring the keyword "retail*" in their titles, while replacing the wildcard-enhanced "international*" with the precise term "internationalization." We focused our attention on the specific subject area Business, Management and Accounting. Consequently, this approach yielded a more manageable subset of 223 documents.
4. *Selecting Articles by Reviewing Titles/Abstracts:* To further streamline our dataset, we meticulously scrutinized the titles and abstracts of retrieved articles. Through this process of meticulous review and exclusion, we distilled our dataset to 193 papers deemed most pertinent to our research objectives.
5. *Final Selection by Reading Articles in Full:* The final stage of our literature review entailed a thorough examination of the full texts of the selected articles. By engaging in comprehensive reading and analysis, we identified and retained 170 documents that offered the most relevant insights and empirical findings pertaining to our research focus.

We proceeded to create a database with these 170 articles and for each of them we collected title, authors, year of publication, publication journal, abstract, number of citations, and keywords. For simplicity the number of citations were collected from Scopus (on February 28th). Higher values in terms of number of citations could be find if we look at the same articles on Google Scholars.

Armed with this curated dataset, facilitated by the Zotero reference management program, we proceeded to conduct a comprehensive bibliometric analysis. This analysis encompassed both descriptive, network and cluster-based approaches, aimed at uncovering key trends, patterns, and interrelationships within the literature on retail internationalization (RI).

For the descriptive analysis, we utilized a combination of Microsoft Excel and PowerBI to explore various facets of RI research, including prominent journals, publication trends over time, influential papers, and prolific authors. Additionally, we employed network analysis techniques, employing software such as VOSViewer, to visualize co-authorship networks and co-occurrence of keywords.

Building upon the work of Dimitrova et al. (2018), we adopted a clustering approach to categorize RI literature into distinct thematic clusters. Through meticulous examination of article content, we delineated four primary clusters focusing on RI Process, RI Strategy, RI Performance, and RI Success/Failure. This nuanced analysis not only elucidated the prevailing themes within the literature but also shed light on potential research gaps and avenues for future inquiry. Additional information was extracted from the papers about the sectors and countries studied.

Results. This section presents the results of the descriptive, network, and cluster analyses conducted to fulfill the objectives of this study.

Descriptive Analysis

Publication Distribution Across Journals

Out of the final sample of 170 articles on retail internationalization, an examination of publication distribution across journals provides valuable insights. Figures 1 and 2 depict the distribution of publications and citations per journal, respectively.

Figure 1 illustrates the dominance of the "International Review of Retail, Distribution and Consumer Research" journal, which boasts the highest number of publications with 28 distinct papers. This prominence is notably ahead of the second-ranked "International Journal of Retail and Distribution," which published only 14 papers.

Figure 1 - Main Journals per n. of publications.

Figure 2 showcases the citation performance of these journals. Despite its lower publication count, the "International Marketing Review" journal emerges as a leader in citations, accumulating 947 citations across 13 published articles. Following closely behind is the "International Review of Retail, Distribution and Consumer Research," with 868 citations.

Figure 2 - Main Journals per n. of citations.

The top five journals, ranked by the number of citations, are the "International Marketing Review," "International Review of Retail, Distribution and Consumer Research," "International Journal of Retail & Distribution Management," "European Journal of Marketing," and "Journal of International Marketing."

Temporal Trends in Publication

A temporal analysis of publication trends sheds light on the evolving interest in retail internationalization. As depicted in Figure 3, the distribution of publications over the years reveals notable patterns.

Figure 3 - Number of Publications per Year

The data indicates that recent years have not witnessed a surge in publications on retail internationalization, with only 10 out of 170 papers published since 2020. Similarly, the 1990s saw relatively modest activity in this research domain, with 20 articles published between 1994 and 1999.

The most prolific period in retail internationalization research occurred between 2004 and 2014, during which 94 out of 170 papers were published. Notably, 2007 emerged as a standout year in terms of publications, with 12 articles contributing to the scholarly discourse in this field.

To fulfill the aim of the paper, the results of the descriptive, network and cluster analysis are presented in the following section.

Leading research in Retail Internationalization

Following the selection criteria of articles with more than one hundred citations, our analysis narrowed down to thirteen articles out of the initial pool of 170. These significant contributions represent pivotal works that have garnered substantial scholarly attention within the field of retail internationalization. The complete list of these influential articles is provided in Table 1 below.

Table 1 - Top Articles per n. citations

Article Title	Citations
Internationalization of retailing operations	214
The retail internationalisation process	155
Psychic distance: Antecedents, retail strategy implications, and performance outcomes	153
Failure in international retailing: Research propositions	145
Lessons learned from unsuccessful internationalization attempts: Examples of multinational retailers in Chile	137
Brands without boundaries – The internationalisation of the designer retailer’s brand	134
Psychic distance and the performance of international retailers: A suggested theoretical framework	133
Corporate Branding, Retailing, and Retail Internationalization	130
Flagship stores as a market entry method: The perspective of luxury fashion retailing	130
The role of store image in retail internationalisation	126
Power and control in international retail franchising: Evidence from theory and practice	123
International expansion of retail firms: a theoretical approach for future investigations	116
Retail internationalization and retail failure: Issues from the case of Marks and Spencer	115

Among the selected articles, one standout piece is "Internationalization of Retailing Operations" by Dawson, J.A., published in 1994. This seminal work has surpassed 200 citations, solidifying its status as a foundational pillar in the theoretical development of the retail internationalization process. Dawson's paper delineates the definition of international retail operations, emphasizing its operational scope across multiple countries. Furthermore, Dawson delves into the underlying motives driving internationalization, drawing upon Dunning's seminal work (1981, 1988) to elucidate the key factors: owner-specific advantages, location-specific advantages, and internationalization advantages. Additionally, the paper critically evaluates various mechanisms of internationalization, including internal expansion, mergers or takeovers, and franchising, while also tracing the trajectory of major retailers' internationalization efforts from the 1970s to the 1990s.

Another noteworthy contribution is the work of Evans, J. et al. (2008), titled "Psychic Distance: Antecedents, Retail Strategy Implications, and Performance Outcomes." In this study, the authors present a comprehensive conceptual model elucidating the intricate relationship between psychic distance and organizational performance within the retail sector. Integrating organizational factors such as international experience and decision-making centralization, alongside entry strategy considerations and retail strategy implications, the model offers valuable insights for retailers navigating psychically distant markets. The findings underscore the importance of adopting low-cost/low-control entry strategies and adapting retail strategies to align with market dynamics in psychically distant environments. However, the study also highlights the potential performance implications associated with such strategic responses.

Network Analysis Co-authorship analysis

To conduct the co-authorship analysis, we utilized the Zotero program to generate RIS files, facilitating the integration of all 170 articles into the VOSviewer software. The following configurations were applied in VOSviewer to generate visual maps, as depicted in Figure 4 below:

1. Map Based On: Bibliographic Data
2. Read Data From: Reference Manager Files RIS
3. Type of Analysis: Co-authorship
4. Unit of Analysis: Authors
5. Counting Method: Full Counting
6. Minimum Number of Documents of an Author: 2 and 3
7. Number of Authors Selected: Total Number of Authors
8. Show: All Items

Among the 232 authors included in the analysis, 66 and 30 authors met the specified thresholds of 2 and 3, respectively.

The co-authorship analysis unveils a robust core of research activity in retail internationalization primarily concentrated between 2000 and 2010. Within this network, certain authors emerge as particularly influential, notably Alexander, N., Burt, S., and Hutchinson, K.

Figure 4 - Co-Authorship analysis

As just mentioned, Nicholas Alexander, a Professor of Marketing at Lancaster University (England, UK), stands out as a prominent figure in this domain. As of March 13, 2024, his Google Scholar profile reflects an impressive citation count of 6,209, with an h-index of 41 and an i10-index of 66. Alexander's research interests predominantly revolve around international retailing and retail marketing. Noteworthy collaborations include strong research ties with Barry Quinn from Ulster University (Northern Ireland, UK) and Annie Marie Doherty from the University of Strathclyde (Scotland, UK).

Ulterior emerging networks have surfaced in recent years, driven by authors such as Mccoll, J., Moore, C., and Kim, S. However, these networks are relatively small and closed, indicating the potential for further collaboration to enhance the dissemination, application, and advancement of knowledge in this field.

Keywords analysis

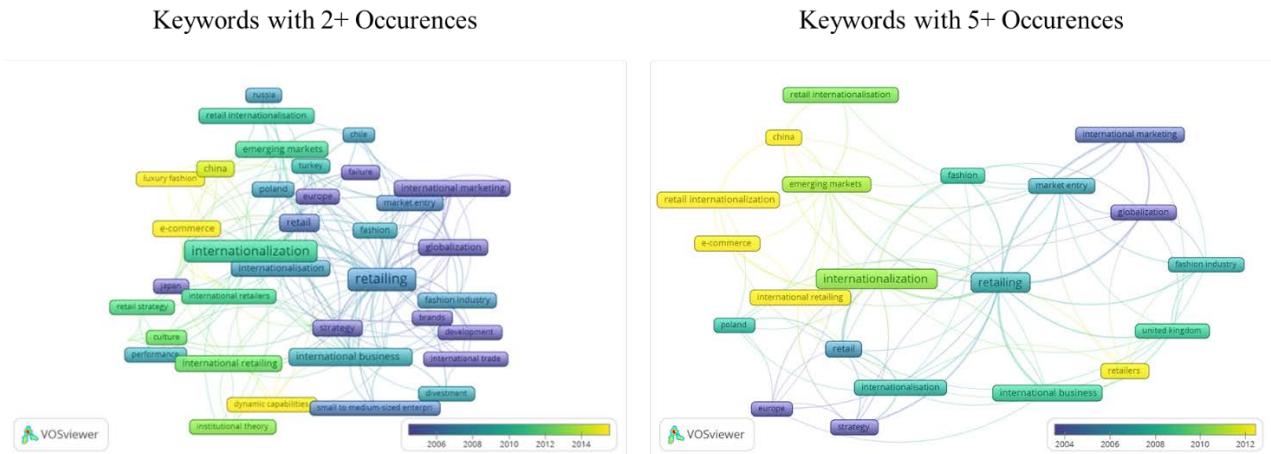

In parallel to the co-authorship analysis, we conducted a keyword analysis utilizing the VOSviewer software, which help us in the creation of the visual maps illustrated in Figure 5. The following settings were applied:

1. Map Based On: Bibliographic Data
2. Read Data From: Reference Manager Files (RIS)

3. *Type of Analysis: Co-occurrence*
4. *Unit of Analysis: Keyword*
5. *Counting Method: Full Counting*
6. *Minimum Number of Occurrences of a Term: 2 and 5*
7. *Number of Terms Selected: Total Number of Items*
8. *Show: All Items*

Among the 403 terms analyzed, 91 and 21 terms were selected based on the thresholds of 2 and 5 occurrences, respectively.

Figure 5 - Keywords analysis

Beyond the expected keywords such as "internationalization" and "retailing," our analysis reveals the presence of different countries or regions as significant focal points. Notably, terms such as "Europe," "Poland," "United Kingdom," "China," and "emerging markets" emerge as prominent co-occurring keywords. A nuanced examination of the most frequently occurring terms reveals distinct temporal trends. For instance, the focus on European regions is evident primarily during the early 2000s, whereas research interest in China and emerging markets becomes pronounced only after 2010.

Furthermore, keywords such as "performance," "divestment," "market entry," "globalization," and "strategy" feature prominently in the analysis, indicating key thematic areas within the literature on retail internationalization. Notably, the last three terms mentioned above also emerge from the network analysis of keywords with five or more occurrences, underscoring their significance within the scholarly discourse.

Of particular interest for our systematic literature review in retail internationalization is the emergence of the keyword "e-commerce." This term, appearing predominantly in recent years, particularly after 2014, reflects a growing scholarly interest in the intersection of retail internationalization and digital commerce. Interestingly, only this term stands out as a keyword potentially correlated with innovation, highlighting a notable gap in the current literature. While this analysis provides just a high-level overview of the thematic focus of various papers, it suggests that innovation remains relatively underexplored within the context of retail internationalization.

Cluster Analysis

Following the process made by Dimitrova et al. (2018), we have developed a cluster analysis in which we have divided our sample of articles in 4 different groups: RI Process, RI Strategy, RI Performance and RI Success/Failure

The clusterization is very broad in order to comprehend almost all of the documents gathered, in fact we proceeded in excluding just two papers which are literature reviews of the argument. A complete list of papers analysed and grouped in the different categories can be found in the Appendix.

RI Process

51 papers out 170 falls in this category. The cluster of retail internationalization process comprehend all the documents that want to:

1. Give a theoretical approach or framework to the topic; or
2. Study the whole internationalization process for a specific geographical region or industry; or
3. Discuss drivers or impediment to the internationalization process.

We can say that this cluster represent the base of the research, considering that contains all the papers that try to give a broader overview of the topic and are not focused specifically on some firms or strategies.

Besides the already cited paper by Dawson J.A. "Internationalization of Retailing Operations", another works from the same authors falls in this group, titled "Strategy and Opportunism in European Retail Internationalization", in which expose the retail internationalization process in Europe and focus his attention on the opportunism of the large retailer international activity.

Another very important article in this cluster is the one written by Nicholas Alexander “The Retail Internationalization Process”. This paper develops a very important framework for the retail internationalization process dividing it in two separate terms: market extension and company perspective. By these two different points of view, the author elaborates a matrix that is now very used in internationalization studies (see fig.7); and he additionally state that conceptual frameworks developed in non-retail or non-service environments do not explain the process of retail internationalization.

Figure 6 - Matrix of RI Process; Source: The Retail Internationalization Process by Nicholas Alexander (2000)

In terms of study of RI Process in a specific area or sector, the literature shows a large interest in the European Countries. Additional studies have been conducted for Asian countries (China and Japan); USA and South America. Considering the sector analysed, grocery, fashion and pharma were the industries in which the literature focus its attention the most.

RI Strategy

The second group of articles is represented by the cluster of RI Strategy, which is the largest with 78 papers out 170. When we talk about RI strategy, we focus our attention on documents that study the way international firms operate, via particular case studies or analysing a specific possible strategy attainable by them. However, inside this cluster we find also paper that research drivers and impediments that could influence in several way the internationalization strategy of firms. The most present focuses in this cluster are analysis of strategies connected to entry methods, business models, retail formats, time of entry, market e location analysis, motives of internationalization, standardization versus adaptation, and few others. Overall, we can say that, in respect to the RI Process cluster, this one is more pragmatic and concentrated on the behaviours of firms instead of analysing more at a macro-level the internationalization process. This cluster is particularly interesting for our study on the link between internationalization and innovation. We find that few papers talk about innovation in the internationalization strategies, focusing primarily on online channel and business model innovation.

While e-commerce and online channel research is broad and vary and, even in this particular area of retail internationalization, several papers are focused on this topic, a more interesting approach to the innovation is related to business model innovation, and we find particularly interesting the article of Cao et Al. (2018) in which they aim to identify different patterns of business model innovation which enables international retailers to rebuild their core business logic in new host countries. Focusing their attention to China as the single host country, they compare business model changes of 15 international retailers from various home countries. The findings of the study suggest six routes of retail business model innovations, categorized under three patterns in terms of firms organizational learning capability (exploitation vs. exploration) and resources to which they deploy (home-based vs. host-based). This paper could be an important starting point toward a deeper understanding of the link between retail internationalization strategies and innovation.

RI Performance and RI Success/Failure

The last two clusters, notably RI Performance and RI Success/Failure are similar in terms of when the analysis presented in the papers within the groups have been made. Both of these clusters, in fact, focuses their attention on the analysis of firms after their internationalization process and application of their strategies.

RI Performance cluster contains 23 articles and comprehend the analysis of the economic performance of the internationalization operations. Interesting papers are focused on the study of performance influenced by different factors, such as physical distance (Evans, J. et al., 2000, 2008), speed of internationalization (Mohr, A. et al, 2014, 2017) up to the recent study of the impact of digitalization (Batsakis, G. et al. 2023).

This last paper, interesting also for our innovation focus, examines the relationship between retailer internationalization and performance (I-P relationship), and how this relationship is correlated upon both grocery and non-grocery sectors. In their analysis they found that the I-P relationship is U-shaped, because internationalizing retailers initially incur greater costs in their international expansion owing to their unfamiliarity with foreign markets, but as their foreign presence increases, they benefit from greater market power, experience, and scale economies. Then, they exclaim that as grocers suffer from higher levels of liability of foreignness due to increased requirements for host country embeddedness, non-grocers benefit more from internationalization with any gains and losses further amplified by digitalization.

Moving now into the last cluster of papers, *RI Success/Failure* contains 16 documents and the main difference, if compared with the cluster of *RI Performance*, is that the articles present in this group are less focused on quantitative analysis of retailers' performance, and more interested in studying cases and motives of successful and unsuccessful attempts in internationalization. Particular attention is dedicated to the matter of divestment after failing the internationalization process.

RI and Innovation

Apart from few papers discussed above, the link between RI and innovation is weak and not very well developed. Thanks to this literature review we can say that there exists an important gap in the literature of the possible leading role of innovation in the RI process, and even more importantly, RI strategies.

A retailer can consider different methods of innovation, the most important methods linkable with RI strategies could be related to product and service innovation, store design and layout innovation, technological and supply chain innovation, or even marketing innovation.

The most important paper about the impact of innovation applied into a RI strategy is the article titled "Innovation in retail internationalisation: Tesco in the USA" by Lowe and Wrigley (2009) in which they examine the market entry of the UK's largest retailer (Tesco) into the USA. Tesco's launch of a new brand - Fresh & Easy Neighborhood Markets - is an innovative market entry strategy and this unusual attempt has been examined by the authors in terms of ten 'dimensions of innovation', like some generic dimension such as product innovation, service innovation, accompanied by more specific ones such as innovative locational strategies, and Physical market entry preceded by online entry.

This article and more specifically, this framework given by the ten dimension of innovation could be an interesting starting point for the expansion of this research area.

Research limitations. While striving for a comprehensive analysis, this study acknowledges few limitations, for instance:

- *Scope of Literature Review:* Despite efforts to be exhaustive, limitations in database coverage, search terms, and inclusion criteria may have led to the inadvertent exclusion of relevant articles, potentially biasing the findings.
- *Publication Bias:* Focusing primarily on peer-reviewed journal articles may introduce publication bias, overlooking valuable insights from gray literature, conference papers, and unpublished works.
- *Language Limitation:* Restricting the search to English-language articles may have overlooked significant contributions published in other languages, particularly in regions with active retail internationalization, for example Chinese-speaking countries.
- *Methodological Constraints:* While following established protocols, variations in search strategies, inclusion criteria, and data extraction methods could introduce inconsistencies or biases. Additionally, reliance on citation counts from Scopus may not fully capture article impact.
- *Interpretation Bias:* Despite efforts for objectivity, qualitative analyses may be subject to interpretation bias influenced by researcher subjectivity and preconceptions.

Addressing these limitations requires transparent reporting, robust methodologies, and cautious interpretation. Future research should aim to overcome these constraints for a nuanced understanding of retail internationalization dynamics.

Managerial implications. The findings of this paper offer valuable managerial implications for businesses involved in or contemplating retail internationalization. Managers can utilize insights from thematic clusters (*RI Process*, *RI Strategy*, *RI Performance*, and *RI Success/Failure*) to inform strategic decision-making. Understanding drivers, challenges, and strategies aids in formulating effective market entry and expansion plans.

In addition, analysis of publication trends helps identify promising markets, like the growing attention the Asian region, and determine suitable entry strategies, especially by looking at the *RI Strategy* cluster which can offer insight of existing case studies.

Case of unsuccessful internationalization attempts are present in the *RI success/failure* clusters, so manager can look at the main articles in this group and try to understand the main reasons behind the failures of RI.

Finally, recognizing innovation's role, managers should prioritize its integration into their strategic frameworks. Understanding how innovation enhances competitiveness guides the development of innovative products, services, and business models for international markets, but there is much more to develop in this area.

Originality of the paper. The originality of this paper lies in several key aspects. While previous studies have examined retail internationalization, this paper offers a comprehensive and systematic review spanning three decades. By synthesizing a large body of literature using rigorous methodologies, the paper provides a nuanced understanding of the evolution, trends, and gaps within the field.

In addition, unlike other literature reviews focusing solely on retail internationalization, this paper extends its analysis to explore the relationship between retail internationalization and innovation. By identifying and analyzing trends related

to innovation within the context of retail internationalization, the paper contributes novel insights into an emerging area of research interest. We have found that this link is largely unexplored and further empirical and theoretical research could be needed.

Finally, the paper employs a multi-dimensional analytical approach, combining bibliometric, network, and cluster analyses to uncover patterns, relationships, and clusters within the literature. This holistic approach not only enhances the depth and breadth of the analysis but also provides a more comprehensive understanding of the research landscape.

Appendix

Title	Area
Internationalization of retailing operations	RI Process
The retail internationalisation process	RI Process
Psychic distance: Antecedents, retail strategy implications, and performance outcomes	RI Performance
Failure in international retailing: Research propositions	RI Success/Failure
Lessons learned from unsuccessful internationalization attempts: Examples of multinational retailers in Chile	RI Success/Failure
Brands without boundaries - The internationalisation of the designer retailer's brand	RI Process
Psychic distance and the performance of international retailers: A suggested theoretical framework	RI Performance
Channel power, conflict and conflict resolution in international fashion retailing	RI Strategy
Towards a Taxonomy of International Retail Alliances	RI Strategy
Business model innovation: How the international retailers rebuild their core business logic in a new host country	RI Strategy
Power and control in international retail franchising: Evidence from theory and practice	RI Process
International expansion of retail firms: a theoretical approach for future investigations	RI Process
Retail internationalization and retail failure: Issues from the case of Marks and Spencer	RI Success/Failure
International retail divestment	RI Success/Failure
Retail internationalisation: From formats to implants	RI Strategy
Strategy and Opportunism in European Retail Internationalization	RI Process
A case study on the internationalization process of a 'born-global' fashion retailer	RI Strategy
Business distance and global retailing: A model for analysis of key success/failure factors	RI Success/Failure
SME retailer internationalisation: Case study evidence from British retailers	RI Process
Tchibo Goes Global: Implementing a Hybrid Franchising Strategy at Germany's Leading Coffee Retailer	RI Strategy
An institutional perspective on retail internationalization success: Home depot in chile	RI Success/Failure
Retailers' foreign market entry decisions: An institutional perspective	RI Process
Product and brand. Critical success factors in the internationalisation of a fashion retailer	RI Strategy
International expansion and strategies of discount grocery retailers: The winning models	RI Strategy
The role of management characteristics in the internationalisation of SMEs. Evidence from the UK retail sector	RI Process
Business networks and retail internationalization: A case analysis in the fashion industry	RI Strategy
Explaining international retailers' market entry mode strategy: Internalization theory, agency theory and the importance of information asymmetry	RI Process
Internationalization and Performance of Retail Firms: A Bayesian Dynamic Model	RI Performance
Cultural influence on loyalty tendency and evaluation of retail store attributes: An analysis of Taiwanese and American consumers	RI Strategy
The relevance of retailer country-of-origin to consumer store choice: Evidence from China	RI Strategy
Corporate Branding, Retailing, and Retail Internationalization	RI Strategy
Internationalization Speed and Firm Performance: A Study of the Market-Seeking Expansion of Retail MNEs	RI Performance
An empirical inquiry into international expansion of US retailers	RI Process
The international divestment activities of European grocery retailers	RI Success/Failure
Flagship stores as a market entry method: The perspective of luxury fashion retailing	RI Strategy
International retail franchising: A conceptual framework	RI Process
Internationalization in retailing: Modeling the pattern of foreign market entry	RI Strategy
Explaining the effect of rapid internationalization on horizontal foreign divestment in the retail sector: An extended Penrosean perspective	RI Success/Failure
An exploratory framework for analysing international retail learning	RI Literature Review
International retail divestment activity	RI Success/Failure
An investigation into the initial barriers to internationalization: Evidence from small UK retailers	RI Process

Dynamics of Change: A Comparative Analysis of Commitment in Family vs. Non-Family Businesses

ROBERTA PINNA¹ MICHELA FLORIS² FABIO CORONA³ GIANFRANCO CICOTTO⁴
CINZIA DESSI⁵

Abstract

The challenge of insufficient employee commitment to organizational change significantly impedes management's ability to successfully implement new strategies, a hurdle notably pronounced in family businesses due to a strong adherence to tradition. This study investigates the impact of psychological ownership and effective internal communication-or communication satisfaction-on bolstering commitment to change. This research will suggest propositions to test subsequently with statistical analysis after the collection and analysis of 501 employees' interviews across Italian family and non-family businesses. Our propositions are built on the roots of psychological ownership, and commitment to change. The study also explains how the dynamics between communication, psychological ownership, and commitment vary between family and non-family businesses. This will underscore the critical role of fostering psychological ownership and communication satisfaction in enhancing employee commitment to organizational change initiatives.

Keywords: *Change management, Commitment to change, Communication, Psychological Ownership, family and non-family business*

Framing of the research. *In organizational studies, Moran and Brightman (2001) emphasize the importance of change management for businesses to adapt and thrive amid external pressures. Change management involves rejuvenating an organization's direction, structure, and capabilities to meet stakeholder needs, necessitating updates to procedures, job content, and skills. This adaptability leads to organizational ambidexterity, as described by Tushman and O'Reilly (1996), which is crucial for maintaining stability while promoting innovation. It entails balancing exploitation (optimizing current operations) and exploration (seeking new ideas), enabling companies to manage ongoing operations efficiently while innovating for future success.*

Balancing exploitation, crucial for current success, and exploration, necessary for future sustainability, presents a significant dilemma in change management (Schwarz et al., 2021). This balance is particularly relevant in family enterprises, which represent a significant segment of the global business landscape and are defined by familial ownership, management, and a vision for intergenerational transfer. Despite perceptions of their aversion to change compared to non-family firms (Dessi et al., 2023), family businesses encounter unique challenges, especially during succession, requiring a reevaluation of roles and structures (Dettori and Floris, 2023). Succession is a delicate phase where logical and emotional factors intertwine, significantly impacting business continuity. The challenge of instigating change is underscored by high attrition rates across generations, with only 30% of businesses surviving into the second generation and 10% into the third. Research indicates an innovation gap in family businesses due to their focus on long-term goals and preservation of familial legacy (Casillas & Moreno, 2010; Jell et al., 2015), a trend towards conservatism (Kraiczky et al., 2015; Naldi et al., 2007; Zahra, 2005), and lower adaptability to change (Lubatkin et al., 2007). Failure to implement change can lead to financial losses, decreased market share, and increased costs from cultural disintegration and turnover (Kromah et al., 2024).

There is a consensus in the literature that employee commitment to change is crucial for supporting management innovation; the challenge lies in deciphering the evolution of this commitment over time. This subject's centrality has propelled researchers to investigate the critical factors at both individual (Cunningham, 2006; Herscovitch & Meyer,

2002; Judge et al., 1999; Wanberg & Banas, 2000) and organizational levels (Cunningham et al., 2002) that significantly influence employee behavior towards supporting management innovation.

In this study, we argue that Psychological Ownership (PO) serves as a crucial perspective for understanding how possessive feelings towards objects bolster individuals' commitment to change. Specifically, this research delves into the effects of PO and transparent internal communication (from now on called CS as "communication satisfaction") on commitment to change (CT from now on)⁶.

The interplay between CS, PO, and CT remains underexplored despite extensive examination of communication's role in change processes,

Purpose of the paper. CT is vital in organizational transformations, guiding individuals' adaptation. The absence of commitment often leads to the failure of change initiatives. Recognized for promoting supportive behaviors, CT involves coping strategies to handle change-related stress and uncertainty. Such strategies are critical for maintaining psychological well-being and facilitating effective change navigation, highlighting the significance of commitment in managing organizational change impacts. The construct of CT is articulated as a motivational state (a mindset) binding an individual to a particular course of action deemed essential for the fruitful execution and realization of a change initiative (Herscovitch & Meyer, 2002). This motivational state manifests in three distinct forms (Meyer, Allen, & Smith, 1993): affective commitment (AC from now on), normative commitment (NC from now on), and continuance commitment (CC from now on).

Employees' support for change is influenced by their commitment type, AC, driven by a positive attitude towards change, enhances proactive support and effective coping with stress related to change. In contrast, CC, stemming from a lack of alternatives, can lead to stress and negatively affect the change process. Contextual factors such as organizational tenure, change frequency, previous change experiences, self-efficacy, participation levels, quality of information, and interpersonal relationships significantly impact CT, according to studies by Rafferty & Griffin (2006) and Wanberg & Banas (2000). The relationship between PO and CT introduces a new dimension to understanding organizational change, emphasizing the importance of employees' feelings of ownership over the change process and outcomes (Pierce et al., 2001; 2009; Dawkins et al., 2015).

Employee commitment is pivotal for adapting to and implementing change, with the absence of commitment being a major failure point for change initiatives. This commitment fosters supportive behaviors and coping mechanisms for dealing with the stress of organizational transitions (Cunningham, 2006; Parish et al., 2008). Recent studies suggest that PO, the emotional and proprietary feelings employees have towards their work and organization, contributes significantly to CT, impacting their support for change initiatives. PO functions at individual and collective levels, affecting workplace motivations, attitudes, and behaviors, and is linked to positive organizational outcomes such as job satisfaction, organizational identification, and commitment (Dawkins et al., 2015; Liu et al., 2012; Mayhew et al., 2007; Sieger et al., 2011).

Organizational change introduces uncertainty and stress, which can be mitigated by effective communication. Communication satisfaction enhances PO by deepening employees' connection to their roles and the organization, crucial for reducing resistance and fostering inclusivity during change. Based on these insights, the study hypothesizes a positive relationship between PO and CT (proposition 1). CS is positively related to commitment to change CT (Proposition 2a), and CS is positively related to PO (proposition 2b). This framework underscores the critical role of employee commitment types, PO, and CS in navigating organizational change, suggesting that fostering a sense of ownership and ensuring clear, inclusive communication are key to successful change implementation.

Methodology. This study is still in progress, and we will test our propositions through statistical analysis to investigate the dynamics among PO, CS and CT. Furthermore, we will examine how the nature of the company, whether family-owned or non-family, impacts the intensity of these relationships.

The study involved 501 questionnaires. Within the sample, 63.5% (N = 318) were men and 36.5% (N = 183) were women. They belonged both to family (N = 320, 63.9%) and non-family (N = 181; 36.1%) companies. Sociodemographic data on age were collected and expressed as intervals. Based on this, the 53% of the sample consisted of participants with "18 to 30" and "31 to 40" years old (N = 131, 26.2% and N = 134, 36.8% respectively).

Will be analyze data using IBM SPSS Statistics software, version 25. The initial steps will include exploring socio-demographic characteristics and key research variables. Analysis of Variance (ANOVA) will be utilized to identify any statistically significant variances among the research variables, specifically to factors such as the type of company (family-owned vs. non-family) and participant gender. Additionally, we will investigate linear correlations to determine significant associations between the variables.

The data collection process will employ a separated questionnaire. The initial segment will solicit socio-demographic details from participants, while the latter will be devoted to evaluating key research constructs through three distinct scales. Each scale will be subjected to reliability analysis via Cronbach's alpha to affirm their dependability.

⁶ For easier reading, the legend of acronyms used in this paper is given here:

- PO psychological ownership
- CS Communication satisfaction
- CT commitment to change
- AC affective commitment
- NC normative commitment
- CC continuance commitment

PO: To assess *PO*, a 10-item scale derived from Avey et al.'s (2009) research will be utilized, categorizing items into five key factors of *PO*: Territoriality, Self-efficacy, Accountability, Belongingness, and Self-identity.

CS: This dimension will be measured using a scale adapted from Zwijze-Koning & de Jong (2007) and the *CSQ* (Downs & Hazen, 1977), comprising 24 items across six sub-dimensions that include aspects like superior-subordinate relationships and interdepartmental communications.

CT: Employing a scale developed by Herscovitch and Meyer (2002), this construct will be quantified using 18 items divided evenly among three facets: Affective, Continuance, and Normative commitment to change. Responses will be captured on a 5-point Likert scale ranging from strong disagreement to strong agreement.

Through this methodological approach, the study aims to rigorously evaluate the interplay between *PO*, *CS*, and *CT*, underpinned by a reliable metric assessment.

Results. Our study is ongoing, and we anticipate the following outcomes based on preliminary analyses:

The ANOVA models are expected to reveal significant differences in the average scores of *AC* based on gender and the type of company. We predict that female participants will have higher *AC* scores compared to males, and employees in non-family businesses will show greater *AC* levels than those in family-owned firms.

Moreover, we believe we can find moderate, positive, and statistically significant correlations between *PO* and *AC* and *NC*. Similarly, moderate and positive associations are expected between *CS*, *AC* and *NC*. *CC* is not predicted to show significant correlations with any research variables.

A significant positive relationship between *PO* and *CS* is probable, suggesting that higher levels of *PO* are associated with greater *CS*.

Variations in the impact of *CS* and *PO* on *AC* are estimated by company type. *CS* may not significantly influence *AC* in family-owned businesses, but *PO* is predicted to have a positive impact. We expect an indirect effect of *CS* on *AC* through *PO*, indicating *PO*'s mediation in this relationship. In non-family companies, both *CS* and *PO* are likely to significantly affect *AC*, with a significant indirect effect of *CS* on *AC* through *PO*, suggesting partial mediation by *PO*. The indirect effects are not expected to differ significantly between family and non-family businesses, indicating a consistent mediation role of *PO* across company types.

Regarding the influence on *NC*, both *CS* and *PO* are anticipated to have significant impacts in family-owned companies, with an expected indirect effect of *CS* on *NC* through *PO*, indicating partial mediation by *PO*. While *PO* is predicted to have a significant impact in non-family businesses, *CS*'s effect might not be significant.

These expectations highlight the nuanced roles of *PO* and *CS* in shaping commitment types of *AC* and *NC* within different organizational contexts, emphasizing the potential mediation role of *PO*.

Research limitations. The study's principal constraints are linked to the composition of the firm sample utilized. To enhance the robustness of the proposal, future research could consider diversifying the sample to include both large and small enterprises, assessing the stability of the results across different business sizes or, even, across different countries, which may reveal interesting scenarios. Thus, the study could be extended to incorporate a cultural dimension by distinguishing between various geographical locations, thereby evaluating the cultural influence on the research outcomes. A stimulating avenue for further investigation would involve a deeper analysis of firm categories: focusing solely on family businesses could reveal how the age of the firm and its generational makeup influence the results. In contrast, an examination of non-family firms could explore how leadership styles affect the findings.

Managerial implications. The study's proposal underscores the significant managerial implications of *PO* in facilitating organizational change. It highlights the necessity for companies to cultivate *PO* among employees to mitigate resistance and promote acceptance of change. Specifically, the study advocates for an ambidextrous organizational framework that nurtures attributes conducive to individual initiative, cooperation, multitasking, and autonomy, thereby enhancing *PO*.

This research pinpoints the critical role of managers and employees perceiving change initiatives as personally significant, essentially endorsing the notion of *PO* towards change. The intricate relationship between *PO* and organizational attitudes towards change is influenced by several factors, notably the Sense of Control and Knowledge. Employees experience increased control when their roles offer diversity, significance, autonomy, and identity, resonating with Hackman and Oldham's job characteristics theory. Conversely, bureaucratic structures and centralized information flow can diminish this sense of control and hinder *PO*.

CS emerges as vital in reducing uncertainties and fostering a sense of control, particularly in family businesses where *PO*'s role is profoundly mediating. *CS* is essential, enabling a comprehensive understanding of change objectives, processes, expected outcomes, and individual implications, thereby reinforcing *PO*.

Moreover, it could be interesting to identify which significant dimensions influence *PO*.

In essence, this study would delineate the importance of *PO* in shaping positive organizational change attitudes, suggesting that fostering *PO* through strategic organizational interventions, excellent communication, and inclusive governance can significantly enhance adaptability and manage change resistance. Transitioning towards transformational leadership and facilitating open organizational dialogues are recommended to align employee perspectives with organizational goals effectively.

Originality of the paper. Proposing a departure from existing literature (Cocieru et al., 2019), this study suggests examining the significant influence of *PO* on employees' attitudes toward change and their motivation for contributing to its success.

This research aims to explore the relationships among CS, PO, and CT within the context of family and non-family businesses in Italy, building on and potentially corroborating findings that highlight PO's critical role in enhancing CT aspects (Liu et al., 2012).

Drawing from the groundwork laid by Avey et al. (2009), this investigation seeks to contribute original insights by testing our propositions with the hypothesis that PO significantly and positively influences CT, especially in terms of AC and NC. This relationship is anticipated to be observable across different organizational forms, including both family-owned and non-family enterprises, with an expected stronger impact on NC. The study aims to be pioneering in showing how an intrinsic sense of ownership not only bolsters the perceived obligation towards change but also acts as a catalyst for organizational transformation.

Expanding on the seminal work of scholars such as Armenakis & Bedeian (1999), Beer & Nohria (2000), and Herscovitch & Meyer (2002), this research proposes to shed new light on the positive effects of CS on CT. It intends to uniquely demonstrate a significant, positive correlation between CS and the dimensions of AC and NC, with subsequent analyses exploring CS's critical role in shaping these types of commitment.

The study plans to highlight the transformative potential of well-communicated change, emphasizing the importance of a clear communication of change processes to employees to alleviate concerns and foster a culture ready for change. It aims to innovatively link effective communication during transitions to outcomes such as increased acceptance of change, reduced anxiety, and enhanced trust in leadership, offering a fresh perspective on change management discussions.

Additionally, this research has the potential to reveal a significant link between CS and PO, suggesting a meaningful interaction between these constructs rather than their independence. It proposes to investigate PO's mediating role in enhancing the relationship between CS and CT, particularly affecting AC and NC. The study will examine how transparent communication about change, coupled with a strong sense of ownership among employees over their work, optimally impacts their commitment to change, suggesting a nuanced interplay between communication, ownership, and commitment in the context of organizational change.

Exploring the dynamics of external knowledge acquisition in family businesses: factors, constraints, and success indicators

ALESSIA SCIARRONE¹ GERARDO BOSCO² RAFFAELE D'AMORE³
DAVIDE LIBERATO LO CONTE⁴ MARIO CALABRESE⁵

Abstract

This research delves into the dynamics influencing family businesses' engagement with external knowledge, aiming to shed light on the motivations, challenges, and benefits associated with seeking knowledge beyond organizational boundaries. Drawing on a single case study methodology, we provide a detailed framework that offers insights into the factors driving family entrepreneurs to explore external knowledge sources. Additionally, we uncover the primary constraints and challenges faced by family businesses in accessing and leveraging external knowledge, offering actionable insights for overcoming these hurdles. Our findings suggest that addressing these challenges head-on can enhance family firms' capacity for innovation, adaptation, and success in dynamic market environments. Furthermore, we identify specific indicators that highlight the tangible benefits derived from family businesses' interactions with external knowledge sources, emphasizing the significance of cultivating collaboration networks beyond the confines of the family firm. Overall, this study contributes to the existing literature by offering a nuanced understanding of the intricate relationship between family businesses and external knowledge, with implications for both scholarly research and managerial practice.

Key words: *Family Business; Familiness; Knowledge Management; Absorptive Capacity; Exploration; Dynamic Capabilities*

Framing of the research. *Organizational knowledge is widely recognized as a critical factor for a company's competitive advantage (Andersén, 2015), becomes even more crucial in rapidly evolving environments. In such contexts, firms can leverage organizational configurations where competitive advantage stems from the synergy between resources and competencies (Piciocchi et al., 2009). The capability to assimilate external knowledge from the business environment serves as an efficient means of swiftly acquiring new competencies (Grant, 1996; Kogut & Zander, 1992). Within this framework, the entrepreneurial mindset embraced by family decision-makers holds significant sway. They must embody an entrepreneurial inclination both at the individual and organizational levels (Oliveira & Dias, 2017). This is because family members in leadership roles face a twofold challenge: on one front, they must navigate family dynamics and business imperatives to ensure the enduring prosperity of the enterprise; simultaneously, they must possess the acumen to innovate and adapt swiftly to evolving market conditions. This necessitates a continual renewal of their skills and their integration into the company's operations, thereby enabling it to operate with enhanced agility vis-à-vis its competitors (Cohen & Levinthal, 1990). This extends past structural confines, viewing environmental dynamism as an avenue for opportunity rather than mere complexity (Saviano & Caputo, 2013).*

The company's capacity to integrate, renew, reconfigure, and transform both internal and external resources is encapsulated by the term "dynamic capabilities" (Teece, 2007; Zahra & George, 2002; Zahra et al., 2006; Eisenhardt & Martin, 2000; Teece et al., 1997). The company's ability to "identify, assimilate, and leverage knowledge from the environment" (Cohen & Levinthal, 1990) is defined as absorptive capacity (AC). This dynamic capability empowers the organization to create value by fostering innovative advantages while concurrently mitigating the impact of existing ones (Lepak et al., 2007). According to Pütz and Werner (2023), AC assumes a pivotal role for small and medium-sized enterprises (SMEs), serving as a critical tool for crafting survival strategies and effectively navigating the complexities of globalization. Zahra and George (2002) propose that the creation of competitive advantage through absorptive

capacity comprises two key components: potential absorptive capacity and realized absorptive capacity. This process begins with the ability of "acquisition," which signifies the company's adeptness at identifying and procuring pertinent external knowledge (potential absorptive capacity). Subsequently, the process advances to the stage of "assimilation," involving the requisite processes and routines to analyze, interpret, and comprehend the newfound knowledge (potential absorptive capacity). Moving forward, the phase of "transformation" necessitates the development and enhancement of procedures to seamlessly integrate the novel external knowledge with the existing repertoire (realized absorptive capacity). Ultimately, the "exploitation" of acquired knowledge becomes pivotal in assimilating it into current operational processes, with the aim of yielding tangible business results (realized absorptive capacity).

In the academic literature on absorptive capacity within family businesses, various factors have been investigated that can positively or negatively influence the firm's ability to identify, acquire, transform, and exploit knowledge from external sources. Among these factors are the influence of the family (Brinkerink, 2018; Chirico & Salvato, 2008; Daspit et al., 2019) and the role of non-family members (Belkhouja & Daghfous, 2021; Cunningham et al., 2016; Daspit et al., 2019), entrepreneurial orientation (Chaudhary & Batra, 2018; Hernandez-Perlines, 2018; Santos et al., 2021), and the level of technological competence (Chaudhary & Batra, 2018).

A more nuanced examination has been directed towards the structure of family social capital (Pearson et al., 2008), underscoring how robust social capital can positively influence the firm's capacity to amalgamate and integrate external resources with internal ones (Andersén, 2015; Belkhouja & Daghfous, 2021; Daspit et al., 2019; Pütz et al., 2023; Zahra & George, 2002). The notion of family social capital is intrinsically linked to the concept of familiness. Following Pearson et al.'s framework (2008), familiness is delineated as the culmination of the unique interplay among the three core dimensions of social capital (structural, cognitive, and relational). Put simply, familiness emerges from the interpersonal connections and bonds among family members (structural dimension), shared perceptions, interpretations, and systems of understanding (cognitive dimension), and resources fostered through personal relationships, including trust, norms, obligations, and identity (relational dimension). Consequently, as social capital resources among family members expand, those interconnected are better equipped to effortlessly share and combine knowledge, accessing internal information more efficiently (Daspit et al., 2019). Moreover, when social capital is robust, it encourages heightened cooperation and solidarity among family members themselves, fostering enhanced internal cohesion and mutual support (Daspit et al., 2019). Conversely, it has been observed that the same familiness may detrimentally affect the firm's capacity to identify external knowledge (Andersén, 2015; Daspit et al., 2019; Pütz et al., 2023; Zahra & George, 2002).

From this perspective, while high social capital facilitates significant internal knowledge sharing, it may also cultivate a closed mindset. This occurs because familial bonds can create resistance to seeking and embracing external ideas or knowledge. Consequently, familiness can be both a strength and a weakness for a company (Andersén, 2015). Companies with a high level of familiness may encounter difficulties in identifying and comprehending knowledge from external sources, potentially delaying the identification and adoption of new technologies compared to those with weaker familiness (Arregle et al., 2007; Carney, 2005; Daspit et al., 2019; König et al., 2013). Employing March's terminology (1991), familiness is likely positively associated with exploitation capability but inversely correlated with exploration capability (Andersén, 2015). However, assessing familiness as a positive or negative factor depends on the specifics of the industry and the business environment. In stable contexts, prioritizing internal efficiency is crucial, whereas in more unstable environments, continuous acquisition and integration of new knowledge become essential for the company's success (Zahra & George, 2002).

To fully understand familiness and identify the numerous factors influencing the knowledge management capabilities of family businesses, it's essential to expand the scope beyond just family social capital. As Sharma (2008) suggests, by integrating the research of Pearson et al. (2008) and Arregle et al. (2007), the close interconnectedness between family and business systems opens up avenues for potential appropriability that go beyond social capital flows to include other forms of capital. In this context, it's crucial to consider not only social capital but also human capital, which encompasses the knowledge, technical expertise, emotional resilience, and intellectual capital of both family and non-family members (Puhakka, 2002); financial capital, especially in terms of long-term investments; and physical capital, which includes the company's infrastructure, equipment, and tangible assets (Sirmon & Hitt, 2003). Embracing this perspective, familiness can be defined as the integration of social, human, financial, and physical capital resources within a firm, resulting from interactions between the family and business systems (Habbershon & Williams, 1999; Habbershon et al., 2003). To understand changes in familiness, it's crucial to monitor how resources available to the family and business systems evolve in response to the flow of capital between the two systems (Sharma, 2008).

According to Jansen et al. (2005) and Andersén (2015), in family businesses, their inherent tendency to be less externally oriented may lead firms with high levels of familiness to have a diminished capacity to identify and comprehend external knowledge (potential absorptive capacity). However, once assimilated, familiness could enhance the effective utilization of such knowledge (realized absorptive capacity) through specific mechanisms of social integration within the family and the presence of strong family social capital (Pütz & Werner, 2023).

Considering that potential absorptive capacity (AC) and realized absorptive capacity operate sequentially and directly influence innovation processes in family businesses (Aloulou, 2024; Ali & Park, 2016; Cepeda-Carrion et al., 2023; Chaudhary et al., 2021), these companies should maintain an open mindset and consistently update their knowledge, aligning it with emerging market trends and technologies. This is essential to prevent their knowledge base from becoming outdated and to ensure it can be effectively and profitably leveraged (Andersén, 2015; Filippini et al., 2012; Wang, 2016). Therefore, the proper implementation of AC enables family businesses to adapt promptly and flexibly to changing environmental conditions, such as shifts in industry structures, the introduction of new technologies, and

corporate crises (Boyd & Hollensen, 2012; Eisenhardt & Martin, 2000; Zahra & George, 2002). Scholars should consider the holistic effects of AC, particularly regarding the interplay between potential and realized AC, as it represents a crucial resource for companies in addressing challenges posed by continually evolving environmental changes (Eisenhardt & Martin, 2000; Pütz & Werner, 2023). Underexplored are the factors influencing the willingness and motivation of family entrepreneurs to seek external knowledge, even within environments rich in familiness. Kotler et al. (2020), aligning with existing literature, argue that the emotional attachment of family owners to the business often leads them to undervalue the significance of external knowledge, thereby diminishing the firm's inclination to acquire and integrate new knowledge beyond its established realms.

The emerging insights underscore the critical importance of comprehending the cognitive processes guiding decision-makers' actions. Despite the evolving landscape, decision-makers often adhere to traditional patterns, criteria, and techniques rooted in an outdated perception of linearity within entrepreneurial systems (Calabrese, 2014), particularly evident in contexts marked by strong value categories (e.g., business families with a pronounced sense of familiness). This highlights the imperative for an interpretative framework to aid decision-makers in navigating complex contexts, facilitating the interpretation of phenomena and variables inherent to such environments, thus enhancing the decision-making process (Barile, 2008; Calabrese et al., 2024).

Purpose of the paper. The aim of this research is to deepen the understanding of the dynamics influencing the capability of family businesses to identify and acquire external knowledge. Family businesses, often characterized by a common language and shared experiences (Katz & Kahn, 1978), may tend to favor the use of their internal resources for knowledge management (Daspit et al., 2019; Pearson et al., 2008). However, there are circumstances in which these businesses turn to external sources to acquire new knowledge. These activation triggers can be manifold, including corporate crises, new corporate strategies, rapidly evolving environmental conditions, technological changes, or competitive pressures (Duchek, 2013; Zahra & George, 2002).

Academic research on family businesses and absorptive capacity suggests a strong link between the characteristics of family ownership and the use of external knowledge; however, there is still little clarity on the socio-emotional mechanisms driving this effect (Kotlar, 2020; Pütz & Werner, 2023). During the perception process, the acceptance or rejection of new information is influenced by value categories, which determine the extent of variation in the diversity of knowledge possessed as a result of information reception (Barile & Calabrese, 2011).

The goal is therefore to identify the factors that drive family entrepreneurs to seek knowledge beyond company boundaries. This approach aims to understand the crucial role of the family entrepreneur in directing the company outward and fostering openness to new sources of knowledge.

QR1 = What are the factors driving family entrepreneurs to seek knowledge beyond company boundaries, and how do they influence the company's outward orientation?

Furthermore, the aim is to investigate the constraints and challenges encountered by family entrepreneurs in their attempt to access external knowledge. Among these factors are, for example, safeguarding independence from external agents (Donkels & Fröhlich, 1991) and preserving the socio-emotional heritage of the organization (Gomez-Mejia et al., 2007). Understanding such obstacles and difficulties is crucial for formulating effective strategies that enable family entrepreneurs to overcome them and fully leverage the opportunities offered by external knowledge.

QR2 = What are the main constraints and challenges that family entrepreneurs face in the process of exploring external knowledge?

Lastly, it is common for senior family members and older employees to hinder the use of knowledge, displaying distrust towards changes and little interest in new knowledge (Eniola, 2023). Consequently, it becomes essential to identify specific indicators that highlight the benefits of interacting with external knowledge sources. These indicators not only provide a tangible measure of the effectiveness of external knowledge acquisition strategies but also help overcome the family entrepreneur's resistance to external openness, offering concrete evidence of the importance and advantages of engaging with external knowledge sources for the long-term success of the family business, thus facilitating the creation of solid and advantageous collaboration networks for the company.

QR3 = What are the specific indicators that can highlight the benefits derived from the interaction of family businesses with external knowledge sources?

Methodology. Addressing the research gaps identified in the context of decision-making processes within family-run businesses, often influenced by specific cultural models and values, this study aims to propose hypotheses to fill these gaps. The objective is to correlate the effective contributions of process and knowledge management with company performance metrics, such as economic-financial sustainability and operational efficiency. To achieve this goal, the study focuses on a specific case of a company (single case research), intending to investigate a practitioner enterprise and the dynamics it experiences in managing "familiness" and its impact on governance and management methods. The core of the analysis is focused on the factors guiding the transition from adopting family procedures (first-level change) to integrating external knowledge (second-level change). This study holds crucial importance in fully understanding the complexity of this transition, which marks a critical shift from maintaining established practices to the ability to assimilate new knowledge. In other words, the investigation explores how the company under study, first and foremost, recognized the need to open up to external sources, and secondly, utilized external knowledge to increase efficiency and improve performance through the implementation of process and knowledge management techniques, while mitigating potential constraints associated with the familial nature of entrepreneurship.

External knowledge refers to the various knowledge beyond the expertises and traditional practices of the family entrepreneur. Considering this focus, the external knowledge are connected both external professionals and specialized employees, in order to their contribution to improve the overall knowledge of the company, generating, by this way, the conditions to improve performances.

The methodology is structured into several phases:

- *Case study selection:* A representative company undergoing generational transition and demonstrating interest in implementing new management techniques to enhance its performance has been chosen.
- *Data collection:* Information is gathered through interviews with the CEO and functional managers, focusing on the role of external knowledge in implementing process and knowledge management techniques.
- *Data analysis:* The collected information will be analyzed to understand the governance and management methods used by the company, the level of formalization of the organizational structure, and the economic-financial and operational performance indicators. Additionally, the analysis will include examination of the generational transition, process explicitation, and implementation of knowledge management strategies.
- *Performance evaluation:* Performance indicators will be identified and examined before and after the implementation of the new process and knowledge management techniques to assess their overall impact on the company.
- *External context:* External factors such as economic and regulatory context that could influence company performance will be taken into account, ensuring a comprehensive and accurate evaluation.

Through this methodology, our objective is to underscore the significance of external knowledge acquisition in deploying process and knowledge management methodologies within the familial business milieu. The ultimate objective is to elucidate how the transition from tacit to explicit knowledge, facilitated by external knowledge utilization, may enhance the overall performance of the company within the framework of familiness.

Results. The anticipated outcomes of this ongoing research endeavor aim to significantly contribute to the existing literature on family businesses and their engagement with external knowledge, particularly in the realm of absorptive capacity. By offering a comprehensive framework of the dynamics shaping family firms' absorptive capacity, this study adds depth to our understanding of how these organizations navigate the knowledge landscape. Specifically, the identification of key drivers propelling family entrepreneurs to seek knowledge beyond their organizational boundaries provides novel insights into the motivations behind knowledge acquisition strategies in family businesses. Understanding these drivers can help shed light on the strategic decisions made by family firms regarding their engagement with external sources of knowledge. Moreover, by uncovering the primary constraints and challenges faced by family entrepreneurs in accessing and exploring external knowledge, this research offers actionable insights for overcoming these hurdles, thereby enhancing family firms' capacity for innovation, adaptation, and success in dynamic market environments. This nuanced understanding not only enriches theoretical perspectives on absorptive capacity but also provides practical implications for family business practitioners seeking to leverage external knowledge effectively.

Research limitations. Using a single case study as a research method presents some intrinsic limitations that need to be considered. Firstly, the generalizability of the results could be compromised since the data and conclusions are based on a single organization. This means that the findings may not be representative of other family businesses with different contexts and characteristics. Additionally, the risk of subjective interpretation is increased as the results largely depend on the researcher's interpretation and analysis. Moreover, the lack of diversity in the sample may limit the variety of perspectives and experiences considered in the case study. Lastly, since a single case study provides a limited overview of a single business reality, there could be other unidentified or unconsidered influential variables or factors that may affect the results in unforeseen ways.

Managerial implications. This research contributes valuable practical insights by shedding light on the primary constraints and challenges encountered by family entrepreneurs as they navigate the realm of accessing and leveraging external knowledge. The examination of the factors motivating entrepreneurs to pursue external knowledge (QR1) facilitates the refinement of models that are more precise and anticipatory in nature. Furthermore, this study delves into the socio-emotional mechanisms guiding firms as they transition from reliance on familial routines (representing a first-level change) to embracing external knowledge (representing a second-level change), thus furnishing practical insights directly applicable to family entrepreneurs. Such an approach enables the formulation of tailored strategies that foster consonance among the family system, the business framework, and the external milieu.

Through a meticulous identification and analysis of the principal constraints and hurdles confronted by family entrepreneurs in their quest for external knowledge exploration (QR2), pragmatic recommendations can be derived to surmount these challenges and enhance the efficacy of endeavors aimed at acquiring external knowledge within family enterprises. Additionally, the discernment of specific indicators elucidating the benefits derived from family businesses' engagements with external knowledge sources (QR3) not only serves to substantiate the tangible advantages accrued from such interactions but also underscores the significance of nurturing collaborative networks that transcend the confines of the familial enterprise. This equips family entrepreneurs with a demonstrative instrument emphasizing the imperative of adopting an open and innovative approach to managing external knowledge.

By directly confronting these challenges, family businesses can bolster their capacity for innovation, adaptation, and prosperity within dynamic market environments, thereby attenuating resistance to change that may manifest within the organization, particularly amidst the backdrop of familial dynamics and traditions. These findings furnish practical guidance for business decision-makers and constitute a notable contribution to the scholarly discourse, furnishing a more comprehensive perspective that encompasses both the cognitive processes of business decision-makers and the interplay between the firm and its suprasystems.

Originality of the paper. *The originality of this paper lies in its comprehensive exploration of the dynamics influencing family businesses' engagement with external knowledge. While previous studies have touched upon aspects of absorptive capacity and knowledge management in family firms, this research offers a deeper examination of the motivations, challenges, and benefits associated with seeking knowledge outside organizational boundaries. By integrating theoretical perspectives with empirical evidence from a single case study, this study provides a nuanced understanding of how family entrepreneurs navigate the knowledge landscape and the implications for firm performance and long-term success. Furthermore, the identification of specific indicators highlighting the benefits of external knowledge interactions adds novel insights to the literature, contributing to a more holistic understanding of the role of external knowledge in family business strategies. Overall, the paper's originality lies in its comprehensive approach to exploring the complexities of family businesses' engagement with external knowledge and its implications for organizational success.*

Tradition in Transition: Exploring Organizational Dynamics and Strategies in Small Hotels

MARCO CORSINO¹ DAVIDE BAGNARESI² FRANCESCO MARIA BARBINI³

Abstract

In the evolving hospitality industry, small hotels confront challenges amidst digitalization, sustainability, and shifting tourist behaviors. This paper examines organizational dynamics in Bellaria - Igea Marina, an Italian seaside destination. Employing historical insights and organizational analysis, it explores strategies used by small hotels. A survey of 140 managers, complemented by interviews, reveals a blend of tradition and innovation. Family ownership, local entrepreneurship, and strategic adaptation are prominent. Despite hurdles like generational transitions, small hotels exhibit resilience, offering insights for sustained competitiveness. This study contributes to hospitality management literature, illuminating the interplay between tradition and innovation and proposing strategies for addressing organizational challenges.

Key words: Hospitality industry, small hotels, organizational dynamics, local entrepreneurship, strategic adaptation.

Framing of the research. *The competitive environment of the hospitality industry is impacted by profound social, economic, and technological transformations, suffice it to mention in particular:*

- *Digitization: the increasing use of digital technology affects how hotels handle reservations, manage performance, promote their services, and interact with customers.*
- *Sustainability: there is a growing focus on sustainability (declined in its environmental, social, and economic dimensions), with many hotels adopting eco-friendly practices to meet customer expectations.*
- *Changes in tourist behavior: tourists are increasingly seeking customized and unique experiences; they want to be involved in designing the services they will use.*
- *Changes in business models: the development of the sharing economy is changing the competitive dynamics of the hospitality industry with the emergence of competition from services such as Airbnb.*
- *Socio-demographic changes: tourists' preferences are changing with social and demographic changes, for example, with the increase in the number of trips and the simultaneous reduction in their duration.*

In this situation, there is an increasingly pressing need for hotels to innovate. This innovation is not limited to services rendered but extends to organizational configurations, labor division choices, and people selection and management processes (Baum, 2006; 2015; Chiang, 2010; Gomezelj, 2016; Martín-Rios, Ciobanu, 2019; Shin, Perdue, 2022).

If large hotels and international chains ride and direct innovation processes, the reaction of smaller hotels is more complex to decrypt: the poor managerial skills of executives, the anchoring to traditions, and the constraints imposed by the limited resources available seem to preclude their ability to adapt and ultimately survive (Morrison, 2002; Morrison, Conway, 2007).

On the other hand, although the fate of small hotels seems sealed, they still are the backbone of most hospitality systems, particularly in Europe (Lee-Ross, Lashley, 2010); also, most of them are family-owned and usually are run directly by the owner or his/her family (Getz et al. 2004), thus contributing to the economic development of local communities.

It also seems evident how, beyond hypothetical best practices related to the implementation of innovations, different organizational solutions and management methods still coexist and succeed simultaneously. Tradition and innovation in hotel management do not seem to be opposite poles of a continuum of organizational solutions but intersect and allow a wide range of choices and trajectories of change (Bagnaresi et al., 2021).

Purpose of the paper. *This paper investigates the dynamics of organizational change in small hotels, focusing on the City of Bellaria - Igea Marina. In a context in which the hospitality industry is exposed to multiple pressures, including*

digitization, sustainability, changing tourist behaviors, and new business models, the paper aims to understand how small-sized hotels address these challenges.

Through an interdisciplinary approach combining historical and organizational methods (Bagnaresi et al., 2018; Decker et al., 2015; Kieser, 1994; Kipping, Üsdiken, 2014; Maggi, 2003), the full paper will provide an overview of current organizational choices and will outline evolutionary trajectories for small hotels in Bellaria - Igea Marina, thus contributing to the literature on hospitality management and to local planning policies.

Methodology. Situated along the Adriatic coast, the Municipality of Bellaria - Igea Marina is located in the southeastern part of the Emilia-Romagna Region. Today, the city has a population of 19,408 and is among the best-known national seaside tourism destinations. The tourism sector is the driving force of the local economy. This is made possible thanks to the unmatched presence of hotels in the area. Along its city coastline, which stretches for about 7 kilometers, there are currently 299 hotels (Istat, 2023) with almost 20,000 beds. This is also confirmed by the Annual report on tourism and hotel accommodations periodically compiled by the Region. In it, 2,053,300 overnight stays are recorded for the year 2023: a value that is up from the last two years (1,780,397 in 2021) and that is close to that surveyed before the COVID-19 (2,216,032 in 2019). The 2023 data confirm how Bellaria - Igea Marina emerges as the third destination in the province after Rimini (6,540,397) and Riccione (3,279,881) and how the same position is demonstrated in terms of the number of arrivals: 384,674 compared to Rimini's 1,751,391 and Riccione's 833,637. When compared with the population density and the area of the territory (18.17 km) of the Municipality of Bellaria-Igea Marina, the numbers reported appear even more impressive.

Such a positioning is the result of a centuries-old history and legacy. The city's tourism growth and the evolution of its hospitality industry developed in parallel with the other seaside resorts of the Riviera Romagnola (Battilani, Fauri, 2009). Before the development of this industry, the local economic vocation was, for centuries, agriculture and fishing. With the arrival of the first vacationers in the nearby city of Rimini, Bellaria - Igea Marina also began to gear up for hospitality. Fostering the birth of a primordial tourism industry is the 1885 inauguration of the railway station (which made the city accessible) and the subsequent development of the first urban master plan. The first private villas sprang up along the shoreline, and in 1913, the first hotel was opened. Ten years later, a travel guide listed four more guesthouses (Becca, 1923). They all promoted themselves for their "affordable prices" and for being ideal "for families".

This approach (based on family management, the provision of essential services, and low prices) would characterize the basis of the success of the entire Romagna coastline when the late 1950s and early 1960s saw the explosion of mass tourism in Italy. In the case of Bellaria - Igea Marina, it is sufficient to highlight the number of hotels surveyed by the Internal Statistical Yearbook of Commerce and Tourism for 1963 (347) and how it gradually increased until it reached 450 in 1974. Censuses conducted at the time testify how these hotels were solely seasonal and, in the vast majority, small (more than two-thirds were listed as Category III - boarding houses). Not unlike neighboring tourism destinations, an important phenomenon that comes into being is that of tourist loyalty. A survey conducted by the Region in 1978 indicates that 67.4 percent of the tourists interviewed had already stayed in Bellaria - Igea Marina in the past and that the two most appreciated features were the low prices (25.7 percent) and the friendliness of the residents (23.9 percent).

A change in the structure of the hospitality industry emerged between the 1980s and 1990s. It was due to several factors, such as competition with new domestic and international destinations and generational change.

The change has involved the renovation of buildings, focusing on specific target customers (mainly families with children), and developing specific high-value-added services for the identified target. These interventions have allowed Bellaria-Igea Marina to consolidate its competitive position and demonstrate high resilience to the formidable challenges posed by COVID-19.

In 2020, the Municipality of Bellaria - Igea Marina established the BIM2040 Strategic Plan, i.e., a participatory and open local planning initiative to define the city's identity for 2040.

BIM2040 works on several fundamental and interconnected dimensions: education, culture, sustainability, urban planning, social progress and inclusion, and economic development. Local institutions, research and educational institutions (in particular, the Center for Advanced Studies in Tourism of the University of Bologna), local economic categories, and residents contribute to the Strategic Plan.

In the context of the meetings and events held in 2021 on the topic of the local economy and its prospects, the understanding of the characteristics and dynamics of the hospitality industry, the main driver of the city's economic fabric, gained particular importance.

It was therefore decided to deepen the investigation on this topic and, during 2022, several meetings were held to understand what, according to tourism entrepreneurs and residents, were the main strengths, critical issues and opportunities of the local hospitality industry.

At the end of 2022, a focus group was established to prepare a questionnaire investigating the organizational and managerial characteristics of hotels in Bellaria - Igea Marina. It has been composed of experts from the BIM204 management team, the Municipality of Bellaria - Igea Marina, researchers from the Center for Advanced Studies in Tourism of the University of Bologna, and representatives of the leading local hotel manager associations (Federalberghi and Confcommercio).

The focus group prepared, tested, and validated a survey based on an online questionnaire to be submitted to all hotel managers in Bellaria - Igea Marina.

The questionnaire consisted of thirty-two closed-ended questions organized into four sections:

1. The hotel (name, foundation year, category, size, seasonality, ownership structure, legal form);
2. The hotel manager (age, place of birth, education, professional experience, family);

3. *The organizational and managerial choices (competitive strategy, target customers, decision-making processes, division of labor, authority and hierarchy, human resource management);*
4. *The future (generational transition, hotel prospects in the medium and long term).*

The link to the questionnaire was sent, along with a cover letter, by BIM2040 to the managers of the 299 hotels on February 28, 2023. The survey was closed in early April 2023.

A total of 140 valid questionnaires were filled out. The response rate was very high (47 percent of the population) and reflects the demographics of local hotels. The survey results were presented and discussed in the focus group and presented in several meetings to the heads of local hotelier trade associations. These meetings enabled a richer interpretation of the emerging evidence and the identification of some critical elements.

In December 2023, a public event was organized to expose relevant findings and issues to local hotel managers and policymakers. The event was attended by about 100 people, including the mayor and city council, business owners, residents, and about 70 hotel managers. At the end of the presentation, a participatory analysis of the results and an open discussion aimed at gathering feedback and alternative interpretations was initiated. The discussion highlighted the most critical issues, with particular reference to the sustainability of the industrial structure over time, generational transition in hotel management, and the possible tension between tradition and innovation.

Based on these insights, ten hotel managers were selected from the 140 respondents and invited for in-depth interviews (the interviewees have been selected to reflect different hotel categories and sizes and different generations of managers).

The semi-structured interviews are focused on the history of the hotel and the family, with particular emphasis on the issues of generational shift and organizational change. The ten interviews, which are currently being conducted, will be transcribed and analyzed through a thematic analysis (Guest et al., 2012).

Results. *Below, we present the main findings emerging from the survey. In the full paper, these results will be integrated and supplemented by the results of the interviews. The data emerging from the survey show peculiar characteristics.*

The average hotel size is 17 rooms for one-star hotels, 21.6 rooms for two-star hotels, 41.1 rooms for three-star hotels, and 48 rooms for four-star hotels. 99% of the hotels are open only in summer.

Regarding ownership structure, 94% of the hotels are owned by the manager (who therefore qualifies as owner-manager). In addition, 24% of respondents own more than one hotel.

The first hotels were founded in the period between the two world wars (12 hotels established between the 1920s and 1940s). After World War II, most hotels were founded (42 in the period 1950-1959, 58 in the period 1960-1969). In the following ten years (1970-1979), 22 hotels were founded. Only one hotel was founded between 1990 and 2023.

Interestingly, 10 of the 12 hotels founded before World War II are still run by the same founding families (with several generational transitions occurring over time). More dynamism concerned the management of hotels founded in the 20 years after World War II: only 58 out of 110 are still run by the founding families. The change in the management structure of these hotels was one element of dynamism that marks the 1980-2023 period.

As for hotel managers, most of them (96 out of 140) were born in the period 1960-1969 (48) or in the period 1970-1979 (48). 24 hoteliers were born before 1960, and only 20 after 1980.

33 hotel managers have been running the hotel for over 30 years, 49 for less than 15 years.

21% of hoteliers have a laurea degree, 71% have a high school degree.

Interestingly, 85% of hotel managers were born around Bellaria - Igea Marina. This percentage reaches 90% when considering those born in the Emilia-Romagna region. It is, therefore, an extremely local entrepreneurship, immersed in the city's identity, embedded in deep and long-lasting social networks. Moreover, in 94 percent of the hotels, at least one member of the manager's family is involved in hotel management.

Regarding strategic choices, 49% of hoteliers believe that customers choose their hotel because they are fond of them or their family, 36% believe that customers are mainly attracted by the high quality of services offered at the hotel. Finally, 15% believe that customers are primarily attracted by the low prices charged at the hotel.

These responses tend to be consistent with the competitive strategies stated by managers: 74% of them say they pursue a strategy of innovation and differentiation, while 16% pursue cost leadership.

Concerning decision-making processes, 37% of managers say they make decisions analytically, including using advanced management systems; 34% say they rely on their experience, and 29% make decisions by following market trends. Ultimately, most managers make decisions based on only minimally objective perceptions, assumptions, and trends.

As for people management styles, 74% direct people by imposing standardized rules and procedures, 14% by continuously issuing directives and orders, and only 13% say they stimulate employees to make decisions and exercise discretion. In 47% of the hotels, employees work exclusively within one Service; in 4% of the hotels, employees rotate continuously between departments; finally, in 49% of the hotels, employees are framed in one Service and occasionally are seconded to other departments.

Recruitment of new employees is mainly done directly and individually; references and suggestions from current employees are also important. Marginal is the use of agencies, trade associations, and training institutions. As for the skills sought in employees, 51 percent of managers say they are mainly looking for experience and skills, 23 percent are looking for hard-working people, and 16 percent are looking for employees with character predispositions.

Finally, about the future of family management, 79% of hotel managers say they would like to pass management to their descendants, while 21% would not want to do so at all. 59% of respondents realistically (beyond their wishes) believe that after themselves, management will pass to their descendants, 21% plan to sell the hotel, 11% plan to rent it out, 6% plan to separate ownership and management, and 2% plan to close the hotel.

Research limitations. The results of this investigation are based on a single tourism destination, they are indeed in need of additional comparisons. Finally, longitudinal analysis relying on a sample surveyed in different moments of time would be very important to improve our understanding of dynamic processes.

Managerial implications. Results from the survey and interviews will be used to identify the management and organizational type each hotel tends to. Indeed, beyond any difference in size and category, hotels tending toward the same ideal type show similar approaches to the business and adopt similar organizational solutions (Bagnaresi et al., 2018). The information from the interviews will also allow the trajectories of change among the various types of hotels to be represented. In this way, in the full paper we will be able to propose answers to the most critical issues and organizational challenges that characterize small hotels in Bellaria - Igea Marina, specifically:

- The current structure of the hotel industry has ensured the success of the city for sixty years. Can it continue to sustain its competitiveness for the next twenty years?
- The continuity in the management of more than a quarter of hotels appears to be at risk. Does the entry of “alien” management represent an opportunity or a threat?
- Can tradition and innovation coexist in hotel management?
- How to foster generational transition in hotel management?

Originality of the paper. This paper contributes to the literature on hospitality management by offering a nuanced exploration of the organizational dynamics within small hotels, particularly in the context of Bellaria - Igea Marina. Unlike previous studies that often dichotomize tradition and innovation as opposing forces, this research unveils their symbiotic relationship within small hotel operations. By delving into the historical evolution of hospitality in the region and examining contemporary managerial practices, this study uncovers how small hotels effectively blend tradition with innovative strategies to navigate the multifaceted challenges of the modern hospitality landscape. This integrative approach sheds light on the unique organizational configurations, management styles, and strategic orientations prevalent among small hotels, providing fresh insights into their adaptive capacity and resilience in the face of dynamic market forces.

Furthermore, this paper offers a methodological contribution through its interdisciplinary approach, combining historical analysis with organizational methods to provide a comprehensive understanding of small hotel dynamics. By triangulating survey data with in-depth interviews, the study captures a rich tapestry of managerial practices, strategic choices, and organizational structures within the hospitality sector of Bellaria - Igea Marina. This holistic methodological framework not only enriches our understanding of small hotel management but also serves as a model for future research endeavors seeking to unravel the complex interplay between tradition, innovation, and organizational change in other tourism destinations. Through its original approach and empirical insights, this paper advances scholarly discourse on hospitality management and offers practical implications for policymakers, industry stakeholders, and local communities striving to foster sustainable development in tourism economies.

Whispers of Ambition: Unpacking Emotions in Entrepreneurial Orientation of Women-Led Family Businesses

MICHELA FLORIS¹ ANGELA DETTORI² RICHA GOEL³ TILOTTAMA SINGH⁴

Abstract

This study aims to explore the nuances of EO within the context of women-led family firms through a multi-case analysis of 7 women-led family firms. Findings extend previous studies by emphasizing the influence of emotional aspects, particularly uncovering the heavy role of guilt and shame that act as two ambidextrous emotions, by delineating different women-led family firms' EOs.

Key words *women-led family firms, women entrepreneurship, entrepreneurial orientation, multiple embeddedness.*

Framing of the research. *Entrepreneurial orientation (EO) encompasses the inclination to undertake entrepreneurial initiatives by leveraging innovativeness, proactiveness, and risk-taking (Miller, 1983). This inclination extends to family businesses, recognized as crucial contributors to global economic growth and wealth (Kellermanns et al., 2008; de Groot et al., 2023). Family businesses, owned and overseen by the founding family, embody family beliefs and values, aiming to pass on the business across generations (Aronoff & Ward, 2011). Given the challenging business environment, engaging in entrepreneurial initiatives becomes crucial for the long-term survival of family businesses, leading to a surge in scholarly attention towards EO (Hernández-Linares & López-Fernández, 2018). However, despite extensive research on EO in family firms, there is a dearth of research on EO in women-led family firms (Sherlock et al., 2023), probably due to the prevailing focus on heroic male founding owners, which reinforces stereotypical notions (Braun et al., 2017). While recent progress acknowledges women as active contributors to family firms (Cruz et al., 2019; Nehili et al., 2018), challenging the historical perception of them as invisible or "Chief Emotional Officers" (Lyman, 1988), there is a surprising lack of studies specifically examining EO in women-led family firms (Madison et al., 2021; Bang et al., 2023; Fuentes-Fuentes et al., 2015; Gundry et al., 2014; Gupta & Levenburg, 2013; Kickul et al., 2010)), in contrast to the increasing studies on women entrepreneurship, urging further investigation to "capture more and richer aspects" (Ahl, 2006, p. 610).*

This paper seeks to fill this critical gap in the literature by exploring the unique nuances of EO within the context of women-led family firms. These firms represent an illuminating setting for investigating EO dynamics, specifically focusing on emotions. Family businesses, in fact, renowned for their robust emotional ties and moral attachment (Jaskiewicz & Dyer, 2017; De Massis & Foss, 2018), are increasingly recognized in recent research as arenas where emotions significantly, if not entirely, impact strategic decision-making (De Massis, Chua, & Chrisman, 2008; Humprey et al., 2021; Picone et al., 2021). Thus, this study aims to unravel how emotions shape the EO of women-led family firms through the lens of the multilevel embeddedness perspective (Aldrich et al., 2023; Wigren-Kristoferson et al., 2022). This perspective provides a deeper understanding of how women are seen within a complex structure, including individual roles, family interactions, and business environments. These elements contribute to their burden of emotions and the consequent acquisition of values, standards, and role anticipations, which can influence their attitudes, abilities, and actions, particularly on a personal level (Khanin, 2013; Khanin et al., 2012). In other words, factors such as motherhood, family care, and challenging social norms can evoke positive and negative emotions that serve as building blocks of their individual EO, shaping a unique firm's EO. In this sense, emotions can be considered as parts of the entrepreneurial process, influencing opportunity recognition, decision-making, and venture performance (Foo, 2011).

Purpose of the paper. *In light of the previous assumptions, this study aims to answer the following research questions: a. How do emotions shape (or affect) the entrepreneurial orientation of women leading family firms? b. How does this influence impact the overall entrepreneurial orientation of women-led family firms? To answer the research*

question, the study is based on a multi-case analysis of 7 women-led family firms.

Methodology. Due to the under-investigated topic, this study employs a qualitative methodology with an inductive and interpretive approach, utilizing a multi-case study (Eisenhardt & Graebner, 2007; Karra et al., 2006; Yin, 2008). This approach facilitates an in-depth investigation of a contemporary phenomenon within its authentic real-life context (Koporcic et al., 2019; Pettigrew, 2014; Yin, 2008). Qualitative research design holds relevance in the field of organization and management studies because it allows for "understanding the dynamics present within single settings" (Eisenhardt, 1989, p. 533). Moreover, it is especially fitting for family business studies, aiding in penetrating the veil of family dynamics and avoiding collecting irrelevant data (De Massis & Kotlar, 2014; Litz, 1997).

The multi-case study design emerges as a well-suited methodology as it addresses situations with manifold variables embedded in the investigative context and relies on multiple sources of evidence, converging in a triangulation fashion (Yin, 2013). Moreover, the multi-case approach is a fitting theory-building method deeply rooted in empirical data. Gathering information through interviews and combining it with factual data enables the production of accurate, interesting, and testable theories (Eisenhardt & Graebner, 2007).

We selected women entrepreneurs based on articles in the press, seminars, and personal contacts. We also found interesting cases by means of the snowball effect, asking women interviewed to suggest to us other women leading a family business. We reached the saturation point (Suddaby, 2006), establishing seven cases (see Table 1) that sounded rich in information and adequate, also under the suggestions of Eisenhardt (1989). Information-rich cases provide substantial insights into issues central to the research's purpose.

Table 1 - Sample characteristics

FIRM CHARACTERISTICS				WOMEN CHARACTERISTICS					Length of interviews (in minutes)
#	Firm activity	Foundation	Generation	Age	Education level	Marital status	Child.	Year of entrance in ownership and/or managerial roles	
1	Agriculture and farming	1970	3	44	Bachelor Degree	Married	2	2021	42.31 - 40.00
2	Artisanship	1990	2	48	Master Degree	Divorced	1	2014	41.02 - 39.30
3	Tourism	1950	3	42	Master Degree	Married	2	2019	38.17 - 42,15
4	Industry	1970	3	50	Bachelor Degree	Divorced	3	2013	39.30 - 35,30
5	Tourism	1994	2	52	Bachelor Degree	Married	2	2000	38.59 - 42.00
6	Agriculture and farming	1934	6	48	Master Degree	Single	1	2012	43.45 - 40.00
7	Industry	1978	3	46	Master Degree	Married	3	2001	40.00 - 38.40

Data Gathering. This research employed a combination of primary and secondary data sources. For primary data collection, we conducted comprehensive semi-structured interviews both in-person and via Teams, adhering to a two-part interview protocol (Legard et al., 2003). Throughout 2023, we conducted 14 semi-structured interviews with seven women entrepreneurs managing their family firms, each lasting approximately 40 minutes. The initial part of the interviews focused on obtaining demographic information and understanding the firm's history. The subsequent part delved into exploring the influence of emotions on individual women entrepreneurs' Entrepreneurial Orientation (EO) and its reflection on the entrepreneurial orientation of family firms. Specifically, the interviews scrutinized emotions from three levels of analysis - individual, family, and firm. Conducted in Italian, the interviews were audio-recorded, translated into English, and transcribed verbatim by the authors, following the interviewees' prior authorization through signed informed consent forms. The interview questions were crafted to encourage open discussions about the interviewees' experiences and personal perspectives, avoiding the use of technical terms from academic literature.

Secondary data included personal documents, archives, newspaper articles, website content, and social media materials. This data elucidated interview content and enhanced our understanding of innovation proclivity, proactiveness, and risk-taking in instances where interviews were insufficient.

Data Analysis. Following the completion of interview transcriptions, three independent coders engaged in a thorough review, scanning for emergent themes crucial for addressing the research question (Reay & Zhang, 2014). To ensure the integrity of our analysis, we chose a content analysis approach without using software like NVivo to avoid potential biases in Cohen's kappa (Kim et al., 2016). Cohen's kappa, designed for character-level reliability assessment, proved unsuitable for our study, which operated at a higher unit of analysis (e.g., sentence and paragraph). Our content analysis method combined the nomothetic approach advocated by Eisenhardt (1989) with the Gioia methodology (Gioia et al., 2013). Utilizing the Gioia methodology, we visually represented the data processing journey, showcasing the transformation of raw data into themes. This progression moved from first-order concepts to second-order themes and aggregate dimensions (Figure 1). In the first-order coding phase, we scrutinized interview content to generate items, which were then squared to identify multiple themes aligned with theoretical orientations derived directly from the interview material. These themes laid the groundwork for developing subthemes and units of meaning. In the subsequent second-order coding step, as recommended by Gioia et al. (2013), we aggregated items from the initial phase at various

levels of abstraction (Thiéart, 2014).

Throughout the analysis, we iteratively alternated between qualitative evidence and existing theory (Denzin & Lincoln, 2000; Silverman, 2001). This iterative process allowed us to leverage existing insights to enrich our theory, unveiling novel perspectives. As the theoretical framework gained clarity, we systematically compared it with the literature, accentuating similarities, and differences from prior research. This iterative comparison enhanced internal validity, refining constructs and relationships.

The resulting theoretical logic represents a synthesis of arguments derived from case evidence, existing research, and standalone logical reasoning, aligning with the approach advocated by Eisenhardt and Graebner (2007).

Fig. 1 - The data structure

Results. The preliminary analysis of the interview results reveals that emotions originating from various levels (individual, family, and business) significantly impact women's individual EO with relevant effects on the firm's EO.

In particular, we noted that from the individual level, emerge: a. frustration ("Unfortunately, I'm often frustrated because I can't carve out time to take care of myself, and this leads me to almost feel repulsed by new initiatives to launch in my family business. I fear that adding more to my plate could create even more challenges for me. - Case 1); anxiety ("By nature, I fear failure (...). I received a very strict upbringing where one always had to strive for excellence and perfection. This limits my ability to invest in highly risky ventures. Anxiety overwhelms me immediately, and I don't sleep for days..." - Case 2). From the family level, the following emerges: a. anger ("Sometimes I feel anger towards my husband. He should support me, but instead, I perceive him as distant. This sense of loneliness doesn't aid in managing my business because it's like navigating a ship during a storm. I fear going further because I worry that at any moment, the ship might sink." - Case 4); b. sense of support ("My life is a challenge, but I'm not alone. I've my family. (...) In my entrepreneurial journey, my strong sense of security and support within my family inspires me to face challenges confidently and embrace innovation. Knowing I have a secure nest at home feeds my proactive approach in business." (Case 7). Finally, from the firm level emerges a. sense of loneliness ("Too often, I feel alone in facing family and work challenges. Not always do my colleagues support me. That's why I think a lot before making any changes in my business." - Case 3); b. determination ("I am determined, and my business has grit. I love change, chaos, and creativity. Everything is a continuous work-in-progress in my life." Case 7).

However, despite the variety of emotions that surfaced from different levels, surprisingly, three crucial emotions emerged at each of the three observed levels, significantly impacting individual EO. These emotions-guilt, shame, and satisfaction-appear to shape individual EO, subsequently determining four specific configurations of firms' EO. This influence is a result of the positive or negative effects of the emotions that have arisen in women's entrepreneurial behavior.

Figure 2 summarizes the findings:

Analytical EO

When satisfaction, guilt, and shame emerge as relevant emotions but are managed subtly considering them, the women's EO can be described as "**detached**." This implies a decision-making style that leans towards rationality and objectivity, with a limited impact of emotions. The resulting firm's EO could be characterized as "**analytical**," emphasizing data-driven strategies and focusing on efficiency and financial performance. In this context, women-led family firms exhibit an EO marked by a profound focus on risk-taking initiatives. Every innovative endeavor seems to result from a meticulous evaluation of costs and benefits. Rationality seems to prevail over emotions.

The following quote can better explain the concept:

"Frequently, I grapple with a sense of guilt over the limited time I allocate to my family and personal well-being. Entrepreneurship demands much from me, and there are moments when I feel inadequate, unable to meet every challenge. This internal struggle leads to personal dissatisfaction and a sense of defeat for not delivering my best in all areas. However, I'm fortunate to be learning the art of detachment and rationalization within the business, seeking support from others along the way. Managing every aspect of the business, including my emotions, is crucial. Maintaining a rational

perspective, even in the face of chaos, has become my key to success. (...) Constant innovation requires us to silence the heart and engage the brain, often with a calculator by our side (laughter)" - Case 2

Responsibility-Driven EO

When feelings of guilt and satisfaction become evident, and shame is perceived as a motivating force to achieve even greater results, women's EO can be labeled as "rewarding." This fosters a "responsibility-driven" EO oriented toward responsibility within the firm. The perception of a high level of personal satisfaction and the acknowledgment of guilt as a catalyst and driving force for continuous improvement, based especially on introducing constant innovation to be leader in the market, can mitigate the negative effects caused by the sense of shame that women entrepreneurs sometimes feel when encountering gender-related biases. This circumstance fosters in these entrepreneurs the determination to create a work environment free from prejudices, shaping a forward-thinking EO capable of integrating ethics and responsibility into business strategies.

The concept emerges from the following exemplary excerpt:

"Being women entrepreneurs means striving to create an organizational climate centered on responsibility. (...) as a woman, I strongly feel the sense of guilt for the family sacrifices, but it's also my great strength. I owe it to them. (...) I am very satisfied with what I do, because I face several challenges, and even though my motivation often wavers due to a feeling of inadequacy that many people impose on me simply because I am a woman entrepreneur, I bounce back and try to ensure that my company not only focuses on ruthless growth. (...) for this reason, my family firm is a leader! Because I'm very innovative and my firm too. We anticipate our competitors following a different strategy: combining entrepreneurial spirit with the awareness of the burden of responsibility towards everyone" (Case 7).

Emotional strain EO

When feelings of guilt and satisfaction arise, but their impact is perceived as negative, and shame is considered a significant and stimulating emotion affecting decision-making, women's EO may be labeled as "forced." This individual EO is inclined to create an "emotional strain" firm's EO. The term "forced" underscores a sense of external pressure on the individual EO, while "emotional strain" emphasizes the challenging emotional burden experienced at the individual, family, and firm levels. In this case, the firms' EO is characterized by reluctance toward risk-taking, considered a concern rather than the opportunity of grow.

The following quote is particularly meaningful and denotes the continuous tension that emotions create:

"There is still much to do for us female entrepreneurs. We have to prove that we can do everything. (...) Since I was a child, I felt that I was not up to my father's expectations. Today, this feeling of shame for never being enough gives me a huge push to improve and to always seek to be appreciated as an entrepreneur, as a woman, and as a mother. (...) I put a lot of effort into what I do, but then I feel a strong sense of guilt towards my family. It seems to me that I am neglecting my duties as a wife and mother. (...) It makes me feel bad, and I feel oppressed and dissatisfied. On the one hand, I want to soar high; on the other hand, I realize that I am like a kite, always guided by someone else. (...) this is the reason for refusing very risky initiatives. The fear of losing financial resources discourages me from accepting even more challenging adventures" (Case 2)

Captivating EO

When feelings of guilt, shame, and satisfaction serve as pillars of women's EO, the individual EO can be characterized as 'captivating.' Translating this individual orientation into the firm's EO seems to outline an 'emotionally-driven' firm's EO. In this context, 'captivating' refers to the compelling and engaging nature of the individual entrepreneur's emotional experiences, which, when applied to the firm, suggests that the firm's EO is strongly influenced by emotional factors and a focus on psychological well-being. This generates a firm's EO strongly focused on being innovative and proactive.

The following quote can clarify the concept:

"Of course, like all career women, I feel guilt towards my family, especially my children, of course. However, this pushes me to make the most of my time. (...) I am not one to procrastinate, and I translate this characteristics also in my firm. (...) Time is a very competitive variable, and my firm needs to anticipate competitors to be the leader in the market (...) This gives me a lot of satisfaction (...) and when I find myself having to prove that I am skilled and competent, while a man doesn't need to prove it, I feel a strong sense of embarrassment, almost shame because I fear making a mistake. But this unpleasant feeling gives me even more determination and drives me to move forward, to be even more innovative, always, with my head held high." (Case 5)

In summary, our findings shed light on the pivotal influence of emotions in shaping both the individual EO of women and the overall EO of firms. We delineate distinct traits in individual EO and dynamic patterns at the firm level, classifying them based on the emergence and intensity of specific emotions—guilt, shame, and satisfaction. This study bridges a significant gap in the existing literature by offering innovative insights into EO within family firms led by women. Making substantial contributions to family business studies and women entrepreneurship research, the study builds on previous research by emphasizing the importance of emotional factors and revealing the unexpected roles of guilt and shame as two ambidextrous emotions in entrepreneurial decision-making. Despite being initially perceived as inhibitors, our research accentuates their positive aspects, portraying them as catalysts contributing to a well-defined and nuanced firm's EO. In sum, women-led family businesses appear to be sensitive toward sustainability, transcending environmental concerns and encapsulating the well-being of individuals and the societal impact of business practices. Exploring the nuanced emotional dynamics within women-led family firms sheds light on how these dynamics influence sustainable business practices and individual well-being. By understanding the roles of emotions, this study provides insights into how emotional well-being can be integrated into business strategies, thereby contributing to the sustainability of the business and the health of family relationships. Such insights are crucial for aligning with the contemporary push toward holistic sustainability in business management. Specifically, exploring the nuanced emotional dynamics within women-led family firms spotlights a critical aspect of sustainable management practices that support individual well-being and broader societal benefits. The focus on emotions and their impact on entrepreneurial orientation underscores the importance of emotional sustainability in maintaining healthy business and family environments. This study contributes to our understanding of sustainable management in family businesses by addressing how these emotions influence strategic decision-making and leadership styles.

Furthermore, the study sheds light on women entrepreneurs' pivotal role in fostering environments that prioritize emotional well-being, thereby enhancing the firm's resilience and ethical stance.

Finally, exciting insights on father-daughter analysis emerge from our initial analysis that can extend Cesaroni et al. (2015)'s study. We suppose that emotional and professional support from fathers profoundly influences daughters' entrepreneurial orientation (EO) and leadership styles. Daughters who received strong emotional backing and professional mentorship were more likely to undertake innovative ventures and adopt assertive management roles, enhancing the firm's sustainability and innovation. For instance, participants noted that fathers' support not only prepared them for leadership but also inspired confidence and a propensity for risk-taking, which are crucial for navigating traditional gender roles and driving business growth. This dynamic contributes significantly to business governance, succession planning, and the fostering of a sustainable business model, thereby illustrating the essential role of paternal influence in shaping the strategic direction of family-owned firms.

Research limitations. The primary limitations of this study lie in the exploratory methodology chosen, driven by the novelty of the research and the necessity for a longitudinal approach. This is crucial to explore whether and how the impacts of guilt, shame, and satisfaction on individual EO among women, and subsequently on the EO of family firms led by women, evolve over an extended timeframe. To enhance the robustness of our findings, future research endeavors could broaden the sample size, thereby enabling a more comprehensive understanding of whether the results can be generalized. Additionally, repeating the same analysis within the sample firms would contribute to exploring potential variations. Furthermore, adopting a cross-country perspective would be particularly intriguing, shedding light on how emotions change within diverse cultural settings.

Managerial implications. This research underscores the significant impact of emotions on the EO of family firms led by women. By delving into the perceptions of emotions among women entrepreneurs and their integration into the EO of family businesses, valuable strategic insights have surfaced. As the prevalence of women's ownership and management in family enterprises continues to rise, grasping the intricacies of their emotionally oriented EO becomes crucial for a comprehensive understanding of this phenomenon. Consequently, the findings suggest compelling considerations for women, family entrepreneurs, and consultants, providing valuable insights to assess the evolutionary potential of firms and the societal shifts in women's entrepreneurship.

Originality. This study is original in its nature. To our knowledge, there is a lack of research that challenges this relevant topic. Thus, this research is original in both management studies and entrepreneurship studies.

The impact of board gender diversity on family firms' value: the mediating role of environmental innovation

FRANCESCO GANGI¹ MARIA COSCIA² LUCIA MICHELA DANIELE³ NICOLA VARRONE⁴

Framing of the research. *The 2023 Nobel prize winner Claudia Goldin (2014, pp. 1091), recalling the profound challenges that global society has faced in recent years, stated that “Of the many advances in society and the economy in the last century, the converging roles of men and women are among the grandest”. While we have made significant progress towards gender equality, there are still significant obstacles requiring our attention and action. The 2023 Global Gender Gap Report (WEF, 2023) indicates a modest recovery of female representation in corporations while highlighting a decline in women's representation in leadership roles. Thus, the issue of gender inequality in top-level positions remains a still persistent challenge. This is a timely question related to the wider theme of gender diversity in organizational apical roles, such as boards of directors. As part of the multifaceted gender diversity concept, board gender diversity (BGD) can be defined as “the equitable or fair representation of men and women on corporate boards” (Nuber and Velte, 2021, p. 1959).*

Consistent with recent surveys (e.g., EY, 2023), BGD is also a challenge in certain organizations that have attracted the academic and practitioners' interest due to their peculiar business approach, such as family firms (FFs). The specific organizational setting of FFs is depicted by literature as the “engine of global economy” (Chen et al., 2014), since they manage most economic activities worldwide (De Massis et al., 2018), and emphasizes noneconomic factors in decision-making (Berrone et al., 2012). Among the noneconomic motivations of FFs, we can highlight the preservation of socioemotional wealth (SEW) asset (Gómez-Mejía and Herrero, 2022), which includes nurturing family reputations, retaining family control, adhering to family values, and ensuring continuous business and generational succession (Gómez-Mejía and Herrero, 2022). In this perspective, gains or losses in SEW represent the main reference point in FFs decision-making. Accordingly, FFs are required to design corporate governance (CG) bodies that help a unique business approach to achieve financial robustness, without jeopardizing SEW preservation.

Following the theoretical lens of SEW, prior literature (e.g., Maseda et al., 2022; Wang et al., 2023) suggests that FFs can provide a more favourable organizational climate to empower female leadership. Specifically, FFs' propensity to nurture social and emotional ties between the family and stakeholders might resonate with communal psychological and behavioural traits historically credited to women (Spence & Helmreich, 1978). Attributes such as care, empathy, social orientation, and risk aversion can make women effective stewards of corporate social capital assets. Accordingly, female involvement in FF governance may incentivize business stakeholder orientation, while preserving SEW. At the same time, following prior studies (e.g., Reguera-Alvarado et al., 2017; Galbreath, 2018), a more diverse gender board composition is expected to enhance corporate financial performance (CFP), through the involvement of different perspectives and skills in decision-making.

However, the impact of increased female representation in CG bodies on FFs' financial goal is still a relatively unexplored topic. Indeed, findings in the extant FF literature are mixed or suffer from generalizability limits, thus leaving unanswered the question. Specifically, some studies show a positive impact of BGD on CFP (e.g., Gordini & Rancati, 2016; Vieira, 2018; García-Meca & Santana-Martín, 2023), while other research (e.g., Chadwick & Dawson, 2018) do not confirm this positive link in the specific FFs organizational setting. Other studies, then, are context specific and focus on single countries, such as Italy (Gordini and Rancati, 2017), Spain (García-Meca & Santana-Martín, 2023), and Portugal (Vieira, 2018).

Accordingly, the current study aims to investigate how BGD in FFs can led to higher CFP. Moreover, given the mixed results from previous research, the current study approaches this relationship by also taking into consideration additional factors that may influence it. In this regard we consider two aspects distinguishing FFs, that is: the aim of preserving noneconomic goals (Gómez-Mejía and Herrero, 2022); the propensity to create benevolent ties with stakeholders through the engagement in corporate environmental responsibility (CER) (Miroshnychenko et al., 2022). This propensity can be

⁴ University of Campania “L. Vanvitelli”
e-mail: nicola.varrone@unipegaso.it

also connected with the broader scenario of climate changes that have introduced new risks and new opportunities for FFs, thus amplifying the relevance of CER (Bathia, 2021). As consequence, FFs must rethink their business models, while developing green innovative solutions that support environmental sustainability. Hence, CER emerges as prominent business strategy aiming at minimizing the environmental impact of family business activities, by focusing on reducing emissions, using natural resources efficiently, and fostering eco-innovation. Accordingly, the CER is a multi-soul construct (Melo & Garrido-Morgado, 2012), encompassing the capability of firms to generate environmental innovation (Dangelico, 2017; Bathia, 2021).

This growing awareness towards CER has led to the widespread adoption of environmental innovation to achieve a win-win scenario. On the one hand, through CER-orientation in innovative projects, FFs may be strategically aligned with environmental goals, including the mitigation of the negative impact on the environment (He & Jiang, 2019). On the other hand, prior studies (Dangelico, 2017; Bathia, 2021; Gangi et al., 2021), underscore how engagement in green practices can produce tangible and intangible assets, reinforcing CFP and reputation among stakeholders. From this perspective, the environmental innovation can be considered as a cospecialized asset that improves the value of other firm assets (McWilliams & Siegel, 2011), thereby fostering firms' value.

Based on these premises, the link between BGD and CFP may benefit from the level of FFs' CER innovation. This impact is consistent with the preservation of noneconomic goals (e.g., Berrone et al., 2012; Gómez-Mejía & Herrero, 2022), while preserving the continuity of FFs (Hauck et al., 2016).

Consistent with our research framework, based on a worldwide sample of 335 FFs (2009-2020), we first explore the effect of BGD on company's value (Tobin's *Q*). Then, we deepen the link between BGD and FFs' value by investigating the mediating role of environmental innovation.

Purpose of the paper. Over the last years, a growing number of studies have analysed how the proportion of women on corporate boards influence CFP, showing mixed results. Within the FFs context, some studies show that BGD has a positive effect on financial outcomes (e.g., Reguera-Alvarado et al., 2017; Galbreath, 2018), while other studies find inconclusive or negative relationships (e.g., Chadwick & Dawson, 2018; García-Meca & Santana-Martín, 2023; Chapple & Humphrey, 2014; Yarram & Adapa, 2023). These divergence calls for further exploration.

The link between BGD and CFP can be interpreted through the lens of the resource dependence theory (Pfeffer & Salancick, 1978), which states that corporations operate in an open system, and need to exchange different resources for survival. In this sense, as corporate boards are responsible for a firm's strategic orientation (Naciti, 2019), the effectiveness of strategic actions may depend on the mix of resources that directors are able to bring to the board. Indeed, Hillman et al. (2002) argue that gender diversity may be a source of social capital, experience, skills, and networks. In the same vein, Reguera-Alvarado et al. (2017) and Chadwick and Dawson (2018) provide evidence that BGD promotes the integration of broader perspectives and different informational resources that can improve the understanding of the competitive context, thus strengthening the conditions of a positive link between BGD and improved business outcomes (Reguera-Alvarado et al., 2017).

Consistent with Makkonen (2022), boards can benefit from gender diversity in terms of the management of knowledge resources. In particular, greater BGD may result in different ideas and perspectives that may support the ability to value, assimilate and apply new knowledge within the organization. In this sense, diversified boards of directors embody a "healthy mix" of different competences and capabilities that, in turn, may improve the identification of business opportunities and the adoption of innovative solutions (Lu & Herremans, 2019). Accordingly, consistent with FFs prior literature (e.g., Gordini & Rancati, 2016), demographic features, such as board members' gender, may stimulate organizations' creativity and innovation. The fallout of this positive link between BGD and competitiveness can be measured through the increase of FF value, which synthesizes improvements in operational performance from including women in top level managerial decision making, and the reward to BGD from financial stakeholders. Indeed, consistent with the study of Chadwick & Dawson (2018), capital markets show increasing concerns with the convergence of improved business outcomes and social inclusion goals. An additional factor to justify a positive association between BGD and FFs' value. In the same vein, Galbreath (2018) argue that CG mechanisms and an organizational climate that are favourable to female empowerment in leadership positions, may contribute to enhancing the company value.

In light of the above, we posit the following:

H1: BGD positively affect FF value

Under the lens of SEW, Agostino and Ruberto (2021) state that FFs managers may tend to develop an eco-friendly consciousness, due to the high priority to non-financial goals (e.g., family identity, longevity, trustful relationship with local communities). Specifically, the adoption of environmental innovation could be a means for FFs to fulfil social expectations and obtain high social status in the community (Berrone et al., 2012). In this regard, earlier studies (e.g., Zaman et al., 2023) underline BGD as positive leverage of eco-innovative investments due to the greater female attitude to emphasize environmentally-related managerial issues. More specifically, women tend to a higher sensitivity towards the needs of other people, thus incentivizing the board's decisions for the welfare of the community, as in the case of the adoption of eco-responsible practices (Lu & Herremans, 2019; Nadeem et al., 2020).

The above arguments are rooted in psychological literature, that identified people's beliefs regarding female and male attitudes into two behavioural aspects, i.e. communal and agentic (Spence and Helmreich, 1978), which contribute to shape gender stereotypes. Women are commonly correlated to communal traits like morality, empathy and concern

with others, whereas men are mostly associated to the agentic traits like assertiveness and competitiveness. This vision aligns with the expectation that women are inclined to show greater orientation toward corporate sustainability practices and act in alignment with CER principles. In this sense, previous research on women in top management positions indicates that the growing BGD leads to increased engagement in CER (Orazalin and Baydauletov, 2020). This is because, compared to men, women are more likely to exhibit greater sensitivity to the demands of stakeholders and are more supportive of ecological concerns (Boulouta, 2013). Additionally, the female leadership style is correlated to greater awareness of environmental risks and a proactive attitude towards addressing the concerns of environmental stakeholders (Nuber and Velte, 2021). Consequently, as corporate boards functioning is essential for debating on managerial concerns (Naciti, 2019), the eco-conscious characteristics of female directors can influence board discussions, guiding the board towards making CER-focused decisions, including the adoption of environmental innovations.

Thus, under these theoretical grounds, the greater attention of women directors towards ecological issues is likely to lead to a greater engagement of the FF in eco-friendly innovations.

The CER engagement entails practices aimed at reducing ecological footprint and preventing natural depletion by designing environmentally sustainable products (Dangelico, 2017). Kemp and Pearson (2007, p. 7) define environmental innovation as “the production, assimilation or exploitation of a product, process, service or management or business method that is novel to the organization and which results, through its lifecycle, in a reduction of environmental risk, pollution and other negative impacts of resources use compared to relevant alternatives”.

The growing interest of customers and regulators (Khan et al., 2021) for green products and eco-business models fuelled the academic research on the business effect of environmental innovation. In this regard, prior literature (e.g., Dangelico, 2017; Bathia, 2021) highlights how to be compliant with environmental responsibility can foster competitive advantage through reduced operational costs, improved efficiency in resources use, and less polluting business processes. Specifically, following the RBV perspective (Barney, 1991), by intensifying their commitment to environmental innovation, firms can develop strategic resources that are both valuable and difficult for competitors to imitate, such as advancements in green technology, green knowledge and capabilities, higher resource efficiency, and green innovation stewardship, all factors reinforcing competitiveness (Gangi et al., 2021).

Moreover, according to the stakeholder theory (Freeman, 1984), environmental innovation can bolster CFP by fostering trustful relationships with stakeholders, thus reinforcing reputational capital (Surroca et al., 2010). From these perspectives, Dangelico (2017) indicates that companies engaged in the design and the implementation of environmentally friendly products and practices improve their reputation among financial stakeholders, since are less exposed to stakeholder sabotage and future liabilities (Barnett and Salomon, 2012). Furthermore, through eco-innovation, companies can better align their business models to environmental regulations, thus limiting risks of legal disputes. Accordingly, as “co-specialized asset” (McWilliams and Siegel, 2011), environmental innovation contributes to better CFP, by improving competitiveness and corporate reputation, while mitigating firm risk (Gangi et al., 2021).

In light of the above, we posit the following:

H2: Environmental innovation mediates the relationship between BGD and FF value

Methodology. To test our hypotheses, we adopt an international sample of FFs, starting from the list of the World’s Top 750 Family Businesses (Family Capital). We match the Family Capital list with the Refinitiv database to obtain information on BGD and environmental innovation and retrieve financial data from the Worldscope database. We remove 416 FFs due to a lack of information on BGD, environmental innovation or financial characteristics during the study period (2009-2020). This procedure results in a final sample of 335 FFs.

As dependent variable, we proxy FF value through Tobin’s Q . Consistent with Kim and Lu (2011), we compute Tobin’s Q as the sum of the market value of common stocks plus the book value of total liabilities divided by the book value of total assets. As independent variable, consistent with García-Meca and Santana-Martín (2023), we rely on the percentage of female directors (BGD) as measure of gender diversity on corporate boards. Moreover, the mediating variable is represented by the Refinitiv’s environmental innovation score, reflecting a company’s capacity to reduce the environmental costs and burdens for its customers, and thereby creating new market opportunities through new environmental technologies and processes or eco-designed products. About the controls, we adopt the number of independent board directors (B , independence); dummy variable equal to 1 if a CEO chairs the board or if the chairperson of the board has been the CEO of the company, 0 otherwise (CEO duality); total debt divided by total capital (Leverage); the FFs size (Size), as the natural logarithm of the number of employees; capital expenditures on sales (Capex); the firms’ age (Firm Age); finally, we include GDP growth and GDP per capita to control for countries’ economic heterogeneity.

Regarding the empirical strategy, this study adopts the Baron and Kenny (1986) mediation technique, that requires the estimation of three regression equations. First, we estimate the influence of BGD on environmental innovation. Second, we evaluate the effect of BGD on firm value. Finally, we assess the impact of both BGD and environmental innovation on the firm value of FFs. The three equations are formalized as follows:

$$E\text{-innovation}_{i,t} = \beta_0 + \beta_1 BGD_{i,t-1} + \beta_2 X_{i,t-1} + \varepsilon_{i,t-1} \quad (1)$$

$$FV_{i,t} = \beta_0 + \beta_1 BGD_{i,t-1} + \beta_2 X_{i,t-1} + \varepsilon_{i,t-1} \quad (2)$$

$$FV_{i,t} = \beta_0 + \beta_1 BGD_{i,t-1} + \beta_2 E\text{-innovation}_{i,t-1} + \beta_3 X_{i,t-1} + \varepsilon_{i,t-1} \quad (3)$$

where $E\text{-innovation}_{i,t}$ is the degree of engagement in environmental innovation of FF_{*i*} at time *t*; $BGD_{i,t-1}$ represents the measure of board gender diversity of FF_{*i*} at time *t-1*; $X_{i,t-1}$ is a vector of control variables at time *t-1*; $FV_{i,t}$ reflects the firm value of FF_{*i*} at time *t*; and ε is the random error term. Based on evidence from the Hausman test, we perform the three regression equations and adopt fixed effects estimators. All of the independent and control variables are lagged by 1 year to smooth possible reverse causality issues.

Results. Table 1 provides the sample descriptive statistics, and Table 2 reports the correlation analysis. All variables have correlation coefficients below the conventional level of 0.70 (Ratner, 2009), thus indicating that the estimates are not likely to be biased by multicollinearity issues.

Table 3 shows the regression analyses relative to Baron and Kenny's (1986) procedure. In particular, models 1 and 2 show the estimate referring to the influence of BGD on E-innovation, while models 3, and 5 estimate the direct influence of BGD on CFP. Models 4, and 6, instead, display the estimates relative to the relationship between BGD and CFP, also including the environmental innovation (E-innovation) measure among the independent variables. Models 1 and 2 indicate that BGD at time *t-1* positively and significantly impacts E-innovation of FFs at time *t* (at a confidence level of 10%). The empirical models 3 and 5, instead, suggest that BGD at time *t-1* positively and significantly influences FF value at time *t*, at a confidence level of 1%. Thus, we confirm our first hypothesis of a positive impact of higher BGD on FFs value.

Considering, then, our second hypothesis on the mediating effect of environmental innovation, the results from models 4 and 6 indicate that E-innovation partially mediates the positive link between BGD and FF value. Independently from the presence of year dummies, we observe that the magnitude of BGD coefficients decreases in models with E-innovation. For example, regarding empirical models including year dummies, relative to model 5, the magnitude of the BGD's coefficient is lower in model 6. These results indicate that the engagement in environmentally friendly innovations mediates the link between the BGD and CFP, thus confirming our second hypothesis. With reference to control variables, empirical models 1 and 2 indicate that firm size and firm age have a positive and statistically significant influence on FFs' E-innovation. Models 3-5, instead, show that board independence has negative and statistically impact on FF value.

Research limitations. This study suffers certain limitations that could provide directions for further research. First, consistent with Chua et al. (2012, p. 3), FFs present many heterogeneous aspects, including firm size (Aiello et al., 2023). Thus, future studies can focus on smaller and larger FFs, to provide a more comprehensive understanding of how BGD impacts CFP across different types of FFs. Second, additional variables measuring both gender diversity and financial performance could be considered to further enrich the results obtained. Finally, while the current study is limited to mediation approach, future research could include the moderating influence of additional variables, as well as it may refer to others mediating variables. Addressing these limitations could significantly enhance the understanding of the interplay between gender diversity and financial performance in the context of FFs.

Managerial implications. Our study offers several practical implications. First, by enhancing female representation in CG bodies, FFs not only demonstrate commitment to diversity supporting improved reputation towards stakeholders, but also create effective synergies between environmental innovation and SEW assets, thus capitalizing the distinctive leadership style and managerial contribution of women. Second, this strategic approach positively influences financial performance, demonstrating the tangible benefits of integrating gender diversity into FFs' CG mechanisms. Third, for FFs managers, our findings underscore the importance of leveraging gender diversity to enhance environmental innovation strategies. The proactive engagement with gender diversity and environmental innovation can lead to new business opportunities, stronger competitive advantages, and alignment with evolving regulatory and consumer expectations around sustainability. Then, managers are encouraged to approach gender diversity not just as a compliance or ethical imperative, but rather as a strategic asset that can drive both environmental and financial performance.

Originality of the paper. This study offers several valuable contributions. Since the FF literature does not show consensus regarding the BGD and CFP link, it could be important to consider intervening variables to improve its understanding. In this sense, by disentangling the CER multi-soul concept, our study fills this void by considering the mediating role of environmental innovation. At the same time, we show the mediating role of environmental innovation through improved FF value, validating the benefits for financial and nonfinancial stakeholders of funding FFs that engage in environmentally conscious business practices. Finally, we shed light on the link between BGD and CFP by relying on robust evidence from large-scale multi-country empirical analyses. This approach addresses generalizability limitations of prior studies on FFs (e.g., Gordini & Rancati, 2016; Vieira, 2018; García-Meca & Santana-Martín, 2023).

Key words: Board gender diversity; environmental innovation; corporate financial performance; socioemotional wealth; family firms

The digital transformation process of SMEs to compete in the current business environment: evidence from an Italian case

GINEVRA TESTA¹ ANDREA CIACCI² LARA PENCO³

Abstract

Digital transformation is an essential process for SMEs to maintain their competitive advantage in today's highly competitive, dynamic, and changing landscape. SMEs possess characteristics that can facilitate digital transformation, such as flexibility and agility. At the same time, they have to overcome barriers, such as poorer financial resources than large companies. This study aims to explore the digital transformation process of SMEs, highlighting the factors that favor this transformation and, on the other hand, the elements that can slow down or obstacle this process.

The methodology pursued involves a single case study, an Italian SME operating in the sportswear sector. Semi-structured interviews were conducted with the company's top management, data enriched by the collection of secondary data to facilitate the triangulation of data, subsequently analyzed through a content analysis carried out with the Nvivo 14 software. The results that emerged from this analysis highlighted the importance of the entrepreneurial figure in fostering and stimulating the technological development of SMEs; adequate data processing to obtain more detailed and sophisticated forecasts capable of fostering higher performance standards, new business opportunities, and growth for SMEs; data in driving more thoughtful and reasoned decision-making processes that may, however, become more complex to manage; an enhanced consumer orientation that allows for better satisfaction of demand needs and requirements; and, finally, the crucial role of middle management in managing and orchestrating this digital transformation to avoid potential internal resistance. This research offers several managerial recommendations and insights for future research to explore the factors that can accelerate the digital transformation of SMEs.

Key words: digitization; digital transformation; SMEs; growth; content analysis; case study

Framing of the research. *Digital transformation has triggered significant changes in business models and business processes, requiring new organizational capabilities (Tan et al., 2015; Urbinati et al., 2020). In addition to requiring more specific skills, digital transformation also requires substantial financial resources, typically found in large companies, in which, however, flexibility and agility are more difficult to achieve due to the greater complexity of the corporate structure (Giotopoulos et al., 2017; Nasco et al., 2008). Therefore, digital skills can be acquired more quickly in small and medium-sized enterprises (SMEs) than in large organizations (Scuotto et al., 2021; Sousa & Rocha, 2019). Flexibility, agility, and leaner procedures resulting from a less complex organizational structure (Chan et al., 2019; Fletcher & Griffiths, 2020; Levy et al., 2001) are typical characteristics of SMEs that can facilitate digital transformation (Moeuf et al., 2017). While large companies are already benefiting from the opportunities of digitization and are already facing the challenges and difficulties of digital transformation, SMEs are often still in the early stages of this digital transformation journey (Moeuf et al., 2017).*

In addition to these characteristics of SMEs, the success of SMEs' digital transformation stems from their ability to acquire digital skills within the company, particularly in data analysis (Priyono et al., 2020) and the ability of SMEs to recognize new business opportunities arising from technology (Dutta et al., 2020). The proper management of big data, made available by the innovations introduced, enables SMEs to carry out better analyses and forecasts and understand market dynamics more effectively. Thus, once big data analytics capabilities are acquired, SMEs can enjoy a more complete picture of information concerning the target market and consumer preferences, enabling companies to make more informed decisions in line with market needs (Manika et al., 2017). Therefore, in today's digital ecosystem, the acquisition of certain specific digital capabilities is particularly crucial to respond to the needs of an ever-changing market (Parida et al., 2016; Ravichandran, 2018) that requires constant strategic alignment, i.e., continuous adaptation to proactively respond to exogenous market shocks (Canhoto et al., 2021). Some technologies, such as big data and machine learning, are priority tools to compete in today's digital ecosystem (Subramaniam et al., 2019). Predictive

models can be obtained from big data to identify behavioral patterns within the data and to manage market uncertainty more effectively (Ferraris et al., 2019). Therefore, in today's digital environment, these capabilities are essential to benefit from more accurate predictions and to seize all growth opportunities (Aquino-Arrieta et al., 2020). An important role is also played by corporate culture, which may be prone to technological innovation and thus facilitate or hinder digital transformation and organizational change (Garzoni et al., 2020). Thus, entrepreneurial orientation can greatly influence SMEs' technology investments (Anwar, 2018).

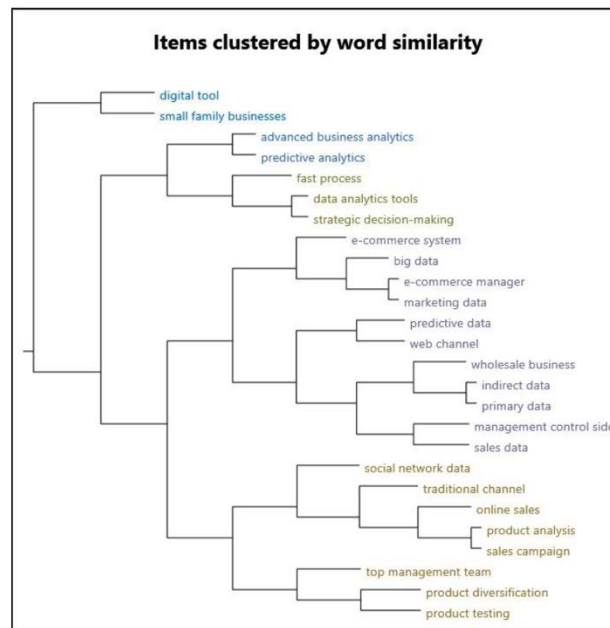

The digital transformation process of SMEs can start with the digitization of products and services and then move on to the digitization of business models and business processes (Soluk and Kammerlander, 2021). For example, SMEs can offer their products to a broader audience, including international audiences, using digital platforms (Li et al., 2018; Olvera-Lobo & Castillo-Rodríguez, 2018) and then move on to change internal processes and business models (Nwaiwu et al., 2020). According to Neirotti et al. (2017), SMEs exhibit higher agility in adapting their processes and business models than larger organizations. This heightened adaptability is attributed to the leaner organizational structure of SMEs, enabling them to reconfigure their business models swiftly and flexibly. Technology adoption and the use of digital platforms play a crucial role in defining the value proposition and taking advantage of an integrated information system (Cenamor et al., 2017). SMEs that manage to align their processes with the adopted technologies can achieve more in terms of growth, performance, and agility (Cragg et al., 2002; Kitchens et al., 2018; Matarazzo et al., 2021; Nasrollahi et al., 2021; Rialti et al., 2019). Therefore, a major challenge for SMEs remains to align their human and technological resources to transform themselves into data-driven companies (Sivarajah et al., 2017). It becomes crucial to effectively combine human intuition and increased knowledge from data (Lindebaum et al., 2020; Merendino et al., 2018). This combination gives rise to the need to manage potential problems, resistance, and organizational difficulties to grasp the opportunities arising from digital transformation. Given the complexity of digital transformation and the various dimensions involved, implementing insights from data into a strategic framework represents a gradual process. Indeed, understanding the technological potential and the routinization of processes concerning the new technologies implemented is a crucial and gradual process (Janssen et al., 2017).

Purpose of the paper. This study focuses on small and medium-sized enterprises as organizations of great relevance for the global economy (European Commission, 2022), in particular for the Italian context (Cardoni et al., 2023). Studies focusing on the evolution of SMEs' digital transformation are still rare in the literature (Marino-Romero et al., 2024). Therefore, addressing the complexity of SMEs' digital transformation, this study aims to explore the digital transformation process from an evolutionary perspective and the potential enabling and hindering factors of this process. Thanks to digital transformation, SMEs can maintain their competitiveness in the current competitive market, seizing new opportunities for growth and development (Matarazzo et al., 2021). In order to benefit from these opportunities, however, SMEs must make significant efforts to overcome potential difficulties and obstacles. In addition, digital transformation can insert SMEs, e.g., using digital platforms, into an international competitive environment in which large global giants also operate, paving the way for potential threats as well (Mazzarol, 2015).

Methodology. To achieve the research objectives, the study presents a single case study of an Italian SME operating in the clothing sector. The choice to focus on the Italian territory stems from the diffusion of this type of organization on the Italian territory, which is strongly characterized by an entrepreneurial management style and family-run organizations (Bresciani et al., 2016; Franceschelli et al., 2018). Since these are SMEs with a strong entrepreneurial figure, they are not usually inclined to release strategic information to the public. Therefore, conducting interviews is an excellent opportunity to come into direct contact with SMEs and to fully understand their internal dynamics (Matarazzo et al., 2021). Therefore, we opted for semi-structured interviews developed with the key informants of the Italian SME chosen as a case study. Specifically, we interviewed the top management, i.e., the heads of the finance, management control, and e-commerce functions. The interviews followed a protocol consisting of several open-ended questions on the topics under analysis and lasted, on average, about one hour each. In addition to the primary data from the interviews, secondary data were also collected from sources such as company reports or websites to obtain a data triangulation. The interviews were recorded after the interviewees' consent, transcribed in full, and translated from Italian into English for content analysis using Nvivo 14 software. Nvivo software has been widely applied in the social sciences and management studies to investigate complex phenomena (Kraiwani et al., 2023). Content analysis has been conducted using the open coding practice, suitable for studying intricate phenomena where multiple factors come into play (Ghezzi & Cavallo, 2020). In particular, the cluster analysis conducted on Nvivo allows the coded aspects within the data to be merged to bring out potential interesting connections and links. It is a particularly useful exploratory tool for identifying associations within qualitative data (Macia, 2015).

Results. Figure 1 shows the cluster analysis conducted by word similarity on Nvivo 14, allowing the subdivision of the topics from the interviews into five main clusters.

Fig. 1: Cluster Analysis

Source: Personal Elaboration from Nvivo 14 software

Cluster 1: Entrepreneurship and technology adoption

The first cluster highlights the typical characteristics of the company, i.e., a small to medium-sized family business, and how they influence technology adoption. In addition to business characteristics, the entrepreneurial figure can also strongly influence the technological development of the business. During the SME's growth and evolution, the entrepreneurial figure has stimulated the experimentation of new technologies and the change of business models to align with the growing technological adoption. Although entrepreneurial intuition is still recognized as crucial, today's business seems more driven by the data made available by the technologies implemented. These technologies function, therefore, as a tool to support the SME's strategic decision-making process. Therefore, many of its business activities today use new technologies and analysis tools to compete in today's increasingly competitive marketplace, adapting to the changing needs of demand. Therefore, from its inception around the 1970s to today, the company has experienced major transformations in business models.

Cluster 2: Data-driven and predictive analysis

The second cluster focuses on advanced analyses and the possibility of performing predictive analyses on the available data to obtain more sophisticated forecasts. These more precise forecasts enable SMEs to achieve higher performance and grow over time. However, the company states that it does not yet have adequate mechanisms for processing such data as it claims to still use rather rudimentary tools for processing. Therefore, the company demonstrates its future interest in investing in specific business analytics skills to foster this knowledge and predictive abilities. The data at hand, if properly managed and processed, allow for more complex analyses and more informed decision-making processes and, thus, enable the company to maximize results even with its stakeholders, such as agents and distributors, reducing the number of inventories and maximizing its sales.

Cluster 3: Decision-making process

The third cluster focuses on the theme of decision-making, which today can be much more data-driven. Thus, it emphasizes the shift from a decision-making process based on the entrepreneur's intuition to a decision-making process centered on the data available and, thus, on the possibility of making much more reasoned and considered strategic decisions. Using big data analytics in strategic decision-making reduces the probability of errors and improves the accuracy of the decision-making process. On the one hand, the greater amount of data available to be included in the decision-making process makes this process much more complex to manage. At the same time, however, it is possible to obtain much more comprehensive assessments of the landscape in which the company operates, using more in-depth analyses, scenario simulations, and risk assessments.

Cluster 4: Customer orientation through e-commerce

A fourth cluster focuses on the topic and role of e-commerce and the transition from a business model focused more on input sales to a more end-consumer-oriented business model. By using digital platforms, both direct and indirect, the company can benefit from much more information about its consumers and, thus, better meet their needs. Using such

platforms has required new data management capabilities from SMEs and multiple channels, as well as the need to protect their competitiveness from potential international competitors. Therefore, SMEs need to take full advantage of their flexibility and adaptability to remain competitive in the marketplace and attempt to meet more effectively the demands of an increasingly environmentally and socially aware public. These digital channels also allow SMEs to test new business strategies and seize new market opportunities.

Cluster 5: Structure of the decision-making process

Finally, the last cluster focuses on how SMEs' flexible and flat structure facilitates rapid decision-making and minimizes the bureaucratic time typical of large companies. This speed of decision-making enables SMEs to respond more quickly to market demands and to establish better partnerships with their stakeholders. However, entrepreneurial vision, managerial role, and strategic thinking remain crucial. The middle manager plays an essential role in orchestrating the evolutionary process of data-driven digital transformation of SMEs. Therefore, a combination of entrepreneurial insight and data analysis, offered by technologies, is needed to combine entrepreneurial intuition and empirical evidence in a synergetic way.

Therefore, the cluster analysis highlights the need for a combination of technology and entrepreneurship in the digital transformation process of SMEs, a process calling for specific skills to manage and process an ever-increasing volume of data. Therefore, the acquisition of dynamic capabilities is an essential element in the transformation process of SMEs (Ciacci and Penco, 2023; Soluk and Kammerland, 2021). Only acquiring digital and analytical skills and capabilities within the organization will enable digital transformation and the achievement of higher performance standards (Ramdani et al., 2022), such as a higher sales volume resulting from increased demand satisfaction. Consumers today also demand from SMEs a focus on environmental and social practices with their production (Le, 2023). Therefore, with their flexibility and agility, SMEs must reactively respond to market demands, benefiting from more comprehensive and reasoned decision-making processes facilitated by the combination of entrepreneurial intuition and multiple data at their disposal (Marino-Romero et al., 2024).

Research limitations. This study is not without limitations, as it only describes one case study. This does not make the results of the analysis generalizable. Future lines of research could explore the phenomenon by analyzing more cases within the Italian national territory densely populated by SMEs. Taking into consideration also different geographical contexts, from that of Italy, or different sectors, from that of clothing, could highlight some differences arising from cultural, economic, and social factors or sectoral dynamics that could accelerate or slow down the digital transformation of SMEs. A longitudinal analysis would allow a better understanding of the role of the different enabling factors within the different stages of SMEs' digital transformation.

Managerial implications. This study offers important managerial implications. It represents a useful guide for middle management in understanding how to facilitate the digital transformation process of SMEs, e.g., by fostering the development of big data analytics skills within the organization for better analysis and management of available data.

Middle management thus plays a crucial role in coordinating the digital transformation of SMEs (Annosi et al., 2023). Besides the relevant role of middle management, the entrepreneur's innovative spirit and a corporate culture open to innovation also facilitate and accelerate this process (Lin and Kunnathur, 2019; Urbinati et al., 2019). All these elements need to be properly nurtured and stimulated, e.g., by engaging in good integration between technologies and personnel to avoid potential resistance and difficulties. These aspects can be encountered when an entrepreneurial company transforms into a data-driven company (Lindebaum et al., 2020; Merendino et al., 2018).

By leveraging digital transformation, managers can identify new business opportunities and enhance performance. Using digital platforms, social media, and online review platforms, SME managers can have more information about their consumers and, therefore, experiment with new strategies to solve any problems recognized by the public. This knowledge enables SMEs to adapt their offer to market needs more effectively and, thus, increase sales. Therefore, digital technologies can enable SMEs to implement more effective strategies and optimize certain costs (Bouwman et al., 2019; Foroudi et al., 2017).

In summary, digital transformation offers SMEs powerful tools to improve customer insight, increase business performance, make forecasts more accurate, support data-driven decision-making, increase resilience, and better meet market demands. However, these opportunities require a strategic commitment to adopt and integrate these digital technologies into the company's core business to facilitate this transformation. SMEs often lack such capabilities and, therefore, should understand the need to find outside specialists who excel in data analysis (Erevelles et al., 2016). As these professionals are scarce and difficult to find in small and medium-sized companies, SMEs may establish strategic partnerships with others to benefit from specialized and highly trained knowledge (De Mauro et al., 2018). Otherwise, an absence of such capabilities would lead to a mismanagement of the available data. As a result, SMEs may make wrong decisions and lose favorable business opportunities (Manika et al., 2017).

Originality of the paper. The originality of this study derives from observing the digital transformation of SMEs from an evolutionary perspective, i.e., moving from the digitization of products to that of decision-making processes and business models. The study also highlights some enabling and hindering factors SMEs may encounter along their digital transformation process.

The focus on SMEs may be interesting in that much of the research in the digital transformation literature has focused on large organizations, neglecting the inherent difficulties of this process for organizations with fewer financial

resources. Therefore, exploring the digital transformation process of SMEs as a key to preserving business competitiveness in today's marketplace and increasing performance can enrich the academic debate and offer recommendations for both managers and policymakers who should consider how to incentivize the digital transformation of such relations, which are particularly important for the global economy.

Track 10
Strategic Communication

Millennials and Bookfluencers: a cross cultural analysis

LINDA GABBIANELLI¹

Abstract

Bookfluencers are social media influencer specialized in literature and books.

This study aims at investigating the perception of bookfluencers and their role in the purchasing process by Italian and French millennials.

The study is based on the results of a survey carried out through an online questionnaire. The sample under investigation is represented by 601 millennials.

Findings reveal that millennials perceive bookfluencers as believable people that provide honest reviews. Concerning the purchasing process, bookfluencers facilitate the search for information and the evaluation of alternatives.

Millennials are passive spectators by liking posts and have a low level of interactions with bookfluencers posts.

The study reveals also that there are significant differences in how they perceive bookfluencers and in their role in the purchasing process between Italian and French millennials. The study contributes to expand the literature on influencer marketing in a sector underinvestigated, that is the book sector and adopting a cross cultural perspective.

The limits of the work concern mainly the generational cohort investigated and the consumer perspective.

Key words: *social media influencers; millennials; books; cross-cultural analysis; Italy; France.*

Framing of the research. *The rise of social media influencers has become a phenomenon in today's digital media communication. An influencer or social media influencer is a content creator who has expertise in an area and has built a substantial network of people as followers by producing valuable and creative content on social media platforms (Lou and Yuan 2019, Varsamis, 2018).*

social media influencers are often able to exert significant influence over the opinions and behaviours of the audience who look up to them (Bu et al. 2022).

Balakrishnan et al. (2014) investigated the impact of social media marketing on brand loyalty and purchase intention and found that social media marketing, especially electronic word of mouth (WOM), online communities, and online advertising, has positive effects on brand loyalty and purchase intention. Also Gautam and Sharma (2017) emphasized that social media marketing and customer relationships have a significant and positive impact on customers' purchase intentions. In turn, Sousa and Alturas (2020) found that online media is very important for the 'information research' stage of the purchase decision process, with Facebook, YouTube, and Instagram being the social networks with more users and more digital influencers. Balaban and Szabolcs (2022) argue that social media influencers always strive to remain authentic in their interactions with followers and brands, but that promotional activities pose a challenge to their authenticity.

Perceived social media influencers authenticity is a multidimensional construct consisting of sincerity, genuine endorsement, visibility, expertise, and uniqueness (Lee and Eastin, 2021).

Each dimension has varying effects on consumers' evaluation of a social media influencer, willingness to follow a social media influencer, and intention to purchase products recommended by social media influencers.

The main followers' perceptions based on influencers' attributes consist in trustworthiness and perceived expertise. Trustworthiness is related to the credibility of a source or person and the extent to which the source is considered valid (Masuda et al., 2022). Perceived expertise and authenticity are usually accompanied by trustworthiness in predicting positive social media marketing outcomes (Masuda et al. 2022; Chapple, Cownie, 2017; Schouten et al. 2020).

Lastly, purchase intention refers to the behavioral intentions of influencers' followers (Gomes et al. 2021). It is known that the perceived characteristics of influencers, generated from their personal attributes, can generate purchase intentions.

Reading is essential for learning in education. However, the digital revolution has transformed the ways to encourage reading and learning about books.

Bookfluencers are people who talk about books on the web and who they manage, through the contents they create, to guide the choices of other readers, because they generate a community around them that listens and takes their reading recommendations into consideration, thus becoming micro-celebrities (Zaffiro, 2023; Martensen et al., 2022)

¹ University of Modena e Reggio Emilia
e-mail: linda.gabbianelli@unimore.it

Bookfluencers build their reputation starting from their literary interests, communicating them in their social networks, and creating, in many cases, an affective bond with their followers (Onofrei et al. 2020; Jaiswal et al. 2018).

Bookfluencers have evolved in their way of communicating, attracting, and entertaining their followers to the same extent that social platforms and networks have. Booktubers, bookstagrammers, and booktokers are the latest manners of referring to bookfluencers who respectively use YouTube, Instagram, and TikTok to disseminate and promote literary works (Saima, 2020; Dolan et al., 2019).

Concerning the book readers, the data provided by ISTAT, based on the 2023 report, are not very encouraging. In 2022, the percentage of readers is 39.3%. They are mainly young people between 11 and 24 years old who are engaged in reading activities, predominantly female.

As regards the French situation, the percentage of readers is 89% in 2023. Even in France, it is mainly women who are engaged in reading, aged between 15 and 24.

Most importantly, consumers choose to follow influencers because they are 'genuine, open and relatable' (Lee et al., 2021).

Although there are several studies on influencers and the role they play in purchasing processes, the literature regarding bookfluencers is scarce. The work of Magadán-Díaz et al., (2023) conducted in Spain, analyzed the persuasive power of bookfluencers. It emerged that it is bookstagrammers and booktokers who exert the greatest persuasion, while booktubers to a lesser extent, and the main factors involved are the content, the length, the quality of the information, the images, the sound and visual effects and by the voice of the influencer.

Despite the spread of studies about influencer marketing, its application in the book/publishing sector is relatively scarce. Tanwar et al. (2023) stated that the most of studies on influencers have been conducted in United States, Germany, India, Australia, and the Netherlands. In addition, in most of cases studies do not have an industry focus even if the industries most frequently discussed in articles are fashion, beauty and the travel industry. Therefore, from the literature emerges the necessity to explore other industries in unexplored countries in order to deepen the impact of influencers on the perception of digital consumers (Lou, Tan, and Chen 2019).

To fill this gap and gain better understanding of the social media influencers, the study aims at investigating the perception of bookfluencers and their role in the purchasing process by Millennials.

Purpose of the paper. The aim of the study is to investigate the millennials attitude towards influencers in the book/publishing sector. In particular, the paper aims to investigate the cultural differences of gen Z towards answer the following research questions:

1. Which is the perception of bookfluencers by gen y?
2. Which is the influence of bookfluencers in the purchasing process by gen y?
3. Which is the level of engagement of gen y on the bookfluencers activities?

Methodology. The present study aimed to answer the research questions by means of empirical analysis. A structured questionnaire was administered online to a sample of Italian and French millennials (born between 1980-1996). This questionnaire was distributed via computer-assisted web interviewing (CAWI) from September to November 2023.

A total of 601 young consumers completed the questionnaire voluntarily. To create the questionnaire items, the authors drew from the literature on social media influencers (adapted from Zaffiro, 2023; Campbell, Farrel, 2020; Tolstopyat, 2018; Li, Peng, 2021). A five-point Likert scale was used to evaluate the items, except for the socio-demographic items.

The data were processed using SPSS software. Descriptive statistics were performed to summarize the participants' responses and make inferences about the survey data. Additionally, an ANOVA analysis and chi-square test were performed to statistically test the equality of means and to analyze differences in behavior between the Italian millennials and the French millennials.

Results. The table 1 shows the main features of the sample.

The sample is composed mainly by young women that are studying or are employee. Concerning the type of reader, France is a country where the habit of reading is more widespread than in Italy because the percentage of strong readers (people that read at least 12 books per year) is higher.

Table 1 - profile of the sample

Feature		Italy (%)	France (%)
Gender	Women	91%	89%
	Man	9%	9%
	Other	1%	2%
Profession	Student	61.1%	44.7%
	Employee	22.3%	31.9%
	Freelance	6.9%	5%
	Unemployed	2.8%	5.3%
	Worker	1.9%	0.7%
	Teacher	1.3%	3.6%
	Other	1.5%	5.4%
Type of reader	Strong reader	38.6%	51.8%
	Medium reader	34.8%	33.3%
	Weak reader	26.6%	14.9%

Source: our elaboration

Millennials perceive bookfluencers (Table 2) as believable people that provide honest reviews. Influencers are also considered as source of inspiration for the readers. For both France and Italy, promotional hashtags do not negatively impact users' perceptions of bookfluencers (respectively mean 2.37 and 2.10), and users trust their information.

Comparing the perception of the two countries, it emerges that there is a significant difference in terms of credibility (sig.=0.009), identify oneself with influencers (Sig.=0.001) and the honesty of reviews (Sig.=0.000). In particular, Italian millennials have a better perception of influencers respect to French except for the identify themselves with influencers.

Table 2 - Perception of bookfluencers by millennials - comparison between Italy and France

Perception of bookfluencers	ITALY		FRANCE		F	Sign.
	Mean	SD	Mean	SD		
Expertise of influencers	3.54	0.837	3.35	0.860	3.113	0.079

Concerning the *ROLE OF INFLUENCERS IN THE PURCHASING PROCESS* (Table 3), the results show that French millennials are influenced mainly by the author of a book (69.9%), by word of mouth (63%) and by the book cover (58.2%); while Italians from online reviews (57.7%), from the author (52.7%) and from word of mouth (47%). The chi-square test shows that all these factors have a significant difference between the two countries except for the online reviews.

Table 3 - Factors affecting the book purchase - comparison between Italy and France

Factors affecting the book purchase	ITALY	FRANCE	All sample	Chi-square	Sig
Book cover	36.7%	58.2%	47.45%	27.738	0.000
Author	52.7%	69.9%	61.30%	18.554	0.000

Source: our elaboration

For both French and Italian millennials (Table 4), bookfluencers facilitate the search for information and the evaluation of alternatives. Bookfluencers have a considerable impact on purchases: online reviews, in fact, plays a relevant role in the purchase decision.

However, millennials are not inclined to advise a book only because is sponsored by an influencer.

The ANOVA analysis revealed that there are significant differences between Italian and French millennials in terms of ease to find information (sig.=0.005), help to evaluate alternatives (Sig=0.029), intention to buy an editorial product only because is sponsored (sig.=0.001) and the intention to recommend a sponsored book (0.001). Notably, for Italian millennials the role of bookfluencers in the purchasing process is higher than French millennials.

Table 4 - Role of bookfluencers in the purchasing process - comparison between Italy and France

Role of bookfluencers in the purchasing process	ITALY		FRANCE		F	Sign.
	Mean	SD	Mean	SD		
To make easier to find book information	4.11	0.897	3.79	0.956	7.887	0.005
To help to evaluate alternative of choices	3.94	0.906	3.66	1.107	4.829	0.029
Intention to purchase a sponsored book on social media	3.22	1.056	3.00	1.058	2.734	0.099
Intention to buy an editorial product only because is sponsored	2.22	1.219	1.76	1.025	11.024	0.001
Intention to recommend a book just because sponsored	1.82	1.018	1.44	0.755	11.438	0.001

Sig. at level 0.005

Source: our elaboration

The level of engagement of millennials towards the bookfluencers online activity (table 5) is quite different.

As a matter of fact, french millennials are more engaged with bookfluencers, mostly in terms of being part of a community (mean 3.8), liking influencers' content (3.96) and be influenced by the content itself (mean 3.69).

Italian millennials, instead, tend to like influencers' content (mean 3.52), the emotions provoked by the content (mena= 3.20)

In general, both Italians and French millennials limit themselves to being passive spectators by liking posts, especially the latter, with very limited interaction especially for Italy.

The different level of engagement is confirmed by the significant difference emerged from the anova analysis (sig.<0.005), except the emotions that the content arouses.

The passion for reading (85%) is the main reason that pushes the two targets to follow bookfluencers, together with the affinity in terms of reading preferences (70%) and the desire to be updated on editorial news (71%).

The Anova analysis reveal that there is a significant difference between the two countries in terms of passion for reading (Sig.=0.029), the updated on editorial news (sig.=0.000) and the identification themselves with the influencers (Sig.=0.019)

Table 5 - Level of engagement of millennials towards bookfluencers - comparison between Italy and France

Level of engagement of millennials	ITALY		FRANCE		F	Sign.
	Mean	SD	Mean	SD		
Be a member of book communities	2.57	1.568	3.80	1.436	43.268	0.000
Intention to like an influencer's content	3.52	1.131	3.96	1.138	9.489	0.002

Be influenced by the emotions that the content arouses	3.20	1.083	3.37	1.171	1.557	0.213

Sig. at level 0.005

Source: our elaboration

Both samples let themselves be influenced both by the content and by the emotions that it arouses, with greater importance of the content for France, but the presence of the bookfluencer in the posts does not impact the closeness perceived by the users.

Table 6 - Reasons for following bookfluencers - comparison between Italy and France

Reasons for following bookfluencers	ITALY	FRANCE	All sample	Chi -square	Sig
Passion for reading	80.4%	90.1%	85.25%	4.760	0.029
Be informed about editorial news	56.6%	86.8%	71.70%	28.590	0.000

Similar reading preferences	67.8%	73.6%	70.70%	1.031	0.310

Sig. at level 0.005

Source: our elaboration

Research limitations. The study presents some limits, for example it is focused on the millennial's perception, so it could investigate other generational cohorts, or the bookfluencers perception.

Furthermore, it would be interesting to carry out an investigation adopting the perspective of publishers, to see if the collaboration with bookfluencers is fruitful and represent a competitive advantage given the costs to be incurred.

In addition, the study does not investigate the type of content (format) most appreciated by young consumers as well as the sentiment.

Third, the study could expand the observation to other countries and investigate differences and similarities in the role of social media influencers in the book sector.

Managerial implications. The role of social media influencers is becoming increasingly significant in both research and the industry. Influencers enables a unique and faster approach to connecting with audiences that traditional channels may not be able to reach. The social media influencers leverage their influence in a more effective manner with their credibility that can positively impact brand attitude, purchase intention, wishful identification and awareness which consequently leads to improved public relations, product attractiveness and higher engagements (Schouten et al., 2021; Kamaldeep, 2021).

The social media influencers' contents about up-to-date details of the latest products and brands are beneficial as they reduce the effort needed for consumers to search for information (Cheung et al., 2020).

Furthermore, social media influencers can educate consumers and improve the information quality of the content on the use of trending products from various industries by sharing reviews, recommendations, and opinions (Schouten et al., 2021).

From the firm's perspective, in the digital marketing context, developing and maintaining long term partnerships with a selective group of reliable social media influencers is a crucial strategy for success (Wu et al., 2021; McMullan et al., 2022)

The current study highlights the fact that bookfluencers play an important role in the purchasing process of millennials both in Italy and in France. Consequently, bookfluencers can be considered a precious resource for publishers that want to increase their visibility, increase brand awareness towards of the publishing sector and, ultimately, increase sales.

From a cultural point of view, bookfluencers play a key role for the younger generations and beyond, as they are able to bring back into vogue a declining activity, that of reading, which is fundamental for broadening one's horizons, enrich one's cultural background, develop a critical spirit, improve language skills and, more simply, to escape from everyday life.

Originality of the paper. The study has different aspects of originality:

First of all, the social media influencer marketing has been applied to numerous context (tourism, fashion, beauty) but there are not studies concerning the book sector. Secondly, the study is focused on the young consumers, that is Millennials. Third, the context investigated as there aren't previous studies conducted both in Italy and in France.

Lastly, the intercultural perspective of the analysis in which the role of social media influencers is investigated.

The effectiveness of communicating food security in Agri-food firms: an exploratory study from the entrepreneurial perspective

EMANUELA CONTI¹ DANIELE GIAMPAOLI² FRANCESCA CESARONI³ TONINO PENCARELLI⁴

Abstract

This study aims to understand how Italian firms in the agri-food sector communicate food safety and how communication impacts business performance. This piece of research is a “work-in-progress” and it is part of a wider research on food security.

A survey was conducted on micro and small agri-food firms and a sample of 149 firms was selected. SEM was performed to understand how these communication tools relate to business performance. We found that both traditional and digital communication tools positively and significantly impact communication performance. However, traditional communication seems to be much more effective.

Keywords: *traditional communication; digital communication; business performance; Agri-food; micro and small firms.*

Framing of the research. *In this study, we adopted this definition of food security: “the condition of the foodstuffs in all stages of production, processing, and distribution, required to guarantee the protection of consumer’s health, also taking into account normal circumstances of use and information available for the foodstuffs concerned” (Baert et al., 2011). In short, food can be considered safe if it is the result of a combination of primary healthy and controlled resources, with no risk to consumer health.*

Food security is a wide concept that includes not only the compulsory “food security” but is strictly related to well-being and environmental sustainability. Safe food contributes to improving the well-being of individuals and societies and good quality raw materials to manufacture food products contribute to the preservation of soil and climate.

However, the literature on well-being is almost always separated from the literature on environmental sustainability (Roberts et al., 2015) and social sustainability. These two streams of research could be further enriched if they were integrated, taking a more holistic perspective on well-being and an increased awareness of the limits of individual well-being pursuits (Kjell, 2011).

Hence, this study contributes to filling this research gap by adopting a wide definition of food safety, integrating well-being and sustainability.

Consumers are increasingly interested in food safety (Baert et al., 2011) and agri-food companies should improve communication effectiveness to reduce perceived risks (Santeramo & Lamonaca., 2021) and maintain companies’ competitiveness.

Content is a key element of marketing communication, especially in the online environment. Consumers look for useful and interesting content for their needs, interests and expectations. Firms are asked to disseminate content in all communication tools. Content marketing consists of the creation, dissemination and sharing of relevant, interesting and timely content to engage clients in all touch points of the customer journey, with the final scope of conversion (Holliman and Rowley, 2014).

The literature on the communication of agri-food firms is heterogeneous and fragmented as it investigates specific communication tools (website, social network, influencer, etc.) and on specific sectors such as wine, cheese, honey, etc. (Dolan and Goodman, 2017; Ingrassia et al., 2020). More specifically, empirical studies on food safety communication are still rare and those adopting a broad perspective are even more scarce (Conti et al., 2023).

A recent study by Conti et al. (2023) has examined the impact of traditional and digital communication on sales and customer loyalty of SME agri-food firms, adopting the Dynamic Capabilities theory, interpreted as an extension of the RBV theory and suggesting that resources and capabilities interact in determining firm performance outcomes (Henderson and Cockburn, 1996; Teece et al., 1997). They found that corporate websites impact positively both

engagement and sales, while corporate websites, traditional advertising, PR impact positively sales.

This study takes a marketing perspective and considers marketing resources as the assets available to marketers and others within the organization that – when transformed by the firm’s marketing capabilities – can create valuable outputs (Morgan, 2011). Communication resources and capabilities are considered key marketing capabilities associated with customer value delivery (McKee et al., 1992).

Hence, there is space to understand if these tools allow them to communicate effectively. In particular, this study aims to understand how they impact communication performance, operationalized through brand awareness, customer engagement, lead generation, and sales items. It builds on the theoretical framework of Dynamic Capabilities theory and the studies in marketing literature pointing out the positive impact of effective communication tools on performance.

We assume that effective marketing communication is an important factor in maintaining business success also in the Agri-food sector and that it is crucial to combine digital and traditional communication to be successful. Traditional communication tools include advertising that can be done through print papers such as newspapers, brochures, and magazines, audio media such as radio, and visual media such as billboards and television (Kotler and Armstrong, 2010) and PR (Invernizzi and Romenti, 2020). Main digital communication tools are corporate websites, social networks, and email (Gregori and Pascucci, 2019; Tuten and Solomon, 2018).

Through effective content creation and dissemination, firms can enhance brand awareness, customer engagement, lead generation, and loyalty (Hollebeck and Macky, 2019).

Brand awareness is the first goal of communication, in the pre-purchase phase of the customer journey. Effective communication in this phase contributes to increasing brand awareness (Kim et al, 2003; Aaker, 2010; Sawant, 2012; Ateke and Nwulu, 2017).

With the emergence of social media, customer engagement has become an important goal for reaching superior brand performance (Barger et al., 2016; Oviedo-García et al., 2014). Furthermore, perceived brand interactivity (Gligor et al., 2019b) and satisfaction with the brand (Pansari and Kumar, 2017) positively impact customer engagement. Effective communication is essential for successful lead generation (Poeyry et al., 2017) and sales increase (David et al., 1988; Gregori and Pascucci, 2019).

Purpose of the paper. The purpose of the study was to analyze the impact that traditional communication (COMT) and digital communication (COMD) have on communication performance (PERFC). The research question was the following: How much does corporate communication, integrated with the principles and practices of sustainability and food safety, improve the company’s performance?

We hypothesized that:

H1: There is a positive direct relationship between COMT and PERFC;

H2: There is a positive direct relationship between COMD and PERFC.

Figure 1: Research model

Methodology. We collected survey data from January to February 2021 from Italian SMEs. We selected a sub-sample made of 149 micro and small firms, from the representative sample of 900 SMEs from the AIDA database. Our sub-sample uses the following search criteria: number of employees between 1 and 49 available financial statements, active businesses, with available telephone contacts, operating in sectors identified by the ATECO codes 10 - Food industries and 11 - Beverage industries.

Out of 900 firms, 149 took part in the research, representing about 7%. No questionnaires were excluded because they were all filled in. Approximately 54% of the firms employed up to 9 employees while the remaining 46% between 10 and 49 employees.

The questionnaire was administered using two methods: CAWI (Computer Assisted Web Interviewing) and CATI (Computer Assisted Telephone Interviewing). The companies that participated through the CAWI method were 139 (93.2%), while those that participated through the CATI method were 10 (6.8%).

The research model includes three first-order constructs. Measurement scales for COMT were taken or adapted from (Kotler and Armstrong, 2010; Invernizzi and Romenti, 2020). Scales for COMD were taken or adapted from previous work of (Gregori and Pascucci, 2019; Tuten and Solomon, 2018) Finally, PERFC scale was taken from (Barger et al., 2016; Gligor et al., 2019b; Pansari and Kumar, 2017; Poeyry et al., 2017; David et al., 1988)

Measurement scales include the following items:

- COMT: Traditional communication (impersonal communication, such as brochures, advertising in magazines, etc.) personal communication (internal staff and external collaborators) and social or environmental sustainability report.
- COMD: Digital communication (corporate website, social network, email, etc.)
- PERFC: Performance of communication on awareness, engagement, lead generation, and sales.

Results. Internal consistency reliability, convergent validity and divergent validity

We assessed the psychometric properties of scales in terms of reliability, convergent validity and discriminant validity. For reliability test we used Cronbach's Alpha ($\alpha \geq 0.7$) and Dillon-Goldstein's rho ($\rho \geq 0.7$) (Hair et al, 2010). As shown in Table 1 measurement scales have adequate convergent validity (Hair et al, 2010). We assess discriminant validity using both Heterotrait-Monotrait Ratio (Table 2) (Henseler et al., 2015) and Fornell-Larcker criterion (Table 3). No value is above the recommended threshold and discriminant validity is assured.

Table 1: Reliability and convergent validity

Reliability and convergent validity					
Inherent variables	Items	Loadings	Cronbach's alpha	Dillon-Goldstein rho	AVE
COMD			0.775	0.785	0.686
	COMD1	0.818			
	COMD2	0.844			
	COMD3	0.824			
COMT			0.720	0.728	0.640
	COMT1	0.822			
	COMT2	0.802			
	COMT3	0.775			
PERFC			0.921	0.926	0.809
	PERFC1	0.886			
	PERFC2	0.874			
	PERFC3	0.931			
	PERFC4	0.905

HTMT			
	COMD	COMT	PERFC
COMD			
COMT	0.883		
PERFC	0.613	0.758	

Table 3: Fornell-Larcker criterion

Fornell-Larcker			
	COMD	COMT	PERFC
COMD	0.828		
COMT	0.667	0.800	
PERFC	0.532	0.626	0.899

Testing of hypothesis

Data were analyzed using PLS-SEM and SmartPLS software (4.1.0.0) (Ringle et al., 2022)

PLS is a structural equation modeling technique widely used in the marketing and management field. It requires a sample size ten times the number of indicators associated with the most complex construct (four in this study) or the largest number of antecedent constructs linking to an endogenous construct (two: COMT, COMD) (Hair et al, 2010). Therefore, the present research model would have been valid with 40 responses. Figure 2 shows the results of the structural model.

Figure 2 – Results of the structural model

Table 4: Results of the structural model

Hypothesis	Path	Path coefficient	T-value	P-value	Status
H1	COMD -> PERFC	0.205	2.651	0.008	Supported
H2	COMT -> PERFC	0.489	6.417	0.000	Supported

Table 5: Effect size

	f ²
	PERFC
COMD	0.040
COMT	0.228

Discussion and Conclusion

The goal of the present paper is to empirically test the impact that traditional and digital communication tools have on communication performance.

We tested our hypotheses on a sample of 149 Italian SMEs using PLS-SEM and found good parameters for all latent variables.

As shown in Table 4 both hypotheses are supported confirming the theoretical assumption and empirical results.

Table 5 shows the effect size f^2 , that is the change in the value of R^2 when an exogenous construct is omitted, and it is used to understand whether its impact on the dependent variable is substantial or not. Values of 0.02, 0.15, and 0.35 represent small, medium, and large effects, respectively (Hair et al., 2010). As evident from Table 5, the most substantial impact on the PERFC variable is exerted by COMT, confirming that traditional communication tools have a stronger impact on PERFC.

As the sample is made of half of the micro firms and the other half of small firms, most probably entrepreneurs invest more in traditional communication tools for disseminating information about food safety such as personal communication, advertising, environmental reports, or PR such as participation in sector fairs.

Conversely, the adoption of new digital communication tools is still very low, thus confirming the results of previous studies conducted in the agri-food sector. The results of this empirical study show that probably entrepreneurs of small firms lack the digital culture and financial resources that characterize many small businesses.

Research limitations. We created and empirically tested a structural model on a sample of 149 Italian SMEs. We found that both traditional and digital communication have a significant direct impact on communication performance. This study's main limitation concerns its focus on a single European country. The research is a work in progress.

Managerial implications. The research results suggest entrepreneurs in this sector to invest in effective communication as it impacts positively and significantly on communication performance, especially in traditional communication. European and national policymakers should support micro and small firms with marketing training and the recruitment of young personnel with digital marketing skills.

Future research should investigate a larger sample of firms, and identify how each communication tool impacts

communication goals and qualitative research is also required. In particular, it could be interesting to identify best practices for effective communication in the Agri-food sector.

Originality of the paper. This is the first study, to our knowledge, that empirically investigates the relationships between communication of food security and communication performance in the Agri-food sector.

Leveraging Italianness abroad: A corpus-assisted discourse approach to restaurant branding

WALTER SPEZZANO¹ STEFANO DE CANTIS² JOHN D. BUSCHMAN³

Abstract

Brands are carriers of meanings, shaping consumers' perceptions while influencing their behavior through discourse. This study examines restaurant branding from a discourse perspective, specifically focusing on Italian restaurants in Miami-Dade County, Florida, United States. Through a corpus-assisted discourse approach (CADS), the study investigates the use of the "Italianness" tactic in these restaurants' digital brand positioning strategy. Findings reveal that restaurants employing this tactic create highly humanized brands, conveying values such as authenticity, tradition, and high-quality ingredients, among others. This study aims to contribute to existing research at the intersection of branding and discourse while raising awareness among hospitality professionals about the impact that a discourse-based brand strategy and the semiotic power of food on consumer behavior.

Keywords: *hospitality; strategic communication; marketing; digital branding; digital discourse; CADS*

Framing of the research. *Contemporary society is deeply influenced by brands, as they shape cultural, economic, and social practices (Schroeder, 2009). Branding involves and is grounded in discourse (Fitchett & Caruana, 2015), defined by Fairclough (2015) as "a way of construing aspects of the world associated with a particular social perspective" (p. 87). Companies rely on discourse to communicate with the world at large, both internally (e.g., with employees) and externally (e.g., with consumers) (Breeze, 2013). From a marketing perspective, discourse is crucial in brand positioning, described by Keller & Swaminathan (2020) as "the heart of marketing strategy" (p. 47). Effective brand positioning entails understanding the target consumers and recognizing key competitors to find the proper location both in the minds of consumers and in the market, making the brand positively identified and differentiated.*

In today's digital world, companies rely on corporate websites to establish their online presence on the Web, influence their audiences, and mediate meanings. Just as physical stores utilize display windows and store design to influence consumer perceptions, so in cyberspace, website visitors form their image of the brand based on the content, design, and organization of the website (Breeze, 2013). Despite today's widespread use of social media, official websites are still regarded as the most important and reliable communication channels for marketing, playing a key role in brand positioning and the subsequent brand image formation, thus influencing consumer behavior (Hallett & Kaplan-Weinger, 2010; Wu, 2018; Yu et al., 2023). More specifically, the "about us" webpage of a corporate website is a pivotal tool for brand positioning (Breeze, 2013), as it is the specific website section where companies disseminate their brand identity. Notably, with advancements in technology, the "about us" content may be found either in its dedicated section of the website, directly embedded in the homepage, or in both locations simultaneously.

In the context of the restaurant business, which is the focus of this paper, digital discourse on restaurant websites includes a food storytelling based on the rhetoric between a specific culture and its culinary rituals (Burton, 2016), which is at the core of restaurant branding. This discourse shapes, in the minds of consumers, positive images of the restaurant products/services, as well as of the restaurant as a company. Consumers are more willing to choose well-known brands with positive attributes, which consequently are perceived as commitments to quality (Dabeva, 2012).

A significant segment of the food and beverage industry worldwide is represented by Italian cuisine. The current globalization processes and Italians' migratory movements have contributed to the global spread of Italian cuisine, as witnessed by the Italian restaurants distributed all over the world (Giampiccoli, 2017). The "Made in Italy" brand evokes attributes in the minds of consumers that positively characterize the perception of Italian products and the image of Italy (Cappelli et al., 2017; Temperini et al., 2016). The relationship between Italy and food is a symbiotic and culturally deep bond; Italy's intricate and illustrious culinary heritage has not only played an integral role in shaping the nation's cultural identity, but it has also left an indelible mark on the global food and beverage landscape. Rooted in centuries of history and regional diversity, Italian cuisine is a fundamental trait of Italianness (Bandini & Corduas, 2019).

³ Chaplin School of Hospitality & Tourism Management, Florida International University, United States
email: jbuschma@fiu.edu

Discourse investigations of Italianness in the food and beverage industry remain relatively limited. Federici & Bernardelli (2016) carried out a cultural analysis of food discourse in advertising, focusing on how Italian food products are promoted to U.S. consumers and how Italian sounding products are presented in this context. The work edited by Naccarato et al. (2017) examined how representations of Italian food and foodways shape specific ideologies about Italy and Italian culture across different media. Corrizzato (2018) analyzed the promotional representation of made-in-Italy products, focusing on the official websites of Italian wineries. Guzzo & Gallo (2019) investigated Italianness in migration contexts and corporate discourse in food-related practices by analyzing Anglo-Italian food and beverage business managers' replies to negative online reviews. Nichele (2019) and Bandini & Corduas (2019) explored consumer perceptions of Italian restaurants abroad and the image of Italianness held by consumers.

More recent studies have focused on celebrity chefs' food discourse, considering that "chefs have achieved the popularity and status of superstars, as perhaps only pop music singers and actors had in the past" (Rossato, 2022, p. 11). In this regard, Rossolatos (2020) examined how Italy's place brand and Italianness are discursively articulated, (dis)placed, and appropriated in British celebrity chef Jamie Oliver's travelogues. Irimiás & Volo (2022) scrutinized Italian celebrity chef Massimo Bottura's online food discourse, with respect to pro-environmental behavior. Rossato (2022) conducted a cross-cultural diachronic study of food television discourse, focusing on the discursive evolution of mainly British and Italian television cookery programs. Despite the significant relationship between discourse and branding, research within this framework, specifically focusing on Italian restaurants abroad, is still scarce. As little attention has been dedicated to the analysis of the digital brand positioning strategy of Italian restaurants abroad and their use of digital discourse, the present work aims to contribute to filling this gap by focusing on Italian restaurants in Miami-Dade County, Florida, United States (hereafter Miami).

Florida has emerged as a prominent culinary destination, boasting a vibrant and diverse food and beverage scene. Its official destination marketing organization (DMO), Visit Florida, has engaged in marketing efforts with partner DMOs in the state, along with the prestigious Michelin Guide, to collectively promote Florida as a world-renowned culinary destination (Michelin North America, 2021; Visit Florida, 2023). Florida's food and beverage landscape is particularly vibrant in Miami, which has been granted the title of "2023 Food City of the Year" by the esteemed food and beverage publication *Bon Appétit* (Greater Miami Convention & Visitors Bureau, 2023). Miami indeed offers a unique fusion of flavors and culinary traditions that captivate both residents and visitors alike. Italian restaurants in Miami are a significant segment of its food and beverage industry: in February 2024, TripAdvisor recorded the presence of 430 restaurants offering Italian cuisine in Miami out of a total of 6,077 establishments.

Purpose of the paper. This paper is part of a wider ongoing research project, aiming to explore digital branding in hospitality and tourism from a discourse perspective. The project involves collaboration among the University of Palermo (Italy), Florida International University (United States), and Greater Miami Convention & Visitors Bureau (United States).

The purpose of this study is to investigate digital branding in the context of Italian restaurants abroad. Specifically, by focusing on Italian restaurants in Miami, the study examines the use of the Italianness tactic (i.e., emphasizing the Italian brand identity) in the restaurants' strategy of digital brand positioning. The digital discourse used by the restaurants on their corporate websites is analyzed through a corpus-assisted discourse approach.

Methodology. The methodological framework at the core of this paper is Corpus-Assisted Discourse Studies (CADS) (Baker, 2023; Partington et al., 2013), which draws upon the triangulation of Corpus Linguistics (CL) (Brezina, 2018; McEnery & Hardie, 2011) and Critical Discourse Studies (CDS) (Wodak & Meyer, 2015). In CADS research, statistical techniques and software tools are utilized for the collection and analysis of corpora (i.e., large electronic sets of textual data), while adopting a critical stance for a more in-depth analysis of textual data embedded in their co-text and social context. On the one hand, CL provides objective results that reduce the researcher bias. Indeed, "an association between two words, occurring repetitively in naturally occurring language, is much better evidence for an underlying hegemonic discourse which is made explicit through the word pairing than a single case" (Baker, 2023, p. 16). On the other hand, CDS "incorporates critical thoughts into their meaning construction and examines texts together with a broad social context" (Qian et al., 2018, p. 527). Both the computational and the human-led investigations of data are pivotal in CADS research.

In February 2024, Italian restaurants in Miami were surveyed on TripAdvisor, resulting in a population of 430 Italian restaurants out of a total of 6,077 restaurants in Miami. For the purpose of this paper, the label "Italian restaurants" specifically refers to those classified as Italian by TripAdvisor because they offer Italian cuisine. From this initial population of 430 Italian restaurants, a systematic sampling approach yielded a sample of 215. However, 78 restaurants were excluded from the sample due to the unavailability of their corporate websites, resulting in a final sample size of 137 restaurants. Each restaurant's website was meticulously examined by focusing on its homepage and "about us" webpage. This process identified the restaurants employing the Italianness tactic within their digital brand positioning strategy and those which do not employ the tactic. Furthermore, close reading and manual data extraction guaranteed the collection of specific textual data related to the "about us" content and the food storytelling. The textual data extracted from each website were compiled into individual text files, resulting in a one-to-one correspondence between the websites and the text files. Two corpora, whose features are displayed in Table 1, were created by means of #LancsBox (Brezina et al., 2021). The same software was used to analyze the corpora.

Table 1 Corpora features

Corpus	Restaurants	Files	Tokens	Types
corpus_a	Italian restaurants employing the Italianness tactic	91	31,704	5,042
corpus_b	Italian restaurants not employing the Italianness tactic	46	8,928	2,387

A keyword analysis was conducted to investigate the use of the Italianness tactic in the digital brand positioning strategy of the restaurants included in corpus_a. Keyword analysis involves comparing a corpus of interest against a baseline reference corpus, by using a statistical measure, to identify words that occur either more frequently (i.e., positive keywords) or less frequently (i.e., negative keywords) in the corpus of interest when compared to the reference corpus. Corpus_a was chosen as the corpus of interest and corpus_b as the reference corpus, while Cohen's *d* was utilized as the comparison statistic to measure keyness. A threshold of $s \geq 0.35$ was set, considering the standard interpretation of this effect size measure (Cohen, 1988), which is reported in Table 2. Setting a threshold of $s \geq 0.35$ indicates a focus on identifying keywords with a moderate or higher effect size, which implies a substantial difference in occurrence between the two corpora. In other words, this choice produced keywords that demonstrate a noticeable difference in language usage between corpus_a and corpus_b. Additionally, absolute frequency and the coefficient of variation were utilized to analyze keyword frequency and dispersion, respectively. Both positive and negative keywords were further investigated through concordance analysis, which involves the investigation of keywords embedded in their co-text. Out of the 63 positive keywords identified, 5 were omitted due to lacking semantic relevance. Similarly, out of the 38 negative keywords, 7 were excluded from the analysis. Subsequently, both positive and negative keywords were classified by discourse category, semantically grouped by topic, and analyzed in relation to their social context.

Table 2 Cohen's *d*: Standard interpretation of effect size

Effect	Cohen's <i>d</i>
Small	0.2
Medium	0.5
Large	0.8

Results. The positive keywords identified in the analysis reveal how restaurants in corpus_a employ the Italianness tactic in their digital brand positioning strategy. Conversely, negative keywords, occurring less frequently in corpus_a but more frequently in corpus_b, are particularly useful for contrasting the two corpora. The analysis revealed keywords belonging to four discourse categories: corporate, food, ideological, and persuasive discourse. Table 3 below shows the keywords characterizing the corporate discourse of Italian restaurants in Miami. In corpus_a, emphasis is placed on the commitment of restaurant staff, highlighting qualities such as cure, passion, dedication, and professionalism. Furthermore, restaurants employing the Italianness tactic often share a history rooted in the migration of past generations from Italy to the United States, often stressing their status as family businesses. In contrast, corpus_b addresses corporate social responsibility (CSR) issues and emphasizes customer benefits, such as time and cost efficiency. Both corpora share keywords related to corporate mission and establishment type. In corpus_a, the corporate mission focuses on addressing customer needs and providing support, while in corpus_b, it emphasizes ensuring customer satisfaction. Keywords defining the types of establishment include "trattoria" in corpus_a and "bar" in corpus_b. The former suggests the idea of a small restaurant serving traditional, home-style dishes, while the latter indicates a potential focus on beverages and lighter food offerings.

Table 3 Keywords of corporate discourse

bar	establishment	-0.36	18.00	3.05	19.00	-2.56

The keywords related to food discourse are presented in Table 4. Both corpora contain keywords pertaining to food types, restaurant location, and restaurant offerings. Typical Italian foods such as “pasta” and “desserts” are prominent in corpus_a, while typical American foods like “burger” and “fries” characterize corpus_b. Interestingly, the keyword “pizza” is not among the positive keywords in corpus_a, despite its cultural association with Italian cuisine. A collocation analysis could provide further insights into its discursive use. Within the topic of food types, the keyword “white” is used to qualify specific foods, such as wines, truffle, and onion.

Concerning location, corpus_a emphasizes an elegant experience, while corpus_b focuses on the lounge area, aligning with the idea conveyed by the keyword “bar” in corporate discourse. Both corpora highlight the dining experience in the open-air areas of the restaurants, as the keywords “outside” and “outdoor” indicate.

With regard to the restaurant offerings, the keyword “list” refers to the list of wines offered by the restaurants. The keyword “event” indicates that restaurants in corpus_a position a niche-oriented brand, offering specific types of events (e.g., artistic, philanthropic, sportive, private, etc.). In contrast, the keywords “breakfast” and “power” (the latter referring to power business lunches) suggest that restaurants in corpus_b focus on practical and everyday dining options to cater a broader audience, including business professionals among others.

Additionally, while corpus_b features dietary options as a key element, corpus_a relies on the narrative of food preparation, which enhance customer trust and loyalty, increase perceived value and quality, educates customers about culinary techniques and ingredients, and creates emotional connection by humanizing the brand.

Table 4 Keywords of food discourse

Keyword	Topic	Cohen's d	Frequency corpus_a	Dispersion corpus_a	Frequency corpus_b	Dispersion corpus_b
desserts	food type	0.53	21.00	2.37	1.00	6.71

...
pizza	food type	-0.33	209.00	1.89	76.00	-1.67

Table 5 below displays the keywords pertaining to ideological discourse. In corpus_a, a set of cultural values integral to Italianness is evident, defining Italian cuisine and recipes as authentic and traditional, and emphasizing the value of sharing the dining experience with friends and family. Conversely, corpus_b does not exhibit keywords conveying cultural values. Both corpora share topics related to the origin and quality of food ingredients and products, although in an unbalanced manner (i.e., 11 keywords in corpus_a and only 2 keywords in corpus_b). In corpus_a, ingredients and products are imported from Italy, with an emphasis on the regional dimension of Italian cuisine, particularly from the South. On the other hand, corpus_b features local ingredients and products. Additionally, restaurants in corpus_a highlight the high quality of their imported ingredients and products, while those in corpus_b emphasize that theirs are not frozen.

Table 5 Keywords of ideological discourse

Keyword	Topic	Cohen's d	Frequency corpus_a	Dispersion corpus_a	Frequency corpus_b	Dispersion corpus_b
italian	origin	1.26	409.00	0.87	17.00	2.21
italy	origin	1.10	96.00	1.26	1.00	6.71

selected	quality	0.37	7.00	3.84	0.00	0.00
...
frozen	quality	-0.36	1.00	9.49	5.00	-3.79
local	origin	-0.35	29.00	2.94	17.00	-2.25

The keywords of persuasive discourse are listed in Table 6 and categorized by rhetorical techniques. The following rhetorical devices were identified by Dann (1996) in his investigation of promotional discourse in tourism settings: euphoria, testimony, comparison, languaging, and ego-targeting. Ethos was deeply explored by Breeze (2013), while call to action is typical of the AIDA model (Lewis, 1899, as cited in Manca, 2016; Strong, 1925). Both corpora share euphoria, comparison, and call to action. Euphoria is a property of promotional discourse, involving the use of positive and glowing terms to create a positive frame of what is promoted (e.g., “acclaimed” and “celebrated” in corpus_a; “delicious” and “refreshing” in corpus_b). Comparison uses metaphors and similes to create vivid mental images and evoke emotional connections (e.g., “feed both your appetite and soul” in corpus_a; “just like my Grandma used to cook” in corpus_b). Call to action employs imperatives, whose pragmatic function is not that of giving orders but to encourage consumers to participate in a specific brand experience (e.g., “join us in celebrating Italian cuisine in Miami” in corpus_a; “try some of the local top dishes” in corpus_b). Restaurants in corpus_a position themselves as part of a collective, with prominent figures such as founders and chefs taking center stage. This technique strengthens the corporate ethos (Breeze, 2013) and enhances credibility. Consumers often perceive a group entity as more established and trustworthy compared to an individual one. Additionally, restaurants in corpus_a leverage external validation to bolster a positive image by employing the testimony technique. They showcase, on their websites, the positive reviews written by customers on social media, as showed by keywords reflecting the sentiments of satisfied customers. Furthermore, the rhetorical technique of languaging is evident in corpus_a, utilizing foreign (i.e., Italian) words to evoke exotic qualities associated with products or dishes. A rhetorical technique characterizing corpus_b is ego-targeting, aimed at enhancing audience engagement through direct forms of address.

Table 6 Keywords of persuasive discourse

Keyword	Technique	Cohen's d	Frequency corpus_a	Dispersion corpus_a	Frequency corpus_b	Dispersion corpus_b
group	ethos	0.46	22.00	2.84	1.00	6.71

top	euphoria	-0.36	19.00	3.07	12.00	-2.45
your	ego-targeting	-0.38	139.00	1.52	56.00	-1.31
you'll	ego-targeting	-0.35	2.00	7.05	5.00	-3.88
like	comparison	-0.36	31.00	3.45	22.00	-2.19

In conclusion, the analysis reveals significant insights into the digital brand positioning strategy of Italian restaurants in Miami. The Italianness tactic shows four different discourse categories, which emphasize Italian values in corporate, food, and ideological contexts, while relying on specific rhetorical techniques. The restaurants employing the Italianness tactic position strongly humanized brands, conveying values such as authenticity, tradition, and high-quality ingredients.

Research limitations. One limitation of the paper is that it solely focuses on data extracted from corporate websites. This narrow focus may overlook valuable insights that could be gained from other sources, such as social media. A more comprehensive approach incorporating diverse data sources could provide a richer understanding of restaurant branding practices. Moreover, the paper focuses particularly on Italian restaurants in Miami, which may not represent the economic and cultural conditions of other food and beverage businesses and locations.

Another limitation arises concerning the nature of the data since the analysis relies exclusively on textual data. A multimodal analysis of the discourse employed online by Italian restaurants abroad would undoubtedly yield more insightful and accurate findings about their branding practices.

Managerial implications. Overall, the paper informs businesses, particularly Italian restaurants abroad, about the pivotal role of discourse in shaping a positive brand image online.

The work highlights the importance of corporate websites as crucial digital platforms to increase customer loyalty and differentiation in a competitive market. By paying attention to the content, design, and organization of their websites, with a special focus on the “about us” section, restaurants can create a strong online presence and positively influence consumer perceptions. The four identified discourse categories suggest that restaurants can leverage storytelling and narrative techniques to strategically communicate their brand messages. Additionally, by considering the cultural and social dimensions of food, restaurants can tailor their brand strategies with specific culture-based tactics to better engage with their target audiences and create meaningful connections.

Originality of the paper. The paper is strongly interdisciplinary, both theoretically and methodologically, encompassing the disciplines of Management and Organization Studies, Statistics, and Linguistics. By focusing on the

role of discourse in branding practices, the work highlights an original framework to investigate strategic communication. The originality of the paper lies, above all, in its methodology, especially in its application in business contexts. As a matter of fact, the uptake of CADS within the field has not been particularly fervent. Instead, the literature shows an abundance of works relying on exclusively-quantitative forms of textual analysis, which present some significant limitations (Gillings et al., 2024). On the one hand, they often overlook how language shapes perceptions of the world, ignoring issues of meaning. On the other hand, they assume that words operate independently from their co-text and social context, whereas CADS considers these factors as crucial to understand the construction of meaning through language. CADS facilitates both a broad overview of the entire corpus and a detailed examination of subtle linguistic nuances, thus allowing the transition between a macroscopic and microscopic analysis of the data within the same interface. Throughout the investigation, continuous access to the complete documents within the corpus is maintained, using software tools that are relatively user-friendly in terms of IT proficiency required for their use. The application of this methodology in business contexts can be particularly insightful for strategic communication research and practice.

Strategic Agility in Error Management: Bridging Theory and Practice in Strategic Communication

MARCO BALZANO¹

Abstract

Errors put firms' capabilities to critical tests. The present research delves into the role of strategic agility in the pursuit of effective error management strategies. By integrating strategic agility and error management literature, the analysis illuminates on how resource fluidity, leadership unity and strategic sensitivity are key in each phase of error management strategies, encompassing error detection, error communication, and damage control. Through a historical analysis, the present study examines the Samsung's strategic moves post the Galaxy Note 7 malfunctions reported by various consumers in August 2016. The study reveals that the three core components of strategic agility indeed facilitated the Samsung's recovery from the initial error. The findings extend strategic agility discourse beyond prompt adjustments to the external environment, highlighting its potential in proactive internal error management. Framing strategic agility as a response mechanism to an internal error, this study underscores the necessity of cultivating the three capabilities associated with strategic agility to be prepared to effectively cope with an error, offering a novel perspective on how to firms can deal with an error and how to navigate crisis periods sometime activated by such an error. In this perspective, the present study sheds lights on the nexus between theory and practice in strategic communication, providing insights on how strategic agility can foster an organizational culture that openly cope with an error through tailored actions and consistent communication strategies.

Key words: error management; strategic agility; strategic communication; error detection; error communication; damage control.

Framing of the research. *This research is situated at the intersection of error management and strategic agility literature. Error management literature suggests that the way organizations perceive, handle, and learn from an error is crucial to their adaptability and performance (Akgün et al., 2022; Lei and Naveh, 2023). Central to this debate is the idea that an error, while sometimes inevitable (and sometimes not even promptly recognized as such), can be managed, and possibly open valuable learning opportunities (Frese and Keith, 2015; Van Dyck et al., 2005).*

As error management scholars identified, there exist three main phases characterizing an effective error management strategy: error detection, error communication, and damage control (Frese and Keith, 2015; Lei and Naveh, 2023). Specifically, once an error occurred, error detection is the first phase in the error management process. This phase is critical as an undetected error cannot be corrected or learned from. Effective error detection mechanisms include monitoring systems, regular audits, and a culture that encourages reporting without fear of punitive consequences. The literature emphasizes the importance of creating an organizational climate that supports vigilance and openness, facilitating the early detection of an error (Edmondson, 1999; Tucker and Edmondson, 2003).

After that an error is detected, the next phase is error communication, which involves the dissemination of information about the error to relevant stakeholders of the organization. Effective communication ensures that the error is understood and that corrective actions can be taken. This requires clear channels of communication and a culture that values transparency over blame. Research highlights the role of psychological safety in promoting open dialogue about an error, enabling teams to address and resolve issues more effectively (Edmondson, 2004).

Damage control includes the actions taken to mitigate the negative consequences of an error. In this phase, firms undertake immediate corrective actions to rectify the identified error and prevent its reiteration. Damage control often involve analyzing the root causes of an error, implementing changes to processes or systems, and providing training or resources to avoid similar errors in the future. In this perspective, the literature underscores the importance of resilience and adaptability in this phase, as organizations must quickly adjust to correct an error and minimize its impact (Desjardine et al., 2019; Weick and Sutcliffe, 2007).

From a holistic management perspective, it is evident that firms entering error management strategies should be equipped with multiple capabilities to effectively cope with an error. For example, during the error detection phase, firms should be capable to rapidly address possible stakeholder concerns, to reallocate resource functionally, and to deliver consistent messages to their audience, indicating a shared concern for an incurred error. As well, management should

¹ University of Ca' Foscari Venezia
e-mail: marco.balzano@unive.it

prove internal cohesiveness during the other two phases of error management strategies, while remaining sensitive toward the issue, for example regularly updating them on the error management progresses. Moreover, beyond inspecting the nature of the error, which can thus require resource mobilization, resource demanding activities for supporting key stakeholders and internally reconfigure may be necessary.

Consistently, the present study argues that firms willing to effectively cope with an incurred error should possess the three capabilities related to strategic agility. Strategic agility is increasingly recognized as a central tool for firms operating in dynamic and uncertain environments (Doz, 2020; Doz and Kosonen, 2008). This concept encompasses a firm's capacity to swiftly adapt, pivot, or realign its strategic directions and operational processes in response to emerging challenges and opportunities (Doz and Kosonen, 2008; 2010). Strategic agility necessitates the activation of response mechanisms to changes in external business landscape, coupled with an internal capability to enact change efficiently and effectively. The literature conceptualized strategic agility around three meta-capabilities: strategic sensitivity, leadership unity, and resource fluidity (Doz and Kosonen, 2010; Fourné et al., 2014; Tarba et al., 2023; Weber and Tarba, 2014). Each of these capabilities plays a critical role in enabling a firm to navigate the complexities of a rapidly evolving business landscape.

Strategic sensitivity involves a firm's ability to perceive and interpret a situation with acuteness and accuracy (Doz, 2020; Tarba et al., 2023). This capability requires a robust process of continuous sense-making, where strategic insights are gleaned in real-time and used to inform decision-making. The development of strategic sensitivity hinges on fostering a prompt and fresh mindset within the organization, encouraging broad participation in the strategy process to leverage diverse perspectives. Leadership unity refers to the capacity of leadership to make rapid and cohesive decisions (Doz and Kosonen, 2010; Morton et al., 2018). This unity is crucial for overcoming the inertia and resistance that can plague decision-making processes, especially in times of uncertainty. Resource fluidity indicates the firm's agility in reallocating and reconfiguring its resources in response to changes (Heracleous et al., 2023; Doz and Kosonen, 2010). This capability is functional for enabling the organization to adapt its operational processes and business models swiftly. Resource fluidity is enhanced through flexible resource allocation processes, effective people management, and fostering a culture of adaptability.

Despite the established importance of strategic agility in enabling firms to adapt to external changes, there has been limited exploration of its role in internal error management. Error management is critical for organizational learning and resilience, yet the mechanisms through which strategic agility can enhance error correction remain underexplored. Indeed, the integration of strategic agility into error management strategies offers a promising avenue for research. For instance, strategic sensitivity can enhance a firm ability to detect an error early and respond proactively. By fostering an environment where insights and feedback are continuously gathered and analyzed, firms can identify potential errors before they escalate into more significant issues. Similarly, leadership unity is critical for effective error management. When an error is detected, swift and decisive action is often required to mitigate their impact. Leadership unity ensures consistent organizational signals to the outside, without being hampered by indecision or internal conflict. Finally, resource fluidity enables the organization to adapt its operations in response to an identified error. By reallocating resources efficiently, the firm can address the root causes of errors and implement changes to prevent their recurrence.

Purpose of the paper. The purpose of this paper is to critically assess the role of strategic agility in error management within strategic communication frameworks. It delves into how the three capabilities associated with strategic agility—strategic sensitivity, leadership unity, and resource fluidity—enhance error management across error detection, error communication, and damage control phases. Integrating strategic agility with the strategic communication debate, especially focusing on error management, the study sheds light on the significance of adept, adaptable responses and the role of communication strategies in error mitigation, spotlighting the necessity for organizations to swiftly detect, correct, and communicate an error to maintain stakeholder trust. This exploration offers insights into leveraging strategic agility for strategic communication efforts, advancing practices in dynamic environments and providing a holistic perspective on navigating strategic communication challenges.

Methodology. The applied methodological framework employs a multi-source triangulation approach, analyzing various archival and secondary data pertaining to Samsung's Galaxy Note 7 case. This encompasses an in-depth review of internal reports, press releases, news articles, and social media discourse, aiming to capture a comprehensive view of the case management. Integrating single case study methods (Eisenhardt and Graebner, 2007; Siggelkow, 2007; Yin, 2017), with an interpretive historical analysis (Foster et al., 2017; Vaara and Lamberg, 2016; Wadhvani and Decker, 2017), the study focuses on source analysis to deconstruct public narratives and media engagements related to the case. This strategy facilitates a nuanced examination of Samsung's strategic response, highlighting the firm leverage of strategic sensitivity, leadership unity, and resource fluidity in addressing the incurred error. The analysis is further enriched through discussions with academic and industry experts, ensuring a robust interpretation of the data. This methodological approach allows for exploring the intricate processes of error detection, public acknowledgment, and strategic recalibration employed by Samsung, thereby illuminating the role of strategic agility in coping with the error and initiating recovery.

As far as it regards the context for the analysis, key historical and technical details are reported as follow. In a notable event during August of 2016, Samsung, market leader in the mobile phone industry, unveiled the Galaxy Note 7 in New York. This launch was anticipated to further cement Samsung's dominant position in the smartphone innovation. However, the trajectory of the Galaxy Note 7 took an unforeseen downturn shortly after its release to the market on the 19th of August. By the 24th of August, the initial instance of the device exploding was reported, sparking significant safety concerns surrounding the product. The gravity of these concerns was intensified when, on the 29th of August, a video

showcasing a damaged Galaxy Note 7 circulated on YouTube, escalating public alarm over the issue. A statement from a Samsung representative disclosed that the distribution of the Galaxy Note 7 was being postponed conducting further quality assurance tests.

In response to these episodes, Samsung embarked on a global recall on the 2nd of September. This situation escalated with a formal recall in the U.S. on September 15, alongside a program for battery replacement. In the wake of a prohibition by the US Department of Transportation against the carriage of the Galaxy Note 7 on flights, Samsung deployed personnel to airports to assist consumers and collect the devices, aiming for a complete recall. Within a span of less than three months, the firm achieved a global return rate of 96 percent.

On October 10, 2016, Samsung formally acknowledged the critical nature of the issue, announcing a cessation of sales and a voluntary recall of the Galaxy Note 7. This action was supported by the involvement of regulatory bodies worldwide, including the U.S. Consumer Product Safety Commission, and major carriers ceased the sale and exchange of the device, prioritizing consumer safety. Samsung's statement to the Seoul stock exchange emphasized the decision to discontinue the Galaxy Note 7 was taken with consumer safety as the paramount concern. Also, Samsung launched a refund and exchange program in the U.S. on October 13, offering remedies to affected customers while maintaining transparent communication with its stakeholders.

The repercussions of this issue were manifested, for example, in a decline in the smartphone sales for the quarter ending December 31, 2016, as compared to the preceding quarter. Samsung's business report from December 31, 2016, reflects a commitment to prioritizing consumer safety and innovation, detailing the implementation of comprehensive safety measures and the establishment of a dedicated safety verification team to avert similar incidents.

The technical challenges that led to the Galaxy Note 7 safety incidents were fundamentally rooted in the lithium-ion batteries' design and manufacturing flaws. At the core of the issue were internal short circuits and the propensity for thermal runaway, conditions that can lead to overheating, combustion, or explosions in such batteries. Lithium-ion batteries, which consist of positive and negative electrodes separated by an electrolyte, rely on this architecture for energy storage and release. However, the compactness of this design leaves minimal margin for error, as any breach in the separator or the introduction of metal particles can create a direct electrical pathway between the cathode and anode. This can cause rapid heat generation, culminating in hazardous outcomes.

For the Galaxy Note 7, these safety risks materialized due to specific technical shortcomings in the batteries supplied by SDI and ATL. The SDI batteries were found to suffer from internal short circuits, potentially caused by damaged or deformed electrodes and overly long negative electrodes. These defects could lead to bending and breaching of the separator, facilitating a short circuit. Similarly, the ATL batteries were compromised by the absence of insulation tape and the presence of protruding weld points, which could also pierce the separator or exert excessive pressure, resulting in short circuits.

Subsequent efforts by Samsung to address the issue included a detailed technical report presented on January 23, 2017, which elucidated the battery-related causes of the Note 7 incidents. This report was part of Samsung's broader commitment to enhancing product safety, evidenced by the establishment of an 8-Point Battery Safety Check and the formation of a Battery Advisory Group to ensure ongoing evaluation and improvement of battery safety standards.

By March 31, 2017, Samsung had managed to recover its smartphone sales to levels surpassing those prior to the Galaxy Note 7 incident. The launch of the Galaxy Note 8 on September 15, 2017, signified a new phase for Samsung, characterized by a renewed focus on quality and safety, alongside strategic investments in safety technologies and brand repositioning efforts.

Results. Utilizing strategic agility as a response mechanism to cope with the Galaxy Note 7 case, Samsung displayed a multi-faceted approach to error management, structured around three pivotal phases: error detection, error communication, and damage control.

At the outset, during August 2016, Samsung exercised strategic sensitivity, rapidly acknowledging stakeholder concerns following the initial reports of the Note 7's safety issues. A swift decision to halt shipments for additional quality assessments reflected the firm's immediate concern for consumer safety and brand reputation. In parallel, Samsung demonstrated resource fluidity by reallocating financial and human resources to bolster quality control and enhance customer service capabilities, which was pivotal for the initial recovery process. Leadership unity was evident as Samsung delivered clear and consistent messages, reflecting a concerted signal of concern and a commitment to resolution.

In the subsequent phase, during September 2016, Samsung's strategic sensitivity was marked by the proactive implementation of recalls, signaling an acute awareness of consumer perspectives and a readiness to address their safety concerns. Resource fluidity was manifested in the logistical coordination of the product recall, including the mobilization of employees and rapid technical updates to mitigate risks. Leadership unity during this phase was characterized by a unified public response from executives, setting clear objectives for the recall and ensuring alignment across the firms' various departments and regions.

Samsung's actions during the damage control phase (October 2016 – September 2017) reflected an integrated application of strategic agility's core capabilities. Strategic sensitivity was observed in the regular updates provided to the public and the formation of a Battery Expert Advisory Group to advise on safety and innovation. Resource fluidity was demonstrated by the extensive mobilization of research and development teams and the reallocation of resources towards R&D and safety investments. Leadership unity was evidenced by the clear and transparent communication from

the top executives, the strategic reprioritization of the firm's objectives, and the concerted effort to enhance the brand's focus on quality and safety.

Throughout all the phases, Samsung's approach to error management was marked by a commitment to transparency, customer safety, and quality assurance. The integration of strategic agility enabled the firm to navigate the complexities of the issue effectively, ensuring that both the immediate response and the long-term strategic realignment were handled with precision. This case illustrates how strategic agility can be a response mechanism for managing an internal error, with each phase of the error management process benefiting from the three capabilities underpinning strategic agility, namely strategic sensitivity, leadership unity, and resource fluidity.

Research limitations. This study, while offering new insights from the integration of strategic agility literature into error management strategies, acknowledges a number of limitations. Firstly, the reliance on a single case study, although in-depth, may limit the generalizability of the findings across different industries and organizational contexts. Future research could address this by examining a broader range of cases across various sectors. Secondly, the historical analysis approach might not capture the real-time decision-making processes and the dynamism of strategic agility in action. Incorporating longitudinal studies or real-time tracking of strategic decisions could provide additional depth. Lastly, the focus on strategic communication as a mechanism for error management may overlook other critical factors such as internal dynamics that may also play significant roles in the strategy process.

Managerial implications. The findings of this study hold practical implications for practitioners aiming to enhance their firms' strategic agility and, accordingly, their error management strategies. Firstly, cultivating an organizational culture that prioritizes strategic sensitivity, leadership unity, and resource fluidity can significantly improve error detection, communication, and damage control processes. Managers should invest in systems and training that encourage open communication and swift response to an error. Secondly, the case of Samsung underscores the importance of a unified leadership approach in navigating the incurred error, suggesting that leadership development programs should emphasize agility, consensus-building, and strategic decision-making. Lastly, the study highlights the need for organizations to maintain flexibility in resource allocation, suggesting that managers should regularly review and adjust resource deployment strategies to support rapid response to an error and market changes. Implementing these strategies can help organizations to manage an error more effectively, and possibly turn potential crises into learning opportunities.

Originality of the paper. This paper contributes to the existing literature by integrating strategic agility with error management within the context of strategic communication. By focusing on the Samsung Galaxy Note 7 case, this study illustrates how strategic sensitivity, leadership unity, and resource fluidity can collectively enhance an organization's ability to manage an error effectively. Unlike previous research that primarily examines strategic agility in the context of external environmental adaptation, this study highlights its significance in internal error management and strategic communication. This original contribution extends the discourse on strategic agility and provides a nuanced understanding of its application in critical situations, offering insights for both scholars and practitioners in the field of strategic management.

Do executive actions reflect their personality traits?: A review of organizational misconduct

PIERLUIGI GIARDINO¹ ANDREA CAPUTO²

Abstract

This study endeavors to delve into the personality traits that contribute to ineffectual management practices within companies, concentrating specifically on key decision-makers such as CEOs and other top-tier management personnel. It is underpinned by two established theoretical frameworks: the Upper Echelon Theory and the Theory of Planned Behavior. Furthermore, this research adopts a meticulous approach to systematically gather, assess, and analyze existing knowledge, with the dual goal of establishing a thorough research agenda. Consequently, upon completion, this study promises to offer valuable insights for scholars, professionals, investors, policymakers, and stakeholders alike.

Keywords: irresponsible management, corporate misconduct, apical decision makers, systematic literature review, research agenda

1. Introduction

In a context of increasing emphasis on firms' commitment to a positive and sustainable impact on society, incidents of irresponsible management - defined as "activities and actions that organizational members engage in to deceive or swindle investors or other key stakeholders, including acts that violate laws or regulations or that are legal but considered morally wrong,

such as earnings management, financial statement or other accounting fraud, regulatory violations, actions that result in class action lawsuits, and anti-competitive actions, potentially harming firm stakeholders, eliciting negative reactions from those stakeholders, and being perceived as reasonably avoidable" (Neville et al., 2019; p. 2541) - generate always great perplexity. In the last decades, notable examples include Enron, Volkswagen, Boeing, Theranos, Wells Fargo, Lehman Brothers, WorldCom, France Telecom, Tyco International, Wirecard, Parmalat, FTX, Goldman Sachs and many others.

Comprehending why firms act irresponsibly poses a significant challenge. However, by examining the behavior of apical decision-makers (i.e., top managers, executives, and entrepreneurs), it is possible to gain valuable insights, as they hold the ultimate authority in resource allocation, shaping organizational culture, managing stakeholder relationships, setting strategic visions, handling risks, and addressing legal and ethical concerns. To do so, this article is grounded in the Theory of Planned Behavior (TPB) by Ajzen (1991), which posits that individuals' intention to pursue a specific action is influenced by their behavioral, normative, and control beliefs, moderated by skills and environmental constraints. Thus, grounding in TPB is helpful to engage in a comprehensive exploration of the various dimensions influencing apical decision-makers misconduct (i.e., psychological, behavioral, and socio-demographic factors), while also accounting for contextual elements such as culture, incentives, regulations, competition, board structure, and the role of other stakeholders.

Among the various dimensions under consideration, the psychological one presents the most challenging issues given its nature. Notably, within this complex realm, the enduring nature of personality traits makes them pivotal when dealing with the inclination towards misconduct. This holds because personality traits are "relatively stable, consistent, and enduring internal characteristics inferred from patterns of behaviors, attitudes, feelings, and habits in individuals [they prove] useful in summarizing, predicting, and explaining an individual's conduct" (American Psychological Association, 2023a). However, understanding and evaluating the role of personality traits face substantial theoretical and practical constraints. For instance, scholars encounter difficulties in directly assessing the personality traits of top decision-makers (Van Scotter, 2020), leading them to overemphasize easily accessible traits such as narcissism (Borgholthaus et al., 2023). Additionally, the lack of a clinical psychology background among these scholars (Van Scotter and Roglio, 2020) has resulted in the analysis of specific traits separately rather than as part of a complex biosychosocial system (Garcia, 2020).

² University of Trento
e-mail: andrea.caputo@unitn.it

Despite these challenges, recent advancements in unobtrusive assessment techniques, such as videometric, paralinguistic, and text analyses (Petrenko et al., 2016; Harrison et al., 2019, Marrero et al., 2022), offer promising solutions for scholars to address and overcome these limitations, thus reinvigorating this field of research. Yet, these research avenues are not exempted from challenges and critical flaws, consequently, this paper aims to address the following research questions paving the way for future scholars: What is the role of personality traits as catalyst for apical decision-makers' irresponsible management? and What is the current state of knowledge in this field of research?

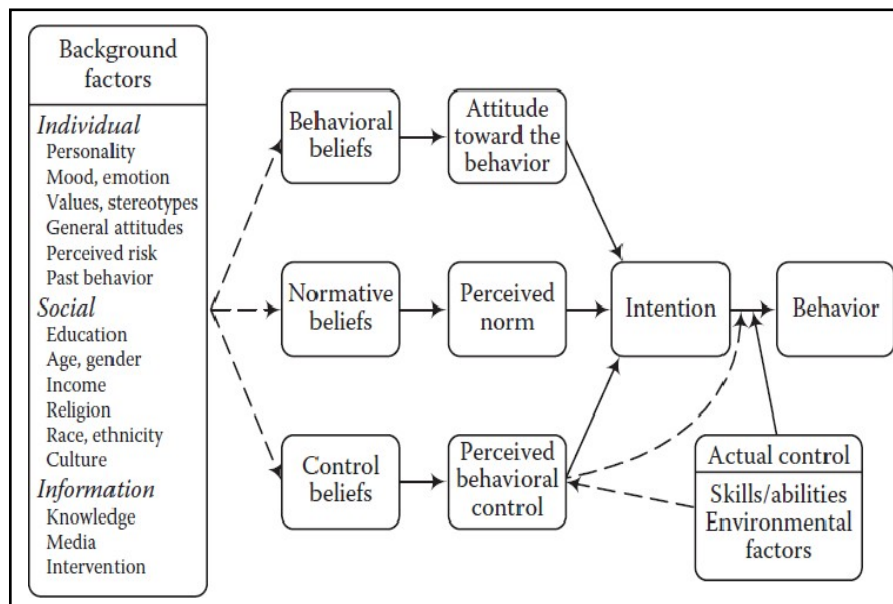

To tackle these questions, this study is based upon a systematic literature review (SLR) of 36 articles published between 2002 and 2023 providing a fine-grained assessment of the current knowledge on this field of research. Within the following sections, this study meticulously examines the theoretical underpinnings, elucidates the methodological approach, engages in a comprehensive discussion of the state-of-the-art literature, and formulates a research agenda.

2. Theoretical background

2.1 Theory of Planned Behavior

Grounded in social psychology, the Theory of Planned Behavior (TPB) (Ajzen, 1991; Fishbein & Ajzen, 1975; Ajzen & Fishbein, 1980) posits that intention to perform a behavior stems from attitude, subjective norm, and perceived behavioral control (Ajzen, 1991, p. 188). Background factors indirectly shape intentions and behaviors (Ajzen & Fishbein, 2005; Ajzen, 2011), with TPB serving to elucidate these influences (Ajzen, 2020, p. 318).

Figure 1 Theory of Planned Behavior (Ajzen and Fishbein, 2005).

TPB's versatility is evident in its application to various management topics, including unethical decisions. Carpenter and Reimers (2005) studied managers' decisions to violate accounting standards, while Kulik et al. (2008) examined factors influencing ethical behavior. Cohen et al. (2010) linked individual managers' psychological aspects to fraud opportunities. Egor et al. (2022) used TPB to explore unethical practices among CEOs and crony directors.

2.2 The role of personality considering the Theory of Planned Behavior

Personality, a crucial determinant of intention, encompasses interconnected behavioral, cognitive, and emotional traits shaping individuals' adaptation to life (Ajzen, 2011; American Psychological Association, 2023b). These enduring patterns of thoughts, feelings, and behaviors influence how individuals perceive and respond to various situations (American Psychological Association, 2023a). Psychologists categorize these traits into broad factors like the Big Five or Dark Triad, understanding that individuals exhibit varying levels of each trait (Garcia, 2020). These trait configurations yield distinct cognitive, emotional, and social responses.

The Theory of Planned Behavior (TPB) offers a valuable framework for exploring the interplay between personality traits and behavioral outcomes. For instance, in organizational contexts, decision-makers high in conscientiousness tend to comply with rules due to their positive attitude towards them. Those high in extraversion may be swayed by normative influence, while those high in neuroticism may struggle with emotional regulation, impacting their behavior under stress. Studying personality traits associated with unethical management sheds light on the dark side of top management behaviors and their influence on corporate misconduct.

3. Methodology

3.1 Research design

To ensure a rigorous, transparent, and replicable review of existing knowledge, as well as to enhance the legitimacy of our findings, we opted for conducting a systematic literature review (SLR) (Tranfield et al., 2003). This methodological choice allows us to synthesize all relevant evidence, effectively mapping and evaluating the current intellectual landscape. This, in turn, enables us to refine existing theoretical foundations and develop an agenda to move ahead in this research domain (Fan et al., 2022).

3.3 Article collection

By using the query string (see Table 1) we proceed with article collection. The flowchart illustrated in Figure 2 shows that the research began with a broad search across databases, yielding 4,495 articles in business, management, and accounting. After screening titles and abstracts, 937 relevant articles remained. Full-text examination, guided by strict inclusion criteria, narrowed the selection to 31 pertinent articles addressing corporate governance, organizational misconduct, and personality traits in top decision-makers, all peer-reviewed. Further scrutiny of referenced works identified four additional articles meeting the criteria, resulting in a final sample size of 36.

Table 1 Strings of keywords.

Area	Keywords
Corporate governance	"entrepreneur*", "own*", "found*", "president*", "direct*", "lead*", "senior*", "executive*", "Chief*", "C*O*", "CAO*", "CCO*", "CDO*", "CEO*", "CFO*", "CIO*", "CMO*", "COO*", "CRO*", "CSO*", "CTO*", "top manage*", "TMT*", "board*", "c suit*", "c level*", "upper echelon*", "chair*", "white collar"

4. Results

4.1 Preliminary analyses

We followed the method by Caputo and Kargina (2022) to extract and merge the data regarding the 36 (34 articles and 2 reviews) contributions, enabling then an in-depth analysis using the Bibliometrix R package (Aria and Cuccurullo, 2017). By doing so it appeared that scholars' interests can be categorized into three clusters: those who focused on narcissism ($n = 22$; $\% = 61$), psychopathy ($n = 6$; $\% = 17$), and Machiavellianism ($n = 3$; $\% = 8$). It is noteworthy, however, that only the remaining five articles ($\% = 14$) addressed two or more personality traits simultaneously. This is significant, considering psychological literature emphasizes that individual behavior is not solely defined by a single personality trait but rather by a combination of various traits. This discrepancy highlights a crucial flaw in the management literature that needs to be addressed. Consequently, the rest of the article is structured as follows: first, we delve into each of the three clusters independently, and later, in the discussion section, we aim to fill this gap by presenting a more integrated and holistic examination of the literature.

4.2 Cluster analysis

4.2.1 Narcissism and corporate misconduct

The American Psychological Association Dictionary (2023c) defines narcissism as "excessive self-love or egocentrism". Within academic discourse, various perspectives on narcissism exist. Despite the American Psychiatric Association's (2013) classification of narcissism as a personality disorder, this article adopts the perspective put forth by Raskin and Hall (1979) and by Emmons (1987), treating it as a normal personality trait.

Among the scholarly articles that have dealt with narcissistic apical decision-makers, it is noteworthy to mention the contribution of Lubit (2002). He was among the first in management and business sciences to emphasize the need for identifying and addressing the potentially destructive effects of narcissistic behavior within the organizational hierarchy. Specifically, Lubit (2002) highlighted the importance for organizations to examine their cultural setting to prevent and discourage the presence of people with such characteristics.

A few years later, Chatterjee and Hambrick (2007) empirically demonstrated that narcissistic CEOs are naturally more inclined to make attention-grabbing decisions that may lead to either significant successes or tremendous failures. Specifically, CEOs' egocentrism represents a double-edged sword. For instance, narcissism can prompt apical decision-makers to invest in innovation, but it can also lead them to prioritize their interests over stakeholders' interests, compromising ethical and safety standards (Petrenko et al., 2016; Kashmiri et al., 2017).

In this vein, O'Reilly et al. (2018) unveiled the tendency of narcissistic CEOs to discount expert advice, making them more prone to risk-taking and intuitive decisions. This finding aligns with Li et al. (2022), who highlighted the correlation between prestigious awards and the propensity for financial misconduct among CEOs, indicating how their grandiose sense of superiority increases the likelihood of unethical or illegal behaviors. However, this latter conclusion is contradicted by Kalbuana et al. (2023) who identified a positive correlation between high CEO narcissism and a decrease in corporate tax avoidance.

4.2.3 Psychopathy and corporate misconduct

According to the 2023 edition of the American Psychological Association Dictionary, the term "psychopathy" is synonymous with antisocial personality disorder. It is defined as "a chronic and pervasive disposition to disregard and violate the rights of others. Manifestations include repeated violations of the law, exploitation of others, deceitfulness, impulsivity, aggressiveness, reckless disregard for the safety of self and others, and irresponsibility, accompanied by lack of guilt, remorse, and empathy". Despite the current identification by the American Psychological Association (2023d), the business and management literature predominantly refer to this phenomenon as "psychopathy" - consequently, to maintain consistency, this study will adopt the same terminology.

According to the information retrieved from the dataset, Clive R. Boddy is credited as the first to conceptualize the notion of "corporate psychopaths" in 2006. He underscored the necessity of investigating the influence of such individuals - who represent 1% of the world

population - on organizational misconduct, business sustainability, and corporate social responsibility. Adding to this discourse, Babiak et al. (2010) shed light on the capacity of psychopaths to manipulate others through their communication skills and charisma. These scholars specifically suggested that corporate psychopaths manage to progress in their careers despite exhibiting poor performance in the workplace.

This assertion was corroborated by Boddy et al. (2010), who highlighted that corporate psychopaths are more prevalent in senior positions within organizations. This suggests that individuals without conscience may be in control of significant corporate resources and may prioritize their self-interest over the organization and its stakeholders' interests. Boddy (2011) further posited that corporate psychopaths played a significant role in precipitating the 2007-2008 global financial crisis, which originated with a subprime mortgage lending crisis in 2007 and evolved into a global banking emergency when Lehman Brothers crashed into bankruptcy (Kenton, 2023).

This claim is also supported by Boddy et al. (2015), who empirically demonstrated that despite their short-term successes, corporate psychopaths' conduct is detrimental to the long-term prosperity of the organizations they oversee because they often engage in fraudulent activities as well as displaying bullying, fear-mongering, and manipulative behaviors - ultimately jeopardizing organizational outcomes. For instance, Boddy (2023) found that, due to their profound disregard for corporate social responsibility and their willingness to falsify environmental impact reports, corporate psychopaths are likely to engage in deceptive practices (e.g., unlawful disposal of toxic waste materials).

4.2.3 Machiavellianism and corporate misconduct

The American Psychological Association Dictionary (2023e) defines Machiavellianism as “a personality trait marked by a calculating attitude toward human relationships and a belief that ends justify means, however ruthless. A Machiavellian is one who views other people more or less as objects to be manipulated in pursuit of his or her goals, if necessary through deliberate deception”.

Among the scholarly articles that have studied the link between personality traits and apical decision-makers' inclination to misconduct, Machiavellianism has received less attention compared with narcissism and psychopathy. However, scholars have produced interesting results. For example, in their exploration of Chinese decision-makers, Al-Khatib et al. (2007) revealed a tendency for individuals high in Machiavellianism to resort to deceptive negotiation tactics, such as misrepresentation and false promises. Their inclination toward viewing negotiations as zero-sum games, can erode trust and cooperation, ultimately fracturing long-term relationships between organizations and their stakeholders.

Further shedding light on the link between Machiavellianism and unethical behavior, Kish-Gephart et al. (2010) emphasized how Machiavellian decision-makers tend to manipulate interpersonal relationships opportunistically, using deception and exploitation to serve their personal interests. This manipulation can extend to actions such as falsifying financial results,

deceiving shareholders, and engaging in other unethical practices to further personal gains, disregarding ethical standards and potentially causing harm to stakeholders.

Moreover, the study by Shafer and Lucianetti (2018) elucidated how Machiavellian apex decision-makers may exhibit resistance to sustainability and environmental responsibility reports. In fact, these individuals, by prioritizing immediate gains, might view such reports as a hindrance to short-term profits due to their focus on long-term investments. Additionally, these reports demand transparency and accountability, challenging the secretive nature and desire for control of Machiavellians. Changes associated with such initiatives could disrupt the status quo that serves their interests. Finally, implementing these reports would represent an emphasis on communal benefit over personal gain, which does not align with the self-serving nature of Machiavellian decision-makers.

5. Discussion and research agenda

This article explores the nexus between personality traits and the proclivity of top decision-makers towards misconduct. Through a systematic literature review (SLR), we highlight narcissism, psychopathy, and Machiavellianism as pivotal factors in fostering such inclinations, employing the Theory of Planned Behavior (TPB) (Ajzen, 1991) as a conceptual scaffold to elucidate their contributions to unethical behaviors.

Ajzen (1991) delineates the TPB's first determinant, attitude, as pivotal in shaping intentions. Decision-makers with grandiose narcissism often prioritize personal acclaim over ethics, facilitating misconduct (Li et al., 2022). Similarly, those high in psychopathy manipulate situations to their advantage, disregarding ethical standards (Boddy, 2023). Likewise, Machiavellian decision-makers exploit circumstances for personal gain, indifferent to potential harm (Kish-Gephart et al., 2010), suggesting a direct link between dark triad traits and unethical conduct.

The TPB's second determinant, subjective norm, underscores the influence of social pressure. Narcissistic leaders seek validation, sometimes resorting to misconduct (Kashmiri et al., 2017). Psychopathic decision-makers feign compliance while furthering self-interests (Boddy, 2023), fostering a culture that tolerates unethical practices (Shafer and Lucianetti, 2018), aligning with the dark triad's manipulation of norms.

Lastly, perceived behavioral control, the TPB's third determinant, reflects ease or difficulty in behavior execution. Narcissistic decision-makers exhibit high perceived control due to their inflated self-perception (Li et al., 2022). Similarly, psychopaths navigate situations effortlessly due to their manipulative skills (Boddy, 2011), as do Machiavellians, owing to strategic thinking (Al-Khatib et al., 2007), suggesting a positive correlation between dark triad traits and perceived control.

Despite synthesizing literature comprehensively, this study identifies significant gaps, including disproportionate focus on narcissism and challenges in measuring decision-makers' personalities. Hence, insights drawn from the SLR suggest avenues for future research (Table 2).

Table 2 Research agenda.

Future Research Avenues	
<i>CEOs... and not only</i>	Current research primarily focuses on CEO misconduct, but it's essential to also study other board members or founders. Organizations are rarely led solely by one person nowadays. Broadening research scope can provide a better understanding of how personality traits affect misconduct in firms.
<i>Angels vs Demons</i>	Understanding how "dark" executives influence board members and how "light" executives reduce misconduct risks remains unclear. Investigating potential selection bias in board turnover towards either "angels" or "demons" executives is intriguing. Exploring executive contagion, where personalities shift, offers valuable insights.
<i>V.I.P. (very important personality traits)</i>	Assessing top decision-makers has historically been challenging for scholars, often resorting to unreliable indicators like CEO picture size. New unobtrusive assessment techniques like videometric and text analyses are revolutionizing research. However, studies tend to analyze personality traits individually rather than within a comprehensive biopsychosocial framework.
<i>Even scholars need Heroes</i>	Business and management scholars should start collaborating more often with clinical psychologists and psychiatrists. This will allow not only to produce more robust results but also to implement additional and more sophisticated measures that are still uncommon in the business and management literature (e.g., the B-Scan which may allow to gain more nuanced insights into psychopathic strategies in the corporate world).
<i>See the full landscape</i>	Corporate misconduct is multifaceted and not solely attributable to personality traits. Understanding why top decision-makers engage in unethical behavior requires considering various factors at individual, group, industry, and macro levels. For example, tenured executives may exhibit overconfidence due to experience, while individuals from impoverished backgrounds may turn to fraud for financial security. Industry dynamics and regulatory loopholes also play significant roles. Integrating these perspectives is vital for a comprehensive understanding and effective prevention of corporate misconduct.
<i>Scandals echo through time</i>	While modern research methodologies have their own merits, the use of seemingly archaic approaches like historical case studies can offer unique insights. Investigating corporate misconduct through historical case studies yields valuable insights into recurring patterns in decision-making and regulatory flaws. By comparing similar instances over time, scholars can understand how apical decision-makers think, act, and react. The resulting knowledge will be beneficial also for policymakers to refine robust and adaptable legal measures to prevent corporate unethical or illegal behaviors.

Moreover, to advance research on why firms misconduct, there is a critical need to shift focus beyond the CEO and examine the roles of other key figures like other board members and founders. This includes investigating the interplay between executives with "dark" and "light" traits as well as addressing potential biases and heuristics behind the choice of pursuing unethical or illegal behaviors. Leveraging on advanced assessment tools such as videometric and text analyses can provide deeper insights as well as allowing scholars to stop dealing with personality traits separately rather than as part of a complex biopsychosocial system. To facilitate this, fostering collaborations between business scholars and clinical psychology experts is crucial. This interdisciplinary approach can not only lead to more trustworthy and empirically valid results but also to the adoption of more sophisticated measures like the B- Scan 360. Furthermore, scholars should consider diverse factors like experience, socioeconomic backgrounds, industry dynamics variables - possibly simultaneously - when investigating unethical and illegal decisions. In fact, by integrating these perspectives, future studies can offer a comprehensive understanding of the complex drivers behind corporate misconduct, paving the way for effective preventive measures and adaptable legal frameworks within organizations.

6. Conclusion

This article presents a pioneering systematic literature review (SLR) on the influence of personality traits on top-level decision-makers' attitudes, subjective norms, and perceived behavioral control in the context of irresponsible management. It offers a twofold contribution: firstly, addressing the fragmented treatment of personality traits in management literature by advocating a holistic approach, and secondly, enhancing the understanding of irresponsible management beyond specific frameworks like the fraud triangle to encompass broader catalyst forces.

The research holds significant implications for scholars, practitioners, and policymakers. Organizations can utilize insights to screen and train leaders for ethical decision-making, while policymakers can enact preventive measures and legal frameworks to curb misconduct. Additionally, the study provides a timely and comprehensive SLR, filling a gap in the literature and setting a research agenda for future exploration.

Acknowledging limitations, such as potential errors in article selection or interpretation, the article encourages further inquiry into the generation of corporate misconduct. Overall, it serves as a foundational step for advancing understanding and addressing such occurrences effectively.

Governing Micro-Municipalities: A Literature Review

MATTEO CRISTOFARO¹ NICOLA CUCARI² ANTONELLA MONDA³
DAVIDE LIBERATO LO CONTE⁴ ANASTASSIA ZANNONI⁵ LEUL GIRMA⁶ PINALBA SCHILLECI⁷
FRANCESCO LAVIOLA⁸ SIMONA MARE⁹

Abstract

The study explores the significance of Micro-Municipalities as prevalent forms of local governance globally, focusing on network relationships that shape community dynamics. Through a systematic literature review of 30 articles, it identifies four key nodes impacting municipal governance: society, stakeholders, residents and administrators. These nodes influence governance differently, depending on the resources exchanged in their relationships. The research proposes a network-based framework highlighting the need for multifaceted cooperation among these entities to enhance municipal governance. This framework offers insights for researchers, administrators and policymakers, addressing critical issues such as resource allocation, development initiatives, depopulation challenges, and sustainability. Overall, the study contributes to a deeper understanding of Micro-Municipalities and offers practical implications for improving their governance.

Key words: *Micro-Municipality; Governance; Network; Systematic literature review*

Framing of the research. *Micro-municipalities, a form of local government with a population of approximately 5000 inhabitants (Giacomini et al., 2018; United Nations, 2019), constitute the majority of local public entities in states around the world. In the U.S., about 76% of the approximately 19,500 municipalities have fewer than 5,000 residents; of those, almost 42% have fewer than 500 people (Statista, 2019). In Europe, 47% of micro-municipalities have less than 5,000 inhabitants (OECD, 2018, p. 6). Additionally, municipalities constitute an integral part of national and regional cultural heritage and play a pivotal role in current efforts toward sustainable revitalization (Baiocco et al., 2023) - a key driver for achieving the United Nations Sustainable Development Goals (UN Tourism, 2023). Due to their peculiar characteristics, municipalities require network support in managing urbanization, building/renovating infrastructures, and providing essential services, which has significant implications for their administrative structures (Atkinson, 2019).*

Previous scholarly investigations have produced various models concerning public governance, also considering a network perspective (Provan and Kenis, 2008; Klijn and Koppenjan, 2015; Koliba et al., 2017). Notably, Naveed and Azhar (2022) uncovered the significance of self-governance mechanisms within public networks, emphasizing the independent participation and interactions among various actors. This dynamic fosters the generation of collective solutions to shared problems. However, despite scholars investigating municipalities' governance facets (e.g., Kasymova and Schachter, 2014; Catlaw and Stout, 2016; Lara-Rubio et al., 2022), there is no systematization of results that would guide the reader to a deeper understanding of the various relationships that influence municipal governance. Failing to fill this void hinders our ability to comprehend the dynamics influencing micro-municipal governance, potentially leading to ineffective governance strategies, misallocating resources, and an inadequate response to the challenges posed by

depopulation. The cost of not addressing this gap is a missed opportunity for informed governance, policymaking, and sustainable development tailored to the unique dynamics of municipal communities (Powe et al., 2022). Since they have a different role than towns and metropolises within their administrative dynamics, municipalities require a governance that resonates with their unique characteristics (Bel and Warner, 2015), challenging the notion of a one-size-fits-all approach.

Purpose of the paper. This study reviews the network relationships that influence municipalities' governance. Adopting a network perspective of public governance (Dimitrijevska-Markoski and Nukpezah, 2022; Naveed and Azhar, 2022), we first identified the four most significant network entities influencing micro-municipal governance: society, stakeholders, residents and administrators. For each, we identified the positive, neutral, or negative influences exerted on municipal governance and the resources exchanged within the relationship. In doing that, our work resonates with the call for further research on the relationship between network structure and mechanisms (Giacomini et al., 2018). Departing from the results, we propose a network-based framework depicting micro-municipal governance from a network perspective, prioritizing a multifaceted collaboration among the recognized entities. Furthermore, the framework highlights the relationships that need more attention in future studies that complement the research agenda for scholars we propose from the literature analysis - which includes the call for a nuanced definition of municipalities, in-depth analyses of identified relationships, and methodological pluralism.

Methodology. A systematic literature review (SLR) has been considered the most appropriate research design to consolidate and synthesize academic research regarding micro-municipal governance (as suggested by Edmondson and McManus, 2007). We followed an established process used in other SLRs (e.g., Cristofaro and Giannetti, 2021). In particular:

- 1) We used these databases to search for studies: Business Source Complete (EBSCO), Econlit, ISI Web of Science, Scopus, and ProQuest's ABI/Inform.
- 2) We limited our search to only peer-reviewed journal articles published in English. The research was not restricted to a given starting period (end period December 2023), and we did not apply any Journal exclusion criteria.
- 3) We selected articles if they include at least one of the following keywords: "municipal*"¹⁰ or "village*" or "town*" or "city" or "cities" or "suburb*" or "hamlet*" or "borough*" or "burg*" or "local*" or "urban" or "settlement*". We reached 68,563 hits.
- 4) We filtered for articles including at least one of the following keywords: "admin*" "manage*" or "govern*." We reached 6,567 hits.
- 5) We eliminated duplicates using reference-manager software. 4,290 hits remained.
- 6) From the 4,290 hits, we scanned articles by reading their titles and abstracts to ensure their substantive context was consistent with the aim of our review. This resulted in a sample of 598 articles.
- 7) The remaining articles were read in full to ensure their alignment with the research objective: contributing to the governance of municipalities. We specifically provided that the precise municipal dimension given by the practice (i.e., 5,000) could have been retrieved by reading the article; we discarded contributions that did not specifically identify the municipal dimension or give cues to it. This resulted in a sample of 27 articles. Cronbach's alpha regarding inter-rater reliability was 0.84.
- 8) We added three articles to the sample via the snowballing technique. The final sample is composed of 30 articles.

For steps 6) and 7), three authors individually read the articles and then compared their evaluation. If there was disagreement, the authors re-assessed their reports and decided whether to include the articles within the sample or otherwise. Chronbach's alpha regarding inter-rater reliability was 0.85.

For each article, we collected/coded publication i) year, ii) author(s), iii) Journal, iv) research question/goal/aim of the article, v) type of article, vi) adopted theory, vii) data collection, viii) study setting, ix) data analysis, x) dimension of the municipality, xi) node 1 and node 2, xii) the effect of node 1 on node 2 (positive, neutral, or negative), xiii) type of resource(s) exchanged, and xiv) public administration practice. Thanks to the identified nodes and relationships we built a framework for micro-municipal administration following a network perspective (Kim, 2006; Koliba et al., 2017).

Results. This section provides descriptive statistics of the investigated sample regarding the a) distribution of articles over time, b) the distribution of articles by journal, c) the adopted theoretical perspective, d) the adopted data collection and analysis methods, e) the public administration practices behind the exchange of resources, and f) the criteria considered for defining the micro-municipality.

Concerning the distribution of publications by year, between 2007 and 2017, articles were consistently produced at a low frequency. However, there was a notable improvement from 2018 to 2023 (from two to six articles). The frequency of publications suggests that the administration of micro-municipalities debates in the academic literature are a niche despite their relevance in public administration. Regarding the journal distribution, the most prolific outlet is *Cities* (4; 13%).

Regarding the adopted theoretical perspective, the most adopted perspectives were Good Governance (4; 13%) and Stakeholder Theory (3; 9%). The most common method for data collection is secondary data, accounting for 27% of total occurrences, followed by interviews (24%); accordingly, the descriptive approach was the most frequently used data analysis method (29%). Among the public administration practices behind the exchange of resources, the subject of inter-

¹⁰ The asterisk at the end of a search word allows for different suffixes.

administrational interactions is discussed in ten articles (33%), while participatory tools, transparency, public service commitment, and financial management are explored in four articles each (52% in total). Regarding the adopted criteria used for defining a micro-municipality, the number of inhabitants is the most adopted, and 25 articles (83%) identify this local entity as having no more than 5,000 inhabitants.

Finally, the research uncovers four nodes that affect micro-municipal administration:

- 1) *Society*: encompassing citizens, media, political parties, and universities, sets the broader context;
- 2) *Stakeholders*: this node includes various entities such as local self-administrations, entrepreneurs, investors, bureaucratic agencies, and informal community leaders;
- 3) *Residents*: citizens subject to the influence of the administration who can in turn actively influence the administration;
- 4) *Administrators*: this node centralizes the formal leadership and administrative structures.

These factors influence micro-municipalities' administration differently, according to the resources exchanged in these relationships. The analysis of exchanged resources among nodes shows that intellectual ones account for 26% (14) of the total.

Table 1. Summary of identified network influences on micro-municipality' governance

Node 1	Node 2	Relationship drivers	Authors	Direction	Public administration practice
Society	Micro-Municipality Administration	Unemployment Increased income per capita Reduced fiscal pressure	Lara-Rubio <i>et al.</i> (2022)	Positive	Financial management
		Higher population Lower unemployment Female municipal leadership Micro-Municipality public servant	Zagrapan and Spáč (2022)	Positive	Transparency
		Economic expansion Infrastructure investment Government intervention Targeted poverty alleviation Connection with towns	Tang <i>et al.</i> (2023)	Negative Negative Negative Positive Neutral	Inter administrative relationships
Stakeholders	Micro-Municipality Administration	Inter-local service agreements	Previtali, P. (2015)	Neutral	Inter administrative relationships
		Mandatory inter-municipal cooperation (IMC)	Giacomini <i>et al.</i> (2018)	Positive	Inter administrative relationships
		Tools for stakeholder participation in local development	Vitálišová <i>et al.</i> (2021)	Positive	Participatory tools
		Involvement of higher-level governments	Yi <i>et al.</i> (2018)	Positive	Inter administrative relationships
		Community leadership	Liu and Han (2023)	Positive	Inter administrative relationships
		Dissemination of methods of good governance	Sara and Saputra (2021)	Positive	Financial management
Micro-Municipality Administration	Residents	Efficient services and municipality Richest and most indebted municipality Right-wing or female mayors Lower voter turnout	Benito <i>et al.</i> (2021)	Positive	Transparency
		Proactive transparency	Sofyani <i>et al.</i> (2023)	Positive	Financial management
		Government-led redevelopment	Zhang <i>et al.</i> (2019)	Positive	Inter administrative relationships

		Top-down facilitation of public participation Politicization of public space Inadequate information disclosure	Hidayat <i>et al.</i> (2019)	Negative	Participatory tools
		Community report cards Budget discussion	Kasymova and Schachter (2014)	Positive	Participatory tools
		Accountability practices involving the community Micro-Municipality responsiveness Streamlined processes	Annahar <i>et al.</i> (2023)	Positive	Participatory tools
		Performance management systems	Beeri <i>et al.</i> (2019)	Positive	Performance management
Administrators	Micro-Municipality Administration	Familial and peer encouragement Social acceptance	Pamungkas <i>et al.</i> (2020)	Positive	Transparency
		Public service motivation and compassion	Liu <i>et al.</i> (2022)	Positive	Public service commitment
		Local leadership strategies for legitimation	Steenbergen (2016)	Positive	Urban regeneration
		Appointed volunteer boards provided with information and procedures and training	Dougherty and Easton (2011)	Positive	Public service commitment
Administration	Stakeholders	Good administration principles	Zaitul <i>et al.</i> (2023)	Positive	Inter administrative relationships
		Italian initiative "Houses at 1€"	Pera (2021)	Neutral	Urban regeneration
		Urban regeneration policies	Xiao <i>et al.</i> (2022)	Neutral	Urban regeneration
		Communication and coordination challenges	Fatimah <i>et al.</i> (2023)	Negative	Inter administrative relationships
Residents	Micro-Municipality Administration	Accountability and value for money attitude of residents	Jayawarsa <i>et al.</i> (2021)	Positive	Financial management
		Power distance Uncertainty avoidance Collectivism Femininity	Sonbay <i>et al.</i> (2022)	Negative Positive Positive Positive	Financial management
		Perception of micro-municipality elections	Tan and Qiushui (2007)	Positive	Public service commitment
		Collective self-governance	Zhang <i>et al.</i> (2022)	Positive	Inter administrative relationships
		Representative participation Project participation Problem-oriented self-organization	Kondratyev and Fadeeva (2021)	Negative Positive Positive	Public service commitment

Source: own elaboration

In Table 1, we present a comprehensive summary of network influences on micro-municipal administration, focusing on the relationships and effects (positive, negative or neutral) between the studied nodes (society, stakeholders, residents and administrators) and the micro-municipal governance. The table is organized based on the nodes from which the effect departs. This table serves as a foundational reference for the subsequent sections of this article, where influences will be examined and discussed. Figure 1 summarizes the relationships that emerged from the systematic review, the influences of which are observed below.

Figure 1. Relationships emerging from the SLR between the nodes of the network and the Micro-Municipal Governance

Source: own elaboration

Impact of Society on Micro-Municipal Governance

The studies conducted by Lara-Rubio et al. (2022), Zagravan and Spáč (2022), and Tang et al. (2023) examine the intricate relationship between society and municipal governance functioning. Lara-Rubio et al. (2022) focus on financial resources' role in society-municipality relations, identifying societal drivers such as unemployment, income per capita, and fiscal pressure influencing loan default risk in Spanish villages. They suggest tailored financial policies, including subsidizing loan interest rates, to address depopulation, promote youth employment, and reduce property tax burdens. Zagravan and Spáč (2022) investigate proactive transparency in Slovakian villages, finding associations between population size, unemployment rates, female leadership, and transparency levels, albeit challenged by personnel shortages and limited resources. Tang et al. (2023) analyze factors influencing built-up land development in Chinese villages, highlighting the complex interplay of scarcity, development intensity, economic expansion, infrastructure investment, and administration intervention. They recommend prioritizing urban development policies and integrated approaches for balanced village-town relationships, emphasizing the importance of physical, natural, and financial resources.

Impact of Stakeholders on Micro-Municipal Governance

This section synthesizes findings from six studies focusing on different aspects of village stakeholders' impact on micro-municipal governance. Previtali (2015) examines the effect of Italian administrative reform on inter-local service agreements, revealing a prevalent "collaborative inertia" among local governments. Giacomini et al. (2018) highlight the efficiency benefits of mandatory inter-municipal cooperation (IMC) in small Italian municipalities, particularly in reducing administrative costs and enhancing institutional legitimacy. Yi et al. (2018) explore interlocal collaboration in China, noting its focus on achieving sustainable economic growth and the formalizing role of national and provincial administrations. Vitálišová et al. (2021) investigate stakeholder participation tools in Slovakian villages, noting citizens' involvement in planning phases but decreased engagement in review and communication stages. Liu and Han (2023) observe that informal community leadership significantly enhances local governance through interactive feedback processes, stressing the importance of credibility and strategic organization to foster continuous participation and involvement in collective action.

Impact of Residents on Micro-Municipal Governance

This section explores studies highlighting how residents influence the practices of micro-municipal governance. In Bali, Jayawarsa et al. (2021) examined economic and financial management in traditional villages, emphasizing community commitment to empowerment and the need for value-based performance. Sonbay et al. (2022) explored how local culture affects financial system implementation in an Indonesian village, stressing the importance of cultural sensitivity. In China, Tan and Qiushui (2007) investigated village elections, revealing villagers' skepticism despite perceiving elections as fair, suggesting the importance of education and empowering elected committees. Kondratyev and Fadeeva (2021) and Zhang et al. (2022) focused on human and social resources' role. Zhang et al. (2022) discussed rural collaborative governance in Liushe Village, advocating for a combined top-down and bottom-up approach for sustainable rural development. Kondratyev and Fadeeva (2021) analyzed rural residents' self-organization in Russian villages, highlighting the need for nuanced governance strategies and inclusive practices.

Impact of Administrators on Micro-Municipal Governance and Stakeholders

This section examines studies elucidating the impact of micro-municipal administrators on local governance and stakeholders. Dougherty and Easton (2011) emphasize human resources' significance in U.S. local administrations, focusing on appointed volunteer boards' effectiveness in 274 villages. They find that management capacity significantly

influences board effectiveness, stressing the importance of a thoughtful selection process and training provided by local administrators. Pamungkas et al. (2020) investigate intellectual resources in an Indonesian village, analyzing fraud prevention models. They highlight the role of social support in officials' decisions to report fraud, emphasizing the importance of effective whistleblowing systems and culturally sensitive strategies. Liu et al. (2022) assess the public service motivation of village cadres in China, finding that it significantly influences effective garbage and sewage treatment. They advocate for strengthening cadres' motivation to protect public interests, emphasizing the crucial role of human resources in rural administration. Steenbergen's (2016) ethnographic research in Indonesia explores interactions between village administrators, local governance, and stakeholders. They highlight the mediating role of customary leaders in program success, underscoring the importance of inclusive governance and locally driven interventions for effective resource management, while recognizing the complexities within community leadership and administration.

Impact of Micro-Municipal Governance on Stakeholders

This section focuses on the relationship between micro-municipal governance and stakeholders. Zaitul et al. (2023) emphasize specific governance principles crucial for sustainable and inclusive practices, including fairness, inclusivity, legitimacy, participation, performance, transparency, and accountability. Numerous studies support the relevance of these principles in promoting inclusive and sustainable community development. The examination of the Italian initiative "Houses at 1€" by Pera (2021) provides insights into urban regeneration challenges and opportunities. The initiative aims to address depopulation and urban decay by selling abandoned properties for 1 euro, highlighting the need for tailored strategies considering local nuances. In China, improving the rural living environment is crucial. Xiao et al. (2022) evaluate local administration's role in enhancing the rural living environment, emphasizing fair policies, information transparency, and accountability. They stress the importance of considering regional differences in natural and financial endowments for effective policy design. In Indonesia, Fatimah et al. (2023) explore the regulation-making process in Rimba Sari village, highlighting communication and coordination challenges. They underscore the significance of intellectual resources and effective collaboration within village administration and consultative bodies, advocating for enhanced communication channels and coordination mechanisms for a more participatory approach to governance.

Impact of Micro-Municipal Governance on Residents

These studies collectively illuminate the relationship between micro-municipal governance and residents, uncovering various dimensions of administrative impact and identifying factors crucial for community well-being. Benito et al. (2021) and Sofyani et al. (2023) emphasize the importance of transparency in efficient governance, drawing insights from Spanish municipalities and post-reform Indonesian villages. They stress the role of transparency in building community trust and advocate for aligning transparency practices with communal norms. Zhang et al. (2019) highlight the significance of economic empowerment and formalization of informal economic activities in enhancing community resilience, based on the administration-led redevelopment of Tangjialing village. Hidayat et al. (2019) address challenges in negotiable administration in Bajo village, stressing the need for transformative changes to promote citizen engagement and overcome elitism, fostering democratic administration and citizen empowerment. Kasymova and Schachter (2014) and Annahar et al. (2023) explore inclusive administration in Kyrgyzstan and Indonesian villages, focusing on citizen involvement and participatory tools. They underscore the effectiveness of participatory tools in empowering citizens and advocate for merit-based recruitment practices and capacity building for village officials to ensure successful, inclusive governance. Beeri et al. (2019) analyze public performance management in Israeli local authorities, establishing links between performance management and citizens' perceptions of good governance, trust, and satisfaction with administration. They highlight the importance of performance management in enhancing citizen satisfaction and trust, recognizing it as a crucial tool for effective local governance.

Research limitations. As we advocate for a paradigm shift in micro-municipal administration, it is imperative to acknowledge the study's limitations. The selection criteria, though systematic, introduce subjectivity, and the interpretation of micro-municipalities may not capture the diverse nuances of local contexts. The limited number of articles, while a reflection of the current state of research, underscores the need for further interdisciplinary approaches and participatory research methods. Future research should bridge gaps by embracing cross-sectoral analyses, involving stakeholders, and addressing practical limitations. Prioritizing quantitative and qualitative approaches tailored for a network-oriented public administration will contribute to a more nuanced understanding of micro-municipal administration dynamics. This collaborative effort holds the promise of shaping more effective, responsive, and inclusive administrative structures for the evolving needs of our communities.

Managerial implications. Policy makers can enhance micro-municipal governance by implementing tailored financial policies to address issues like depopulation and unemployment. Supporting local enterprises and creating local supply chains can boost urban development. Sustainable practices should be embedded in policies, emphasizing fairness, inclusivity, and transparency, while fostering public service motivation among appointed volunteers. Facilitating resident participation in decision-making ensures effective engagement and inclusion. Aligning financial systems with local values empowers elected municipal committees, enhancing municipal autonomy. These measures collectively aid micro-municipalities in overcoming administrative challenges and promoting community well-being.

Public managers/administrators play a crucial role in efficiently managing municipal practices, particularly in urban development and collaborative initiatives. Leveraging resources strategically and formalizing collaborations with national and provincial governances is vital for sustainable economic growth. They should oversee education and training programs aimed at enhancing relationships within the network and engaging stakeholders effectively. Recognizing and involving informal community leaders strengthens local governance. Continuous improvement in transparency fosters openness and accountability, while inclusive governance practices ensure holistic information flow. Public administrators must maintain balanced and inclusive leadership, acknowledging diverse perspectives and fostering resilience. Embracing these recommendations can help cultivate a resilient, transparent, interconnected network, promoting effective governance and community well-being.

Originality of the paper. *Our framework emphasizes the needed multifaceted cooperation among identified entities influencing municipal governance. Being the first systematic literature review on this peculiar kind of governance, we provide researchers, administrators and policy makers with insights into critical issues in municipalities' governance and identify trajectories for future research.*

Un modello di governance ESG integrato per una strategia aziendale sostenibile

ILENIA CEGLIA¹ MASSIMO BATTAGLIA² NORA ANNESI³ FRANCESCO MERCURI⁴

Abstract

Le nuove direttive Europee sulla sostenibilità, quali la Corporate Sustainability Reporting Directive (CSR-D) e la Corporate Sustainability Due Diligence Directive (CSDDD), richiedono alle imprese di promuovere comportamenti responsabili nei confronti dell'ambiente e dei diritti umani e di informare gli stakeholder riguardo ai risultati economici, sociali e ambientali generati nello svolgimento delle attività aziendali. Queste direttive hanno aperto nuove sfide di sostenibilità e le aziende si trovano, quindi, a dover gestire diverse tensioni riguardanti gli impatti economici, ambientali e sociali. Lo scopo di questa ricerca è quello di identificare un modello per l'analisi e l'integrazione della sostenibilità nella strategia aziendale che consenta una governance "integrata" in grado di gestire le diverse aspettative degli stakeholder. Il presente lavoro è condotto attraverso un approccio di ricerca-azione che coinvolge una grande azienda italiana operante nel settore alimentare. La ricerca ha adottato un modello che ha coinvolto, direttamente o indirettamente, i membri del CdA e l'alta dirigenza, i clienti industriali e commerciali ed i consumatori finali. Il disegno di una strategia di sostenibilità è emerso, quindi, come valido strumento per guidare il CdA nella gestione di tutte le pressioni ambientali, sociali ed economiche. L'originalità della ricerca risiede nella creazione della strategia di sostenibilità considerando l'influenza della governance e le richieste degli stakeholder strategici. Il contributo manageriale riguarda la realizzazione del modello in grado di integrare gli obiettivi di sostenibilità nella governance aziendale, in linea con le indicazioni del Forum Economico Mondiale (2020).

Key words: ESG, ricerca-azione, modello di governance integrato, strategia di sostenibilità

Inquadramento della ricerca. *La sostenibilità è un tema di crescente importanza all'interno dei dibattiti politici con effetti importanti sul quadro normativo. La recente normativa Europea sulla rendicontazione di sostenibilità, ovvero la Corporate Sustainability Reporting Directive (CSR-D), ha come obiettivo quello di informare gli stakeholder dei risultati economici, sociali e ambientali generati nello svolgimento delle attività aziendali, secondo quanto stabilito nel Libro Verde della Commissione (2001). La normativa amplia in modo significativo il numero di imprese tenute a notificare le informazioni sulla sostenibilità, introduce obblighi di rendicontazione più dettagliati e introduce l'obbligo di attestare la conformità della rendicontazione di sostenibilità da parte di un revisore terzo. Un'altra recente normativa è la Corporate Sustainability Due Diligence Directive (CSDDD) che impone alle imprese di gestire in modo responsabile gli impatti sociali ed ambientali lungo l'intera catena di approvvigionamento. Quindi, le recenti normative sulla rendicontazione e sulla pianificazione di politiche aziendali di sostenibilità (quali, la CSR-D e la CSDDD) stanno impattando su tutti gli aspetti della vita organizzativa e le aziende stanno valutando sempre più modi per trovare un equilibrio tra creazione di valore economico, ecologico, sociale e culturale nei loro modelli di business (Clarke, 2001). Gli stakeholder sono sempre più consapevoli dell'impatto che le imprese generano sull'ambiente e sulla società e sono sempre più interessati alle prestazioni delle aziende in termini di sostenibilità rispetto alle questioni ambientali, sociali e di governance (ESG) (Khan, 2019). Alla luce di ciò, è fondamentale che la ricerca si concentri sul ruolo della governance aziendale per guidare l'adozione e l'integrazione di pratiche sostenibili (Aguilera et al., 2021) atte a rispondere alle aspettative socioculturali. Queste richieste sono spesso incompatibili e le imprese devono gestirle simultaneamente. In questa prospettiva, la teoria del paradosso inquadra i conflitti tra obiettivi economici e socio ambientali come paradossi che vengono gestiti simultaneamente (Gao & Bansal, 2013; Hahn et al., 2015) e consente l'esplorazione di diverse soluzioni per affrontare insieme le tensioni e gli obiettivi divergenti legati alla sostenibilità (Carmine & De Marchi, 2022). Partendo dalla teoria del paradosso e considerando le diverse aspettative socioculturali*

e commerciali legate alla sostenibilità creiamo un modello che possa supportare la corporate governance ad integrazione i principi ESG in una strategia di sostenibilità a lungo termine considerando gli aspetti ambientali, sociali ed economici.

In questo contesto, la corporate governance ha un ruolo centrale, perché descrive le strutture, i processi e le istituzioni all'interno e intorno alle organizzazioni che allocano il potere e il controllo delle risorse tra i partecipanti (Davis, 2005) e ha il potere di gestire in modo equilibrato le tensioni esistenti tra gli attori coinvolti, ovvero azionisti, management, Consiglio di amministrazione e dipendenti. L'integrazione dei criteri ESG e una buona governance aziendale contribuiscono alla creazione di valore a lungo termine (Kocmanová & Dočekalová, 2012), infatti, la corporate governance contribuisce non solo alla prosperità aziendale, ma anche alla responsabilità aziendale.

Con lo sviluppo dei mercati globali sono aumentate le aspettative e le pressioni degli investitori e di tutti gli stakeholder che richiedono standard più elevati di responsabilità, condotta e performance legate alla sostenibilità (Kocmanová & Dočekalová, 2012) che possono essere definiti dalla governance aziendale. La corporate governance ha un ruolo fondamentale perché è il sistema attraverso il quale le aziende vengono gestite e controllate (Kavaliř, 2005) e rispondono ai diritti e alle richieste degli stakeholder (Demb & Neubauer, 1992). La corporate governance, quindi, definisce obiettivi strategici di un'azienda, controlla la realizzazione degli obiettivi e informa gli azionisti sull'andamento delle attività (Cadbury, 1992) e per questo motivo ha un ruolo fondamentale nell'integrazione di obiettivi sociali, ambientali ed economici, spesso contrastanti tra loro, nella strategia aziendale di lungo periodo con l'obiettivo di creare valore economico e sostenibile (Kocmanová & Dočekalová, 2012). Tuttavia, data la varietà di interessi dei membri della governance aziendale, è possibile che la stessa società debba gestire anche i conflitti interni (Aguilera et al., 2021). In questo senso, è necessaria l'adozione di un "modello di governance integrato" (UNEP FI, 2014: 35) per gestire contemporaneamente le diverse questioni di sostenibilità che possono essere in conflitto tra loro.

Nonostante le recenti e fiorenti ricerche sulla teoria del paradosso, le sue applicazioni non hanno ancora pienamente incorporato una prospettiva strategica sistemica (Carminé & De Marchi, 2022) e ciò costituisce uno dei contributi alla letteratura di questo lavoro. La letteratura ha considerato principalmente la relazione tra governance aziendale e sostenibilità ambientale (Aguilera et al., 2021). Tuttavia, le applicazioni della teoria del paradosso non hanno ancora incluso pienamente una prospettiva sistemica strategica (Carminé & De Marchi, 2022), né la letteratura ha ancora sperimentato un "modello di governance integrato" alle questioni di sostenibilità (UNEP FI, 2014: 35). Lo studio presentato è stata, quindi, l'occasione per costruire un modello mirato a colmare queste lacune. Il modello sviluppato intende supportare la governance aziendale per integrare le questioni ESG, ed in questo senso fornisce una interpretazione operativa delle linee strategiche suggerite dal Forum Economico Mondiale (WEF) (2020).

Secondo il Forum Economico Mondiale (2020), una buona governance aziendale è in grado di sostenere la generazione di valore economico e il mantenimento della fiducia degli stakeholder e della società. In questa prospettiva, tale gestione dovrebbe integrare gli ESG nelle strategie a lungo termine attraverso sei aree di attenzione che sono:

1. Allineamento della strategia e dell'allocazione del capitale con i fattori di creazione di valore a lungo termine;
2. Internalizzazione dei fattori ESG materiali nella gestione del rischio d'impresa;
3. Rafforzamento della preparazione e la resilienza alle crisi e agli shock sistemici;
4. Collaborazione tra i CdA e il management per effettuare investimenti nella sostenibilità sociale e ambientale;
5. Preparazione del reporting tradizionale dell'azienda in modo integrato;
6. Adattamento dell'organizzazione, della composizione e dell'impegno del Consiglio a questi imperativi.

Le linee tracciate dal Forum Economico Mondiale devono essere considerate nel loro insieme al fine di garantire l'adozione di un modello di governo societario integrato che fornisca un sistema omogeneo in cui le priorità di sostenibilità siano pienamente considerate nel processo di creazione di valore e in cui i benefici per gli stakeholder siano assicurati in una prospettiva di lungo periodo (WEF, 2020; UNEP FI, 2014: 35).

Obiettivo del paper. Negli ultimi anni, accademici e professionisti hanno discusso dell'importanza della governance nella realizzazione di una strategia a lungo termine per garantire progressi verso un futuro inclusivo e sostenibile (Samans & Nelson, 2022) e creare valore coerente con le priorità ESG, al fine di rendere le organizzazioni più resilienti agli shock e alle crisi. Tuttavia, in letteratura mancano contributi operativi in cui il pensiero paradossale venga sfruttato come strategia per affrontare olisticamente l'integrazione della sostenibilità e per renderla parte della governance aziendale nel suo insieme (Carminé & De Marchi, 2022). La nostra domanda di ricerca riguarda cercare di capire se sia possibile creare una nuova strategia aziendale basata sui principi ESG attuati da una governance aziendale che orienti le scelte finanziarie e operative in maniera allineata alle aspettative e alle pressioni istituzionali (WEF, 2020) e degli stakeholder. Questa ricerca delinea un modello per l'integrazione della sostenibilità all'interno della strategia aziendale, volto a stimolare una governance in grado di gestire molteplici aspettative contrastanti (Carminé & De Marchi, 2022).

Metodologia. La ricerca si basa su un approccio di ricerca-azione adottato con una grande azienda italiana. La ricerca-azione (Cohen et al., 2017) comprende diverse caratteristiche, come il coinvolgimento con un'azienda, il suo processo interattivo, l'analisi dei cambiamenti nel tempo e la produzione di conoscenza scientifica. In questo processo il ricercatore entra in una situazione del mondo reale e mira sia a migliorarla che ad acquisire conoscenza (Checkland & Holwell, 2007) e ciò può contribuire alla pratica gestionale, così come al quadro teorico in cui si inquadra il problema osservato. In questo contesto, alcuni membri del Consiglio di amministrazione e top manager dell'azienda, in collaborazione con quattro ricercatori, hanno progettato la strategia basata sulla sostenibilità. I membri dell'organizzazione hanno contribuito attivamente all'analisi, lavorando con il gruppo di ricerca, in modo che i problemi potessero essere risolti e il sistema potesse essere migliorato. Da questo punto di vista, l'approccio adottato può essere profilato come un intervento in cui i ricercatori hanno raccolto le richieste, fornito risultati ed evidenze, e hanno

sviluppato il modello, mentre l'organizzazione ha fatto emergere i risultati e la strategia, dimostrando un certo approccio strategico nella governance aziendale. La ricerca-azione riguarda una impresa commerciale italiana operante nel settore alimentare. L'azienda è una società per azioni con un unico socio, fa parte di un grande gruppo europeo e in Italia dispone di due siti produttivi. L'azienda fattura circa 200 milioni di euro e conta circa 100 dipendenti. L'azienda ha ottenuto diverse certificazioni che provano l'alto livello di sensibilità verso le tematiche di sostenibilità, senza, tuttavia, aver adottato politiche, funzioni o specifici investimenti destinati. Subendo forti pressioni e richieste da parte dei propri stakeholder su tutte e tre le dimensioni della sostenibilità, l'impresa ha chiesto la collaborazione delle nostre istituzioni per iniziare il suo percorso verso l'integrazione della sostenibilità nelle sue strategie e pratiche quotidiane. In particolare, la competizione di mercato percepita ha rappresentato il primo tipo di pressione legata alla dimensione economica, le crescenti aspettative dei consumatori hanno delineato la pressione sociale, mentre la legislazione ha contribuito a stimolare l'organizzazione a definire un'integrazione olistica dei principi di sostenibilità, compresi gli aspetti ambientali.

Il disegno di ricerca prevedeva sette passaggi implementati in dieci mesi. La prima fase ha riguardato l'inquadramento del problema attraverso i dialoghi preparatori tra i ricercatori e i responsabili marketing e HSE, che sono stati responsabili del progetto, per comprendere lo scopo della collaborazione.

Nella seconda fase i ricercatori hanno implementato una revisione non sistematica della letteratura volta a identificare le tendenze del business riguardo all'integrazione delle questioni di sostenibilità a livello strategico e operativo. La revisione è stata condotta da due ricercatori e i risultati sono stati discussi con gli altri due ricercatori al fine di condividere dubbi, ridurre errori o ridondanze. Il risultato finale di questa fase è stata una lista composta da cento domande che valutavano il livello di maturità dell'azienda. La check list indaga dieci aree strategiche: innovazione sostenibile nel ciclo di vita del prodotto, sostenibilità degli imballaggi, etica e sostenibilità nella Supply Chain Management, politiche e pratiche di sostenibilità, etica nella gestione del personale e tutela dei diritti umani, gestione energetica e cambiamento climatico, gestione dei rifiuti, gestione delle risorse idriche, strategie di marketing e comunicazione, e infine, contributo alle comunità locali. La check list è stata, inoltre, discussa con i responsabili interni del progetto, per identificare eventuali integrazioni o per standardizzare le terminologie.

La terza fase ha riguardato la raccolta dei dati che è avvenuta grazie alle interviste che i ricercatori hanno condotto con dodici rappresentanti della Società. Quattro di loro erano membri del CdA (presidente, vicepresidente e due membri del CdA) e otto erano top manager (Amministratore delegato, Direttore generale, Manager delle risorse umane, Responsabile della catena di fornitura, Responsabile HSE, Responsabile del controllo qualità, Marketing Manager e Direttore delle vendite). Le interviste sono state effettuate sulla base di protocolli semi-strutturati finalizzati ad approfondire gli argomenti elencati nella check list e a identificare i rischi e le opportunità percepiti nell'implementazione di una strategia basata sulla sostenibilità. Ogni intervista è stata registrata e successivamente trascritta. Ciascuna trascrizione è stata, poi, validata dall'intervistato.

Nella quinta fase i ricercatori, i manager e i membri del CdA hanno lavorato insieme per identificare i clienti strategici. Analizzando tutti i canali di divulgazione disponibili (siti istituzionali, social network e, ove possibile, bilanci di sostenibilità), i ricercatori hanno individuato i temi prioritari per trenta clienti strategici dell'azienda che si occupano di sostenibilità. La selezione della clientela ha riguardato sia imprese industriali che commerciali, in particolare, diciotto imprese industriali e dodici commerciali. Il risultato finale di questa fase è stato un elenco di priorità dei clienti basate sulla sostenibilità.

Nella sesta fase sono stati coinvolti i consumatori finali, per raccogliere informazioni sulla loro percezione di sostenibilità e consumo responsabile. Questa ricerca è stata finalizzata ad analizzare le tendenze future rispetto ai temi legati alla sostenibilità. Ha coinvolto 1.005 consumatori. Il risultato è stato una descrizione della segmentazione della domanda, con un focus particolare sul ruolo dell'etica e della sostenibilità nelle preferenze di acquisto.

Questa analisi ha aiutato i ricercatori a identificare le potenziali aree di miglioramento mirate nella gestione delle pressioni complessive.

Infine, nell'ultima fase, i ricercatori, in stretta collaborazione con il direttore generale, il direttore marketing e il vicepresidente del CdA, hanno delineato una serie di obiettivi strategici volti a collegare tutti i risultati emersi dalle analisi sia interne che esterne. Tale proposta, denominata "strategia aziendale basata sulla sostenibilità" è stata elaborata secondo i pilastri ESG e la visione aziendale e, poi, presentata e condivisa nel CdA.

Risultati. Il metodo descritto ha portato alla progettazione di un modello per l'integrazione sistematica delle tensioni di sostenibilità che l'azienda deve affrontare nella sua gestione. La strategia è stata concepita come un insieme di iniziative a lungo termine. Nei prossimi anni l'impresa dovrebbe agire per l'adozione di queste iniziative considerando costantemente l'insieme dei suggerimenti emersi. Per quanto riguarda i contenuti complessivi della strategia, in sintesi, le principali iniziative rilevanti possono essere suddivise nelle tensioni legate alla sostenibilità sociale, ambientale ed economica che vengono spiegate di seguito, in dettaglio.

Le tensioni legate alla dimensione sociale sono state rilevate durante le interviste con i membri dell'impresa, nonché attraverso la consultazione dei consumatori. Come descritto, parte delle tensioni sociali erano legate alle aspettative dei consumatori riguardo al rispetto dei diritti sociali delle comunità locali e alle condizioni di lavoro dei dipendenti.

In particolare, il CdA si è concentrato principalmente sui dipendenti e sulle comunità locali. La valorizzazione delle potenzialità delle risorse umane è stata affrontata dalla strategia attraverso la definizione di specifiche linee dedicate all'apprendimento continuo dei dipendenti e l'adozione di sistemi di valutazione del personale, anche considerando l'impegno del lavoratore nell'acquisizione di nuove competenze o conoscenze.

Un'altra area di debolezza emersa dalle interviste era relativa ai rapporti con le comunità locali. Nella strategia sono emerse linee volte a promuovere una consultazione della comunità in cui l'impresa opera per rilevare aspettative e bisogni. In questa prospettiva è emersa come rilevante l'esigenza di un rapporto più stretto con le istituzioni locali, nonché di un più stretto collegamento con le associazioni dei cittadini. Azioni filantropiche e di collaborazione con le scuole locali per promuovere iniziative di formazione e tirocinio hanno rappresentato le proposte più rilevanti.

Le testimonianze dei clienti hanno sottolineato l'importanza di prestare attenzione al controllo etico delle catene di fornitura, con particolare attenzione alle condizioni di lavoro dei fornitori. In questa prospettiva la strategia fa riferimento all'adozione di una procedura di selezione dei fornitori basata su sistemi di controllo che includano criteri sociali e ambientali nell'ambito dei processi di accreditamento.

Per quanto riguarda le tensioni legate alla dimensione ambientale, esse si sono concentrate principalmente su questioni legate all'energia e alla catena di fornitura. Per quanto riguarda l'energia, è stato proposto un piano di ammodernamento degli edifici volto ad aumentare l'efficienza energetica.

Per quanto riguarda la gestione della catena di fornitura, ancora una volta, sia i clienti B2B che i consumatori, hanno sottolineato l'importanza dell'implementazione di sistemi di controllo della sostenibilità sui fornitori di beni (come audit di seconda parte), al fine di garantire la tracciabilità e il profilo verde dell'intera catena di fornitura.

Infine, sempre nell'ottica della logistica, la strategia si è concentrata sul miglioramento dell'efficienza del trasporto degli alimenti attraverso l'utilizzo dei treni come principale mezzo di trasporto.

Infine, le tensioni legate alla dimensione economica hanno riguardato soprattutto la competizione di mercato. Secondo la strategia proposta, la definizione di pratiche più sostenibili dovrebbe essere la base di un piano di comunicazione volto a costruire un branding di sostenibilità sociale e ambientale.

La strategia di comunicazione dovrebbe valorizzare, ad esempio, il raggiungimento delle Dichiarazioni Ambientali di Prodotto (EPD), sottolineando il rigore scientifico adottato nel calcolo degli impatti prodotti lungo l'intero ciclo di vita (prospettiva LCA). L'impegno complessivo verso una corretta comunicazione sulle strategie adottate dovrebbe rivolgersi a quell'89% dei consumatori che dichiarano di essere disposti a spendere di più per una confezione in materiale riciclato.

Limiti della ricerca. Sebbene la ricerca abbia un approccio strategico e fornisca un modello interessante, è ancora in una fase iniziale e necessita di ulteriori verifiche di efficacia, che dovranno essere valutate nel medio termine. In questa prospettiva, per mantenere un miglioramento continuo, sarebbe interessante verificare gli effetti di lungo termine dei piani delle aziende, per monitorare la crescita del loro contributo agli obiettivi di sostenibilità, misurando gli indicatori ESG nel tempo. Pertanto, si potrebbe condurre uno studio longitudinale. Gli effetti del modello implementato potrebbero, infine, essere testati osservando le dinamiche finanziarie o l'evoluzione dell'indice di fiducia dei consumatori avvenuta dopo l'integrazione del modello stesso.

Implicazioni manageriali. Il modello aziendale integrato proposto offre alle aziende un quadro per integrare una strategia sostenibile che soddisfi le richieste degli stakeholder e massimizzi il valore sociale. Incorporando i principi ESG, come quelli che emergono dal nostro modello, le aziende possono affrontare le molteplici sfide legate alla sostenibilità. In quest'ottica, la ricerca contribuisce alla comprensione della teoria del paradosso per esplorare come le organizzazioni possono sviluppare strategie per affrontare le diverse tensioni che sono legate alla sostenibilità aziendale simultaneamente (Carmine & De Marchi, 2022). Inoltre, il modello proposto consente di navigare nella complessità della sostenibilità e di promuovere un approccio olistico all'integrazione della sostenibilità nella governance aziendale, che manca in letteratura (Fineman, 1997; Friedman, 1992; Lee & Rhee, 2007; Rothenberg, 2007).

Da un punto di vista gestionale, il modello aiuta a valutare l'attuale livello di sostenibilità aziendale e a guidare lo sviluppo di strategie di sostenibilità a lungo termine basate sui principi ESG. Supporta, inoltre, la predisposizione dell'informativa societaria in linea con la nuova EU CSRD, combinando il reporting con le informazioni sui rischi e sulle opportunità ESG. Si tratta, inoltre, di un primo supporto nello sviluppo di approcci innovativi di governance finalizzati alla gestione etica della catena di fornitura, in conformità a quanto suggerito dal CSDDD. Il modello fornisce un quadro per le iniziative future e aiuta le organizzazioni ad allineare i propri obiettivi interni con gli obiettivi di sostenibilità.

Originalità del paper. La nostra ricerca si concentra sulla proposta di un modello di governance aziendale integrato che delinei una strategia d'azione per integrare e rafforzare il valore sostenibile a lungo termine per gli azionisti e gli stakeholder. Il modello sottolinea l'importanza di dare priorità ai principali stakeholder del mercato, come clienti e consumatori, e cerca di prevedere e bilanciare le tensioni legate alla sostenibilità.

Aderendo alla teoria del paradosso, è fondamentale riconoscere che i meccanismi di governance sono generalmente contraddittori, poiché sono alle prese con la sfida di conciliare gli elementi incentrati sugli azionisti e quelli incentrati sugli stakeholder. Poiché le pressioni descritte agiscono sulle aziende in relazione alla loro dimensione e non in relazione al loro settore, il modello presentato può essere applicato ad altre organizzazioni che si trovano ad affrontare gli stessi obblighi legislativi.

Il nostro approccio prevede, quindi, un modello di Corporate Governance Integrato che si può riassumere nella seguente figura.

Figura 1 - Modello di Governance ESG Integrato

Does female corporate leadership improve environmental performance? A systematic literature review.

MARIA ROSA DE GIACOMO¹ MARCO FREY²

Abstract.

A part of the management literature has paid attention to the effects of governance mechanisms on business performance. Among the governance aspects investigated, gender diversity can be mentioned. In addition to financial performance, the attention to sustainable performance – the ability of organizations to achieve their business and create value, considering long-term economic, environmental, and social responsibility – has gained even more importance in the business sector. However, a limited part of the literature explores the effects of female leadership on sustainable performance at a business level, specifically on the environmental dimension of performance. Understanding the effects that female corporate leadership may have on the environmental performance of organizations is pivotal, considering two aspects: i) the relevance of improving gender balance at the societal and business level and ii) the impact that environmental challenges will have on corporate strategies.

This paper presents ongoing research based on a systematic literature review. The aim is to elucidate the current research on corporate female leadership and the effects on environmental performance at a business level. The review also aims to identify existing literature gaps and offer opportunities for further research. The preliminary findings of our review, based on a sample of 128 articles, indicate an increasing recent interest in the research on these topics. Moreover, most studies show a positive relationship between corporate female leadership and environmental performance at a business level. The existing literature identified multiple reasons that explain why gender diversity in top management positively affects the environmental performance of organizations.

We aim to identify some opportunities for further research on this topic, such as exploring the relationship between corporate female leadership and environmental performance more qualitatively and measuring the effects on single components of environmental performance. Additionally, further examination of the role that a critical mass of women on the board has in the relationship is encouraged.

This review contributes to understanding the role that a higher level of gender balance in companies may have in improving environmental performance at a corporate level, providing valuable insights to inspire future studies and to inform managers and policymakers.

Keywords: *Female Corporate Leadership, Environmental Performance, Female on Board, Review.*

Framing of the research. *Sustainable performance has gained even more importance in business (Al-Abbadi and Abu Rumman, 2023). The literature highlights that corporate governance should be pivotal in achieving better performance, which is also confirmed for sustainability performance (Khan and Ghouri, 2022). There is an increasing research interest in topics such as the role of women at the corporate level (Terjesen and Singh, 2008; Baker et al.; 2020; Green and Homroy, 2018) and the effects that women in business may have on performance (Yang et al., 2019; Khatib et al., 2021; Arora, 2022). Moreover, the literature also pays even more attention to the role that females in business may have on corporate social responsibility performance (e.g., Hyun et al., 2022; Bose et al., 2022), “in line with the triple bottom line approach, based on economic, social, environmental aims.*

In this framework, the importance of the environmental dimensions of sustainability (and the related performance) at a business level is also particularly crucial. Environmental challenges related to climate change and the need for a net-zero transition, biodiversity preservation, or improving energy efficiency are only some sustainability challenges that require concrete actions and strategies from companies. At the same time, national, European, and international policymakers are increasing their attention to environmental issues and how companies must address them.

Purpose of the paper. *Recent research has highlighted the importance of exploring corporate governance mechanisms to understand their effects on sustainable performance at a business level (Chijoke-Mgbame et al., 2020; Harjoto and Jo, 2011; Shaukat et al., 2016). Management scholars are even more interested in understanding whether and how corporate female leadership influences sustainability performance at a company level, especially the*

environmental performance dimension of businesses. At the same time, we do not find any systematic literature review (SLR) on the relationship between corporate female leadership and the environmental dimensions of sustainable performance.

The aim of the review is to understand the main existing findings in the academic debate on the relationship between corporate female leadership and the environmental performance at a business level. Moreover, we aim to shed light on what are the main gender diversity dimensions explored by the literature and the environmental performance aspects considered.

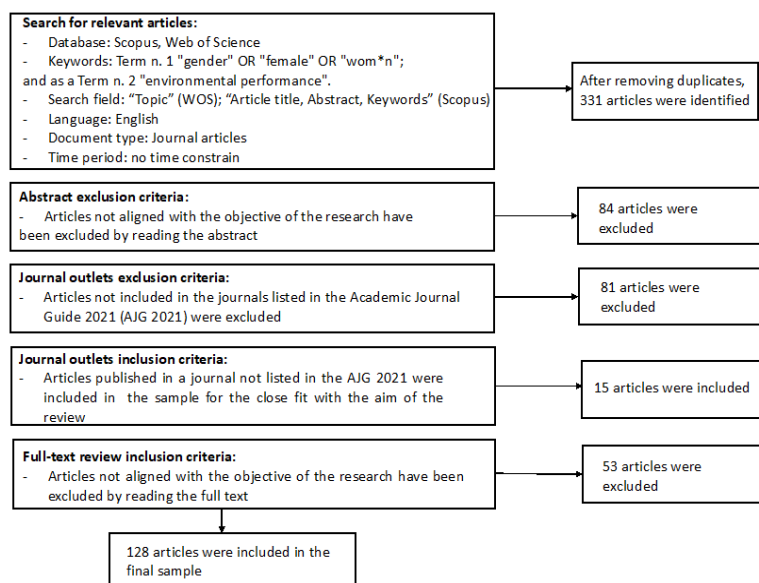

This review is based on a broad definition of environmental performance, including, for example, an ameliorate performance at a business level on waste management, on CO2 emissions, on environmental innovation, on environmental disclosure, or on the sustainability of supply chain, or on environmental-friendly products, processes or services, for example.

Methodology. We adopt a systematic literature review (SLR) methodology to review the existing literature on the relationship between female corporate leadership and environmental performance. SLR is considered a rigorous method, and it can produce reliable knowledge (Tranfield et al., 2003) and ensure a comprehensive account of the literature (Rosseau et al., 2008). It provides both the research design's replicability and the review process's transparency.

The SLR we adopted in this study has been based on two central databases, Scopus and Web of Science (WOS), "as they are considered complete databases (Linnenluecke et al., 2020) because they cover a high number of fields and ensure a wide range of articles. A set of keywords was used in the search title "Topic" for WOS and in "Article title, Abstract, Keywords" for Scopus to ensure all relevant articles were included in the research, including as term n. 1 "gender" OR "female" OR "wom*n"; AND as a term n. 2 "environmental performance". To do a comprehensive review, we decided not to limit the timeframe of the research. Therefore, the SLR is updated to the 26th of January 2024, when the data collection on the two databases has been completed. The research allowed us to select 331 (excluding duplicates extracted from the two databases). With the aim to reduce the risk of bias, all abstracts have been read by two researchers to see if the articles aligned with the review's scope. The research team has been trained for that specific task. To that purpose, 20 articles have been assessed by two researchers to test any alignment or misunderstanding on the review protocol and criteria. After that, the main findings were discussed in the research team to see any inconsistencies and define the correct process to follow before proceeding with the review of the other articles of the sample. That process allowed us to exclude 84 articles. Then, to ensure a high quality of business and management studies, we decided to focus our review on articles published in the Academic Journal Guide 2021 (AJG). The AJG's ratings are based upon peer review, editorial and expert judgements following the evaluation of hundreds of publications, and they are informed by statistical information relating to citations. The AJG is distinctive in that, unlike other journal ratings, it is not based purely on a weighted average of journal metrics. Instead, the AJG is informed by metrics. The ratings of journals reflect the outcomes of consultations carried out by the subject experts of the Scientific Committee with expert peers and scholarly associations as to the relative standing of journals in each subject area (Chartered Association of Business Schools, 2024).

Moreover, we decided to add articles published in the Sustainability journal as those studies aligned with the review's objective – even if that journal is not listed in AJG. Then, 181 full-text articles were read to examine their alignment with the objective of the review – that is, to explore the relationship between corporate female leadership and environmental performance at the business level. As a result of the full-text reading, 53 have been excluded. Therefore, the final sample of this SLR consisted of 128 papers. The steps of article selection are described in Figure n. 1.

Figure 1 Systematic literature review process.

Source: our elaboration

The research team used a shared spreadsheet to categorize the articles based on some information, such as year of publication, journal outlet, kind of research method used, gender leadership dimension considered, environmental performance dimensions considered, and the nature of the relationship between the corporate female leadership and the environmental performance. Other information will be categorized in the coming weeks as this project is ongoing.

Building upon this list, the research team conducted a qualitative analysis by coding the relevant information and data from the articles' text. The coding process has been discussed with the research team, and the coding has been reviewed and assessed more times to check for errors and inconsistencies.

Results

Descriptive analysis.

Time frame, journals and research methods.

The research area on the effects of corporate female leadership on environmental performance at a business level has been receiving increasing attention among scholars in the last few years, as demonstrated by Figure 2. More than 40% of the sample papers have been published very recently, in 2023, and around 20% in the previous year, in 2022. We have to consider that in 2024, there are four papers in the sample that refer to the time of data collection (end of January 2024). It is also worth noting that until 2018, the topic was not explored extensively in the literature.

Figure 2. The timeframe of the sample articles

Source: our elaboration

The increasing scientific community's attention on the relationship between corporate female leadership and environmental performance at a business level is also shown by the wide range of journals interested in this kind of research. Indeed, the 128 papers of the sample have been published in 48 diverse journals (Table 1). The most relevant journals for the topic of this review are *Business Strategy & the Environment*, *Corporate Social Responsibility and Environmental Management*, and *Sustainability*.

Source: our elaboration

Regarding the method adopted by the papers, most articles (around 91%) use a quantitative method to analyze the relationship between corporate females and environmental performance at a business level. Only 2% used a qualitative approach, while the remaining part (7%) adopted a mixed approach based on both qualitative and quantitative methods.

The corporate female leadership: what aspects have been considered?

We found in our sample that multiple dimensions of corporate female leadership have been explored, such as the presence of females on board, the female CEO, or the presence of females in other top management roles. Most analysed studies focused on the female board of directors' dimension (around 80% of the papers). Another part of the papers considers both females on board and females in top management aspects in the same study (10% of the sample's studies), "while a minor part of the sample investigated the female in the top management dimension (9%), "or the female on board and female advisors' dimensions together in the same study (one single paper).

The environmental performance: what aspects have been considered?

There are multiple variables that the 128 papers have been used to measure environmental performance.

We include a summary of environmental performance dimensions based on our elaboration and some examples in Table 2:

Table 2. The environmental performance dimensions

Environmental performance: dimensions	Examples
Indexes/ratings used as proxies of the environmental performance	<ul style="list-style-type: none"> - Indicators of the Global Reporting Initiative (GRI) - Indexes of the Refinitiv Eikon database - Carbon Disclosure Project (CDP) score - Thomson Reuters ESG score - Thomson Reuters ASSET4 environmental pillar - ENVIP, environmental disclosure index - Sustainalytics, environmental performance score - MSCI ESG STATS - VigeoEiris environmental score

More environmental aspects	More environmental aspects among those indicated above are considered together

Source: our elaboration

To summarize, we found a broad representation of different variables and measures that have been analysed in the papers to represent environmental performance. Moreover, sometimes, we found that within a unique paper, multiple dimensions of environmental performance have been explored. In the case of indexes and ratings used as a proxy of

environmental performance, for example, the effect of corporate female leadership is examined with reference to multiple dimensions of the environment. The limit is that it is not possible to isolate that effect based on the single environmental measures and variables that compose the indexes.

Thematic analysis: the relationship between corporate female leadership and environmental performance.

The review shows that most of the analysed studies found a positive relationship between corporate female leadership and environmental performance at a business level. Specifically, 70% of studies argued that female leadership positively affects the environmental dimensions investigated. The investigated studies reported multiple reasons explaining the positive relationship between the two variables. For that reason, we categorized qualitatively the main motivations that the analysed papers included to explain the positive effects of corporate female leadership on environmental performance in some components: 1. High engagement of women in communication and disclosure (and/or in higher quality disclosure and reporting); 2. High sensitivity or commitment of women towards risks, environmental issues, ethical or social aspects, and more ethical behaviour; 3. The capacity of women to define relationships with the relevant community of stakeholders or to defend the interests of the relevant community and stakeholders, and other capacities of females in doing networks; 4. Women are more inclined towards environmental innovation; 5. Women can promote diverse perspectives or experiences and knowledge on board and have the capacity to take a leadership role in Corporate Social Responsibility (CSR) aspects; 6. Women have specific useful competencies, such as experience and, knowledge, and resources.

Some studies (16% of the sample) found a mixed relationship. Twelve percent of the analyzed papers do not find any effects of female leadership on environmental performance, while only a minor part of the sample (2% of the papers) found a negative relationship between women's leadership and environmental performance.

Expected results and suggestions for future research.

As the review is an ongoing process, we aim to analyse if investigated studies paid attention to the role that the presence of a critical mass of women leadership (e.g., the presence of a critical mass in the board) have in explaining the relationship between corporate female leadership and environmental performance. In any case, future research on this topic may explore more in-depth that aspect.

We will also explore if there are differences between females on board and another female leadership role (e.g., females in other top management roles) in the relationship with environmental performance.

As preliminary findings of our review highlighted, the sample of papers is mainly based on quantitative methods, future researchers may explore the investigated topic more extensively using qualitative approaches, such as case studies (Eisenhardt, 1989).

Research limitations. The review aims to study the relationship between corporate female leadership and a specific dimension of sustainable performance, the environmental one. This study does not deeply explore the other dimensions of sustainability, namely, the economic and social ones. Our main findings are thus only generalizable to some dimensions of sustainability performance. For those reasons, the replication of the review for social and economic dimensions of sustainability performance would be suggested.

Moreover, the review is based on a qualitative analysis of the sample of papers. A review of the effects of corporate female leadership on environmental performance based on different methods, i.e., on quantitative methodologies, can be carried out.

Managerial implications. The study has some important implications for companies and policymakers. Our review shed light on the effects of female corporate leadership on environmental performance. Most analysed papers highlighted that women in leadership roles positively impact companies' environmental performance. Understanding that a higher level of gender diversity representation in the top management has positive effects at the business level may encourage companies to promote gender diversity in their organizations. Managers should also focus more on specific governance strategies and mechanisms to address environmental issues. Moreover, our findings may interest legislators and regulators in considering setting quotas or incentivizing organizations to increase their gender diversity.

Originality of the paper. The review makes an original contribution to the literature on corporate governance and sustainability performance, as well as to the studies exploring female leadership's role in businesses. While extant similar reviews have mainly focused on the effects of female leadership on financial performance, to the best of our knowledge, no review exists on the impact of female corporate leadership on the specific environmental dimension of sustainable performance. Moreover, we offer a comprehensive review that analyses and synthesizes previous literature on the effects of female corporate leadership on environmental performance at a business level. Our review can stimulate novel research questions and aspects to be explored in that research area.

Our study also enables us to appreciate governance aspects and their effects at the intersection between the social dimensions (i.e., the gender aspects) and the environmental dimensions (i.e., environmental business performance) of sustainability.

The Geography of Innovation: The Phenomenon of Urban Clustering in the Fashion Industry

ALESSIO TRAVASI¹ FABIO MUSSO²

Abstract

The geography of innovation underscores the importance of open innovation and spatial proximity in fostering collaboration. This paper explores the geography of innovation in the fashion industry through the analysis of a selection of papers focused on urban clustering in the fashion industry. A systematic search and thematic coding process using R software were employed. Findings reveal key insights into coordination, proximity, networks, entrepreneurship, and innovation dynamics in the fashion sector, highlighting the emergence of distinct clusters. Despite limitations like potential selection biases and language focus, the research offers valuable managerial implications. By leveraging geographic factors, firms can enhance competitiveness, while policymakers can support innovation and cluster growth. The paper's contribution lies in its comprehensive analysis of the fashion industry's innovation geography and its actionable insights for industry and policy. Through this research, a deeper understanding of the interplay between geography and innovation in the fashion industry is elucidated, providing a foundation for strategic decision-making and policy formulation in this dynamic sector.

Key words: *Geography of innovation; Urban clusters, Fashion industry; Spatial proximity; R, Content analysis.*

Framing of the research. *Much has already been written about the geography of innovation. One of the first scholars to study this topic was Marshall (1920), describing the way in which firms in Britain's industrial districts shared knowledge and know-how with each other in order to develop highly innovative products. In the following years, the topic experienced a new lease of life from the 1980s onwards thanks to the work of Piore and Sabel (1984), later to include many other concepts such as learning regions (Florida, 1995), clusters (Porter, 2003) and regional innovation systems (Cooke, Heidenreich & Braczyk, 2004). What links all these ideas is the notion that innovation depends on the activities of acquiring information and knowledge from external sources. These activities fall under the definition of "open innovation", defined as the umbrella that encompasses, connects, and integrates all information and knowledge acquisition activities (Chesborough, 2003). Economic geography today falls under this umbrella. More specifically, the multitude of concepts and ideas that associate innovation with local, or even extra-local, interaction have been brought together under the paradigm of "open innovation" (Shearmur, 2015).*

Thus, when we talk about the geography of innovation, we refer to the fact that firms innovate in an open context, within which proximity between the actors involved is crucial for successful collaboration (Boschma, 2005). Based on this definition, and by extension, the geography of innovation is often interpreted as the geography of proximities (Carrincazeaux, & Coris, 2011). These proximities can be social, organizational, or cultural (Cooke & Asheim, 2011) and can be of permanent or temporary duration (Torre & Rallet, 2005). Indeed, the geography of innovation has become the geography of the networks that support these proximities, and there is also a burgeoning field of research that focuses on the ways in which the advent of the Internet, the easier and faster means of transport, and the emergence of international inter-organisational networks contribute to the exchange of information and innovation even among actors who are not geographically close to each other (Moriset & Malecki, 2009; Bathelt, 2011; Glücker, 2011; Musso & Caraganciu, 2021).

In general, the most important conclusion of these research is that innovation takes place in clusters, much more often in urban areas, which are important transport and communication hubs able to foster not only the emergence of non-geographical proximities (Bathelt, Malmberg & Maskell, 2004) but also the internal dynamics of knowledge exchange, chance encounters, and specialized knowledge spillovers (Porter, 2003). More specifically, Glaeser (2011) theorizes that innovation occurs in "creative cities" embedded in larger metropolitan areas. Following this pattern, cultural industries tend to concentrate in cities while high-tech industries tend to cluster in the immediate vicinity. This seems to be further

¹ University of Urbino
e-mail: a.travasi@campus.uniurb.it

² University of Urbino
e-mail: fabio.musso@uniurb.it

confirmed by the fact that, according to Acs et al. (2002), patents and new products are most likely to be conceived within large metropolitan areas.

However, this does not exclude the possibility that innovation may also take place outside of large metropolitan areas. Cook (2011) states that innovation can also occur in areas that are not particularly well connected, and the explanations for this phenomenon can be of various kinds: local knowledge, through which firms innovate, may be difficult to share; or innovation may be linked to specific natural resources that are exclusively present in a specific area. In any case, it is important to stress that in the current literature these examples continue to be the exception rather than the norm. Thus, the innovation landscape remains largely influenced by the processes that take place within the clusters represented by urban areas, which facilitate the exchange of information and know-how of enterprises.

Purpose of the paper. Given the above literature, an increasing number of researchers have attempted to study the geographical dimension of innovation and its implications for economic clustering. However, this literature seems to have focused excessively on clusters of small and medium-sized firms in high-tech industries, leaving aside other industries in which the geographical component plays an important role, such as the fashion industry.

This paper aims to address the gap in literature by investigating the factors shaping the geography of international production in the fashion industry. Specifically, it seeks to analyze a selection of studies focused on the dynamics of innovation and economic clustering within the fashion sector, with specific reference to urban clusters. By synthesizing existing research, the paper aims to provide insights into how geographic factors influence innovation processes in the fashion industry and explore future perspectives on this topic.

Methodology. The research methodology employed in this study involved a systematic approach to identify relevant literature and analyze its content. English-written publications only were included in the research, excluding *ad priori* papers written in other languages.

Firstly, a comprehensive search was conducted using Scopus database, employing three primary keywords: "geography," "innovation," and "urban cluster", independently from the year of publication. This initial phase resulted in ninety-eight publications.

In the subsequent phase, the papers were subjected to an initial screening process to ensure relevance to the research topic. This involved examining the titles and abstracts of the papers to identify those that potentially addressed the geography of innovation within the fashion domain. In particular, the ninety-eight publications underwent a detailed evaluation to determine their suitability for inclusion in the study. This involved a thorough examination of the full text of each paper to assess its alignment with the research objectives and the depth of its analysis on the geography of innovation in the fashion industry, removing all the papers that did not contain the following words in their title and/or text: "fashion", "apparel", "textile", and "garment". A final set of eight publications was identified as meeting the inclusion criteria. These papers were deemed to provide valuable insights into the geographic factors influencing innovation processes within the fashion industry and formed the basis for the subsequent analysis.

To analyze the content of the selected papers, thematic coding was performed using R software. This involved systematically categorizing the content of each paper into thematic areas related to the geography of innovation in the fashion industry. By dividing the content into thematic areas, this approach facilitated a structured and comprehensive analysis of the key findings and insights presented in the literature. Additionally, it allowed for the identification of common patterns, trends, and discrepancies across the selected papers, enhancing the validity and reliability of the research findings.

Overall, the methodology employed in this study aimed to ensure a rigorous and systematic approach to the identification and analysis of relevant literature on the geography of innovation in the fashion industry. Through a combination of comprehensive literature search, rigorous screening, and thematic coding, this approach facilitated the extraction of valuable insights and the generation of meaningful conclusions to contribute to the existing body of knowledge on this topic.

Results. The main findings, which are partly common to all papers, can be summarized in five main points: i) coordination, structure, and control; ii) proximity, location, and environment; iii) flow and connections; iv) enterprise and entrepreneurship; and v) innovation and knowledge.

The first point - i) coordination, structure, and control - refers to the challenges encountered by firms when operating in diverse geographical areas. Specifically, companies are confronted with the task of determining not only where to establish their operations but also the appropriate scale associated with them. Historically, these considerations were heavily influenced by the need to maintain control over production quality and efficiency, leading fashion firms to position their production facilities in close proximity to their headquarters. This approach was prevalent across all companies, whether haute couture or specializing in lower-quality garments. However, the landscape has shifted with the rise of fast fashion and the ubiquity of the Internet, facilitating greater control over production activities. On one hand, companies have streamlined their production processes to accommodate the demand for numerous collections each year. On the other hand, advancements in technology have diminished the significance of geographical constraints on production facilities, thanks to the simplicity and accessibility of new media platforms. For instance, the Inditex group, owner of the Zara brand, made strategic decisions to relocate some of its manufacturing plants from their traditional base in the Iberian Peninsula to countries like Morocco, Turkey, and Vietnam. This move capitalized on lower labor costs in these regions without compromising on quality or production speed (Tokatli, 2008).

The second point - ii) proximity, location, and environment - delves into the presence of other actors directly or indirectly associated with the company within its operational sphere. This encompasses not only competitors and consumers but also collaborators, suppliers, and various governmental or non-governmental bodies. These actors have

the potential to generate positive externalities for the company and foster the emergence of informal networks, both of which can spur innovation. This dynamic is exemplified in the world's renowned fashion hubs such as New York, Paris, and Milan (Power & Hauge, 2008), where the concentration of diverse stakeholders fuels creativity and growth. Similarly, cities like Istanbul (Olcay, 2013) and Auckland (Weller, 2014) demonstrate how the presence of major retailers (in the former) or a multitude of small and medium-sized textile firms (in the latter) contributes to the establishment of vibrant fashion clusters. These environments provide fertile ground for the inception and evolution of innovative ideas within the fashion industry.

The third point - iii) *flown and connections* - is intricately linked to the preceding discussion. These interconnected networks have the capacity to generate positive externalities, reverberating their effects across other geographical regions where the company operates. This presents the tangible prospect of fundamentally altering the production processes not only within the company itself but also within the broader network of associated enterprises within the same geographic vicinity. For instance, regions like Morocco and Turkey, notably Istanbul as mentioned earlier, exemplify this transformative phenomenon. Once simple industrial districts, they have evolved into veritable hubs of textile experimentation. Here, the expertise of the "parent" company is disseminated to, and reciprocally influenced by, its subsidiaries - a concept often termed as "reverse innovation." This paradigm shift, wherein the "bottom of the pyramid" emerges as a wellspring of innovation, is driven by organizational dynamics and the overarching corporate culture instilled in the region by major enterprises (Olcay, 2013; Tokatli, 2008)

The fourth point - iv) *enterprise and entrepreneurship* - addresses the pivotal role that small and medium-sized enterprises (SMEs) play in fostering the growth of a particular region. SMEs possess the capability to significantly influence regional development, yet they are also molded by the specific circumstances they encounter, particularly when a large enterprise chooses to establish a production center within their operational sphere. This scenario can give rise to two diametrically opposed conditions: a surge in entrepreneurial activity, as observed in instances such as Morocco and Turkey; or a decline in entrepreneurship. It is noteworthy that the latter scenario is more of an exception rather than a prevailing trend. In the majority of cases, the relocation of a major corporation to a particular area, especially if it is economically underdeveloped, results in a surge in entrepreneurial endeavors (Olcay, 2013; Tokatli, 2008).

The fifth and final point - v) *innovation and knowledge* - delineates the pivotal role played by specific urban areas, both in economically advanced and developing nations, in shaping innovation due to their inherent attributes. For instance, metropolises like New York, Los Angeles, and Montreal serve as epicenters where the rich amalgamation of art, culture, and social dynamics acts as a potent catalyst for innovation across the spectrum of the fashion industry, from designers to marketing agencies (Currid & Williams, 2010; Hauge & Hrac, 2010). Crucially, it's not merely the direct or tangential actors associated with the fashion industry - as elucidated in point ii) - but also the socio-cultural milieu within which these companies operate. In an industry profoundly invested in the pursuit of beauty and status symbols, environments such as Manhattan and Hollywood represent fertile grounds for growth and future development. These are locales steeped in accumulated knowledge, where experimentation flourishes, consequently fostering innovation (Rantisi, 2002; 2010). Conversely, in developing countries, the focus shifts from stylistic innovation to industrial innovation, emphasizing the quest for novel and more efficient production methodologies, as delineated in point iii).

The collective insights from the reviewed papers highlight several key factors crucial for understanding the dynamics of the fashion industry within various geographical contexts. Firstly, the paradigm of "coordination, structure, and control" elucidates the evolving strategies of firms in managing production operations across diverse locations, emphasizing the increasing flexibility afforded by technological advancements and global connectivity. Secondly, the significance of "proximity, location, and environment" underscores the role of vibrant fashion hubs in nurturing creativity and fostering collaboration among diverse stakeholders, thereby catalyzing innovation. Thirdly, the concept of "flown and connections" emphasizes the emergence of interconnected networks that facilitate knowledge exchange and innovation diffusion, particularly evident in regions undergoing rapid industrial transformation. Fourthly, the interaction between enterprise and entrepreneurship underscores the impact of major corporations on regional development, often stimulating entrepreneurial activity in economically underdeveloped areas. Lastly, the critical role of innovation and knowledge accentuates the influence of socio-cultural milieus on shaping innovative practices, both in established fashion capitals and emerging industrial centers.

These results show that two different types of economic clusters are being created in the fashion industry, each specializing in a different type of innovation, underscoring the complex interplay between geographical, economic, and socio-cultural factors. The "large western urban areas" clusters, whose peculiar characteristics allow continuous innovation in the style field, and the "developing countries" clusters, whose investments in the past years, by large players, have favored the birth and development of industrial agglomerations that are now able, after absorbing a high degree of knowledge and know-how, to become research and development centers in the industrial field. It is very likely that this trend, which has been going on for at least a decade now, with the improvement of means of communication and transport systems, will only strengthen, making the two-cluster model the norm in the fashion industry.

Research limitations. While this research offers valuable insights, it is essential to recognize its limitations to contextualize the findings effectively. Firstly, the selection process for papers may have introduced a degree of bias, as it relied on specific keywords and exclusion criteria. This approach might have overlooked relevant studies that did not align precisely with the search parameters. Additionally, the focus on English-language publications may have restricted the diversity of perspectives represented in the analysis, potentially excluding valuable insights from non-English sources.

Moreover, the scope of the selected papers may not fully capture the breadth of research on the geography of innovation in the fashion industry, leaving out potentially relevant studies or perspectives. In particular, the use of the Scopus database alone, may have hidden important work within the topic under analysis. Looking at future developments, it would be appropriate to include additional databases in the search spectrum - first and foremost Web of Science and Google Scholar, which were excluded in this preliminary investigation for two reasons respectively: the probable overlap of papers and the inclusion of non-scientific research in its archives. Therefore, it is crucial to interpret the findings within the context of these limitations and recognize the need for further exploration and validation through diverse sources.

Managerial implications. The implications of this research extend beyond academia to offer actionable insights for industry practitioners and policymakers. Understanding the geographic dynamics of innovation in the fashion industry can guide strategic decision-making for firms operating in this sector. By leveraging insights from the analysis, managers can make informed choices regarding production location, supply chain management, and market positioning to enhance competitiveness and innovation capabilities. Moreover, recognizing the significance of local networks and ecosystems can enable firms to tap into valuable resources and opportunities for collaboration, fostering a culture of innovation within the organization. Policymakers also have a role to play in creating an enabling environment for innovation clusters to thrive, through targeted interventions and support mechanisms that facilitate knowledge exchange, skill development, and entrepreneurship. By aligning policies with the findings of this research, stakeholders can collectively contribute to the sustainable growth and development of the fashion industry.

Originality of the paper. This paper represents a significant contribution to the literature on the geography of innovation, particularly within the context of the fashion industry. By synthesizing insights from multiple studies, it offers a comprehensive analysis of the geographic factors influencing innovation processes in this sector. The extension of this analysis to include diverse perspectives and methodologies enhances the robustness and reliability of the findings. Furthermore, by highlighting the importance of non-traditional industries like fashion in discussions of economic geography and innovation, this research broadens the scope of inquiry and opens new avenues for exploration. Overall, the originality of this paper lies in its ability to integrate disparate sources of information to provide a holistic understanding of the role of geography in shaping innovation within the fashion industry, thereby contributing to a more nuanced and comprehensive discourse on this topic.

Strategic analysis of IRCCSs' sustainability management

CHIARA BELLINI¹ PAOLA OLIMPIA ACHARD² LEONARDO IOANNUCCI³

Abstract

Although Healthcare Organizations (HOs) are functional in improving and protecting health, they generate, a negative impact (mainly in terms of environmental pollution) on health itself, highlighting the need for the adoption of sustainability-oriented governance.

The paper analyzes the sustainable management modes of Scientific Research, Hospitalization and Healthcare Institutes (IRCCSs), whose businesses (care and research), include sustainability as an intrinsic dimension of their activities. The paper aims to study the sustainable strategic approach adopted by IRCCSs in the context of which it is relevant to explore also, but not exclusively, the role assumed by stakeholder management and sustainable investments.

The methodology used consists of a search for relevant documents and a joint analysis of secondary data conducted on the various strategic planning documents published by IRCCSs, and primary data from distributed questionnaires. Limitations mainly relate to statistical representativeness of the chosen sample, difficulty in accessing the documents and temporal mismatch in their publication.

The main result is the demonstration that IRCCSs, in addition to being promoters of innovation in the medical and managerial fields compared to other HOs, generate, through sustainability-based governance, positive impacts in economic, social, environmental, and ethical terms. To date, the priority areas in which IRCCSs' sustainability choices are manifested are: care services (e.g., waste management), supply chain management (e.g., supplier selection), digital innovation (e.g., telemedicine), and healthcare building (e.g., green hospitals).

The paper provides insights into the potential of adopting more sustainability-oriented governance in HOs, highlighting the crucial role of IRCCSs as promoters of sustainable strategic approaches.

Keywords: Healthcare Organizations, IRCCSs, strategic sustainability management, sustainable governance, strategic CSR

Framing of the research. The European healthcare sector, in 2021 (latest available data), led to an expenditure of 1,563 billion euros representing about 11% of GDP (Eurostat, 2024). The activities carried out by European Healthcare Organizations (HOs) result in such economic, social and environmental impacts that sustainability has become a critical issue. Health services are, in fact, intrinsically linked to social sustainability, since if the latter relates to the well-being of the community, healthcare is its driving sector. It is enough to consider that European HOs generate a significant climate impact: collectively they emit about 249 million MtCO₂ (Health Care without Harm, 2019; Karliner, 2019), equivalent to 10% of Europe's GDP (\$16.64 trillion in 2022), resulting in more than one million people dying each year due to environmental risk factors (WHO, 2023). The most recent political-institutional pressures, at the European (e.g., Next Generation EU, 2021-2027; 7th Ministerial Conference on Environment and Health, 2023; European Green Deal, 2019; Paris Agreement, 2015) and Italian (e.g., National Recovery and Resilience Plan, 2021-2027; Law decree 80/2021) levels, are also moving in this direction. The policy acts mentioned reflect a new logic regarding the roles and responsibilities of firms (Lee, 2008).

The analysis of IRCCSs' strategic sustainable management, subject of this paper, shows their value creation process. The dimensions of sustainability represent factors on which to act in managing the businesses (Engert, Rauter and Baumgartner, 2016) of IRCCSs to achieve competitive advantage.

IRCCSs (53) represent 3.5% of the total active HOs in the Italian NHS. Italy's National Health System (NHS) has a multilevel institutional set-up consisting of 21 Regional Health Systems (RHSs) in which a plurality of HOs operate (Ministry of Health, 2024).

IRCCSs were chosen for two reasons: they are knowledge-intensive firms and promoters of the evolution of the Italian NHS in the international context. In fact, by operating in the core business of healthcare R&D they have developed innovative clinical and managerial capabilities, configuring themselves also as pioneers at the regional, national and

European levels in the field of sustainable management of their activities. Sustainability management in IRCCSs is placed in the broader framework of strategic Corporate Social Responsibility (CSR), in which innovation plays a vital role (Verdecho et al., 2021). Although there are many approaches in the literature to support firms in managing sustainability, the strategic CSR framework fosters a better understanding of the phenomenon under study in relation to the strategic specificities of IRCCSs.

CSR has been defined as the fulfillment of a firm's responsibility to the needs of current stakeholders without compromising its ability to meet the needs of future stakeholders (Dyllick and Hockerts, 2002; Smith, 2001). Having evolved since 2000 into strategic CSR, it is an opportunity for firms to reconfigure the competitive landscape and to develop distinctive and dynamic resources and capabilities (Husted and Allen, 2007). The concept of strategic CSR can be traced predominantly to the integration of social responsibility into corporate strategic plans (Lantos, 2001), ways of pursuing strategic goals (Van Marrewijk, 2003) and achieving competitive advantage (Porter and Kramer, 2006). Attributing strategic relevance to CSR for firms means moving to corporate governance that: i) rethinks the concept of stakeholders (Freeman, 2023); ii) adopts differentiated stakeholder management strategies according to the degree of involvement in decision-making processes (Colvin, Witt and Lacey, 2020; Seman et al, 2018); iii) emphasize the role of collaborative strategies (Peloza and Falkenberg, 2009) based on the enhancement of interdependencies among actors/firms belonging to the public, private and social sectors (Trapp, 2012). It is worth noting that from the strategic point of view what is relevant is the ability of the firms to read the recalled aspects as interdependent (Carroll, 2015). Indeed, firms can compete by adopting a strategic approach that leads to the creation of shared value, in terms of benefits to society, while improving the firm's competitiveness (Porter and Kramer, 2018). CSR has become a strategic need for the enterprise in which the interdependencies between firm and society are maximized.

The integration of CSR is a challenging and progressive process over time, involving the incorporation of sustainability factors into the businesses in which one operates (Nguyen and Kanbach, 2024; Baumgartner, 2014). Sustainable strategic action by firms comes through the ability to reconceive services and redefine value chain activities. More recent studies highlight how strategic CSR today is geared toward the creation of sustainable shared value (Latapí Agudelo, Jóhannsdóttir and Davídsdóttir, 2019; Chandler, 2022). The management of relationships, exchanges, and interactions between the firm and stakeholders influence the scope of value creation in its various economic, social, environmental, and ethical forms (Evans et al., 2017). Sustainability has turned into one of the dimensions of corporate governance, meaning that it is a strategic choice of firms to elevate it as a driver of their decision-making processes.

This paper, as shown in the following section, explores the strategic actions of IRCCSs in terms of their ability to achieve competitive advantage by generating positive impacts in economic, social, environmental and ethical sustainability (through the integration of CSR into their corporate governance).

Purpose of the paper. The paper aims to highlight how IRCCSs, given their strategic nature, are promoters of governance based on sustainability. To this end, the research questions addressed by the present paper are:

RQ1: Do IRCCSs integrate their strategic objectives with those that are (economically, socially, environmentally and ethically) sustainable?

RQ2: Do IRCCSs pursue sustainability strategies?

RQ3: Among the possible sustainable strategies, which ones do IRCCSs adopt and to what extent do these strategies influence investments and external collaborations?

Based on the above questions, the paper presents the first results of an exploratory study to test the following hypotheses:

H1: There is a positive correlation between social, environmental and ethical sustainability in the studied IRCCSs.

Within firms operating in sectors other than Healthcare, this correlation has been confirmed in multiple studies, (Dolcini et al., 2023; Minoglou, Gerassimidou and Komilis, 2017) also if not to every extent (e.g., sometimes a medium level of social sustainability is correlated to a medium level of environmental one, while a high level in one doesn't imply a high level in the other one) (Sulewski, Kłoczek-Gajewska and Sroka, 2018).

H2: If the first two research questions have a positive answer the amount of sustainable investments is higher than in HOs that are not sustainability-driven.

As well somehow suggested also in previous studies (AlJaberi, Hussain, and Drake, 2017; Calabrese et al., 2023), the paper intends to show that if IRCCSs truly integrate sustainability goals into their strategies, they also have more investments on socially and environmentally sustainable actions (Stobierski, 2022).

H3: Sustainability-driven IRCCSs (regarding internal activities and operations) also integrate sustainability criteria when selecting external collaborations (with suppliers, other stakeholders, partners).

Research in other sectors show the correlation between internal sustainable choices and attention to sustainability in the adoption of collaboration and procurement strategies (MacDonald, Clarke, and Huang, 2022; Valbuena-Hernandez and Ortiz-de-Mandojana, 2022).

Methodology. The setting of the study is the totality of Italian IRCCSs (53), which seem more suitable than other types of HOs for several reasons:

- Compared to other HOs, IRCCSs are characterized by the presence of a greater number of strategic interdependencies between the corporate areas of research and clinical practice.
- IRCCSs play a key role in positioning the Italian NHS in the international scenario.
- IRCCSs foster a management approach based on the transfer of knowledge into daily medical activities.

- IRCCSs operate in cooperation and collaboration with other HOs and other firms to pursue their specific strategic goals.

All these aspects give to IRCCSs a specific strategic role in the evolution of the Italian NHS (Achard and Bellini, 2022) and in its direction toward governance based on sustainability (Maghsoudi, Cascon-Pereira and Beatriz Hernández Lara, 2020).

The study is qualitative-quantitative and integrates the desk research of corporate documents accessible through the IRCCSs' websites (secondary data), with primary data coming from the responses to a questionnaire administered to key strategic positions (e.g., medical director, administrative director, scientific director, members of the board of directors, divisional managers, heads of corporate functions such as purchasing, procurement, information systems) of the IRCCSs under analysis. The definite choice of questionnaire recipients is being determined through the strategic and organizational focus analysis of an IRCCS, taken as a sample reference, at a stage prior to the administration of the final questionnaire.

The documents considered in the desk research are: Strategic Plan, Mission statement, Sustainability Report, Social Report, Waste Plan, Performance Plan, Gender Equity Plan and Integrated Plan of Activities and Organization. The public availability of these documents has been detected according to the following search method: i) research on the "transparent administration" section of the corporate website; ii) If not found in the "transparent administration" section, research using the search bar of the website; iii) if not detected through the site's "search" function, they are considered as absent (which means they are not detectable, but does not mean they are absent in an absolute sense).

The questionnaire, calibrated following the response of the first IRCCS taken as the sample reference, should consist of 5 open-ended questions, which are essential to create a base of qualitative data useful for appreciating the level of attention to sustainability dynamics (including with respect to investments and collaborations), where these are not clear enough from publicly accessible strategic documents.

In addition, in order to collect quantitative data that can be used to create a correlation analysis between the factors analyzed, the questionnaire is supplemented with 10 multiple-choice questions, where multiple choice refers to two different typologies of items with respective two different types of variables:

- dichotomous variables, so items in which the possible answers are yes or no (e.g.: Has the IRCCS defined environmental sustainability criteria for the selection of its suppliers?).
- continuous variables, so items whose possible answers are ordered on a Likert scale from 1 to 5 or whose answer is a quantitatively appreciable data (e.g.: Compared to 5 years ago, how many more partners has the institution integrated into its sustainable strategy? In other words, how many collaborations have been formed with the goal of increasing social or environmental sustainability that were not in place 5 years ago)?

Some of the items are developed from the main criteria and attributes of social and environmental sustainability, to assign specific measures to both dimensions (Erjaee et al., 2022; Mehra and Sharma, 2021) and some others focus on the investigation of sustainable investments and collaborations, where not fully retrievable from published documents.

The first phase of questionnaire distribution will last for about one month; at the end of this phase, if the number of responses obtained turns out to be poorly representative, a second call for responses will be made targeting those IRCCSs that did not answer and that are of greater strategic interest to the study (because of the particular, or conversely poor, inclination to sustainability-oriented investments and collaborations). Next to this second phase, thus after about two months from the start of questionnaire distribution, we expect to have a sufficient sample to be able to test the hypotheses posed in a sufficiently representative manner. Therefore, from the joint analysis of the secondary data and those obtained from the questionnaire, it is verified whether the IRCCSs studied are sustainability-driven, whether there is a positive correlation between the three types of sustainability (H1), and whether the sustainable strategies are correlated with stakeholders and investments selection (H2 and H3). Regarding the amount of sustainable investments, the data will be analyzed in percentage value, as a ratio to IRCCSs' total investments, and will be normalized on the basis of the regional average investments' data (since some Italian Regions and, consequently, their respective RHSs have greater investment capacity than others).

Results. The integration between sustainable aims and corporate ones is greater in IRCCSs with sustainable drivers than in other types of HOs and this aspect is attributable to the distinctive competencies of IRCCSs, such as, for example, the ability to manage innovation and strategic collaborations (other than to legal requirements). Furthermore, it is expected that in the IRCCSs, the amount of investment in sustainable actions is greater than in non-sustainability-driven HOs, and that sustainability is interrelated with the selection of sustainable stakeholders and partners. Specifically, IRCCSs that establish criteria (with subsequent monitoring) for sustainability not only on service delivery processes, but also on collaboration and investment activities, are expected to have a greater outcome, in terms of sustainable strategic management. In addition, where an IRCCS is found to perform better in terms of economic, social, environmental, and ethical sustainability, it is also supposed to establish more formally defined criteria for its choice of stakeholders and investments.

Considering that the study is still in progress, it has been decided to present only the results of the desk research, which gives initial indications of IRCCSs to which the questionnaire (for the primary data collection) can be addressed. In other words, the presented data give more meaningful results in terms of usefulness, sustainability drivers and gaps on sustainability strategic documents.

Tab. 1 shows the IRCCSs, grouped by geographical areas, having strategic programming acts from which information on social, environmental and/or ethical strategies can be detected and indicates the quantitative values of the IRCCSs

that possess them (in absolute terms and as a percentage of both RHS and NHS). Year(s) of publication stands for the year in which the last available document among Sustainability Report, Social Plan and Mission Statement has been published by each IRCCS.

Tab. 1: Sustainable strategies in Italian IRCCSs, grouped by geographical areas

Geographic area (RHS)	n° of active IRCCSs in the RHS	n° of IRCCSs whose sustainable planning acts are accessible	% of IRCCSs with detectable sustainable strategies in the RHS	% of IRCCSs with detectable sustainable strategies in the NHS	Year(s) of publication

Fig. 1 shows the IRCCSs adopting the Gender Equity Plan (orange bars), comparing them with the total number of IRCCSs in their respective regional territories (blue bars).

Only RHSs with at least one IRCCS adopting one of the sustainable strategic documents among Mission Statement, Sustainability Report and Social Report (Tab. 1) or GEP (Fig. 1) were considered. The factors of economic sustainability, which acquire significant value for some specific IRCCSs, should not be overlooked, but in the case of the data presented, we mainly focus on sustainability in the social, environmental, and ethical spheres.

Fig. 1: GEP adoption in Italian IRCCSs, grouped by geographical areas (RHS)

Source: authors' own elaboration

As part of the desk research, strategic planning documents were collected, with a special focus on those that delve into the strategic orientation of IRCCSs with regard to social, ethical and environmental sustainability. Hence, what the documents analyzed deal with as a priority are the activities aimed at containing consumption, reducing pollution and eliminating inequalities with a view to occupational well-being.

It is essential to premise, moreover, that few of the IRCCSs analyzed make reference (in the documents reviewed) to the management methods, types and analysis of stakeholders, which, precisely because of this gap, will be explored in depth through the questionnaire that will be distributed.

Nevertheless, from the available documents, it's noticeable that the priority areas within which IRCCSs' environmental sustainable choices are manifested are the following ones:

- Nursing care services (e.g., reducing CO₂ emissions; managing medical waste; increasing appropriateness of services). For example, IRCCS Meyer has signed a sustainability protocol with Alia Multiutility Toscana to make differentiated waste management within the IRCCS more effective.
- Supply chain management (e.g., supplier relationships management). IRCCS Ospedale Pediatrico Bambino Gesù has promoted sustainable supply chain management by adopting procedures and policies for selecting suppliers, contractors and business partners that are fair and transparent and include the integration of ESG (Environmental, Social and Governance) criteria.
- Digital innovation of health services. IRCCS Fondazione Policlinico Agostino Gemelli started the KIT (Keep In Touch) 2.0 project for the care and monitoring of patients undergoing cancer treatment. The KIT mobile app allows the patients from to communicate from their home with the doctor and monitor their clinical situation also through smartwatches that allow for continuous information on different aspects of health.
- Healthcare building structures (e.g., green hospitals) (Prenestini, Ristuccia and Florianello, 2023). IRCCS Ospedale Galeazzi Sant'Ambrogio is among the most sustainable hospitals (at structural level) in Europe and is located in the Milan Innovation District. The IRCCS is designed to be fully developed in height and wherever flat roofs are not accessible they are resolved to intensive green roofs.

Moreover, the results of the desk research show that the strategic behaviors of IRCCSs in terms of their ability to create value and maintain competitive advantage go through strategies that are also effective in developing collective benefits. Conversely, it is also true that strategies aimed at social sustainability, as already specified, are inherent in IRCCSs' activities and, therefore, necessarily contribute to creating value and competitive advantage in the Healthcare system.

Finally, there are secondary factors that can be highlighted by a reading of Tab. 1 and Fig. 1, which could complement the discussion with expanded reference to the RHSs under consideration, although the specific focus of the current study remains at firms (and therefore IRCCSs) level.

For instance, among the RHSs there is one in which more than 1/3 of the total Italian IRCCSs are concentrated, Lombardia, which, however, when considering the percentage of IRCCSs that adopt sustainability strategy documents, ranks last among all RHSs (22.2%). This is not to say, however, that IRCCSs in Lombardia do not follow any sustainable principles or adopt strategies that are not sustainability-oriented. In fact, as has been said, it is not possible for HOs in general to achieve strategic goals without implicitly considering sustainability factors. The point that is most useful to capture, perhaps, is the paucity of transparency regarding how these goals are achieved from a sustainable perspective. Related to this, one could understand the reported data from a different perspective: rather than seeing it as a prospectus on IRCCSs sustainability, it can be seen as a point in the issue of transparency on data considered crucial for corporate sustainability analysis. This opens a further consideration: while it is true that IRCCSs that do not publish data (or whose strategic documents were not found to be accessible) are not necessarily disregarding sustainability in their strategic choices, value must be placed on the absence or inaccessibility of such documents. Transparent reporting in the healthcare system has value in monitoring HOs and improving public opinion regarding the quality of the healthcare system (Hafner et al., 2011) and, therefore, is always of great importance to be encouraged even at the central level of Health Policy (Akmal, Gauld and Penno, 2022). It is emphasized, however, that the topic of sustainability has been introduced, formally and legally, in the healthcare system recently, so moving ahead of the advancement and absorption of this topic in strategic management, even of advanced HOs such as IRCCSs, is certainly a factor to consider when noting the absence of adopted strategic documents. IRCCSs, dealing with healthcare R&D, also compete and collaborate with European firms in the project and investment domains, this implies that the adoption of sustainable practices is implicitly necessary since, often, it is one of the necessary requirements. It follows from what has just been recalled that it is normal for IRCCSs to be more sustainable than other firms that only operate within the Italian NHS, as is expected to be confirmed by the full results of the study.

Research limitations. In the healthcare system, the issue of sustainability is widely spread (Gubelli et al., 2020), but not yet implemented in the strategies of most firms, so it is difficult to have a clear picture of what they do and how they operate from a sustainable perspective. Apart from some documents (e.g., the PIAO, the integrated plan of activities and organization), within which environmental sustainability part has been integrated, there are no real minimum standards to which IRCCSs must adhere in developing their strategies of sustainable nature. In addition to non-standardization limitations (just mentioned), another issue, methodological in nature, is the lack of external validity, due to two factors:

- Limit of statistical representativeness. The study will not be numerically representative because exhaustive information or people willing to fill out the questionnaire cannot be found in all IRCCSs, so the sample identified will still be limited to a minimal part of the totality.
- There is a time mismatch in the publication of the documents analyzed because of the temporal differences in the election of the regional representatives.
- The possibility of access to documents in digital format is attributable, in part, to the degree of digitization of the enterprise.

Managerial implications. The paper provides an incentive for HOs managers to consider potential uptake of projects, activation of corporate functions and creation of task forces dedicated to social, environmental and ethical sustainability. The organizational structure that serves as a vector for sustainable practices can also be supported through the

development of an internal communication system. Evidence, moreover, contributes to the stimulation of corporate potential, as the analysis of the most advanced and pioneering healthcare firms can incentivize others by generating a benchmark effect. Thus, the concept of sustainability understood as a need for regulatory legitimacy and institutional isomorphism on the part of HOs could be overcome, aiding in the development of internal management modalities that favor the dissemination of good (sustainable) practices adopted by the most cutting-edge firms of the Italian NHS. Moreover, the paper may help decision makers to prioritize sustainability practices with the goal of helping to recognize the most significant strategies for pursuing sustainable goals. Waste reduction and management, energy choices, healthcare facility upgrades, use of technology, and investment in staff training can guide managers in building competencies for sustainable governance.

Originality of the paper. The present paper contributes to define the current scenario in the adoption of sustainable strategies by IRCCSs and to expand knowledge in the area of sustainable strategic management within HOs, including by understanding the interconnections between corporate governance, sustainable investments, and external collaborations. HOs are widely studied firms, including regarding the impacts that sustainability has at a corporate level both in Italian and European contexts. Despite this, it is difficult to find a state-of-the-art on the topic that explores strategic actions of very representative firms from a management perspective. Instead IRCCSs, benefiting from highly correlated business diversification and differentiation strategies, and competing, as already mentioned, also at the European level, could be considered highly representative. Finally, the paper does not rely on the punctual analysis of instruments, but researches and proposes a broader overview that completes the picture of strategic CSR within HOs.

The role of HR analytics to enable Strategic HR management in SMEs

CHRISTIAN DI PRIMA¹ ALBERTO FERRARIS²

Abstract

Despite human resource (HR) management activities are increasingly recognized as crucial also for small and medium enterprises (SMEs), in the last decade the academic literature has mostly overlooked the difficulties experienced by these companies when dealing with the matter. Consequently, the objective of this study is to explore these difficulties and to understand how a data-driven approach enabled by HR analytics can help in overcoming them and establish a strategic approach to HR management in SMEs. In order to do so, a qualitative, multiple case study methodology will be applied. This approach will allow us to revitalize the academic discourse by incorporating the contemporary challenges and complexities encountered by SMEs when dealing with HR management, filling the void left by the stagnation of literature in the past decade. Furthermore, we will expand the HR analytics related literature by exploring its role also in SMEs.

Key words: HR management; HR analytics; HR management activities; small companies; medium companies; SMEs, qualitative approach, multiple case study

Framing of the research. Italy is home to a substantial number of small and medium enterprises (SMEs) that form the backbone of its economy (Istituto Nazionale di Statistica 2023). These enterprises, often family-owned or characterized by close-knit communities (Matarazzo et al. 2021), typically exhibit peculiarities that distinguish them from their larger counterparts, such as limited resources, a familial organizational culture, and a close interdependence between business and personal relationships (Nigri and Di Stefano 2021)

The profound shocks experienced globally in the past few years, including economic downturns and public health crises, have been even more pronounced in SMEs, amplifying the challenges faced by these enterprises (Miklian and Hoelscher 2022), due to the intricacies of their operations coupled with a higher degree of interdependence between business and personal relationships (Rubio-Andrés et al. 2022). This heightened turbulence has accentuated the critical role of human resource (HR) management in SMEs. With the increasing complexities and uncertainties in the business landscape, SMEs have been compelled to reassess their HR management strategies to effectively navigate through these challenges (Ottolenghi 2023). As a result, there has been a notable escalation in the emphasis placed on HR management practices within SMEs, highlighting the imperative for robust HR management frameworks tailored to the unique needs and constraints of these enterprises. Unlike larger organizations with dedicated HR departments, SMEs often grapple with limited HR expertise and financial constraints (Psychogios et al. 2016). Furthermore, these enterprises are notably lagging in the digitalization of HR management processes compared to their larger counterparts (Verma et al. 2021; Nicolás-Agustín et al. 2024). In SMEs, the responsibilities of HR management frequently fall on the shoulders of the owner / manager, a role that demands multifaceted competencies ranging from strategic HR planning to daily operational tasks. This dual role places a strain on the managerial capacity, potentially hindering the development of effective HR management strategies (Atkinson et al. 2022).

To address this issue, there is a growing recognition that HR analytics, defined as «a proactive and systematic process for ethically gathering, analyzing, communicating and using evidence-based HR research and analytical insights to help organizations achieve their strategic objectives» (Falletta and Combs, 2021, p. 54), can serve as a valuable tool for SMEs, providing insights and data-driven decision-making support in the absence of a dedicated (and strategic) HR function (Biea et al. 2023). Indeed, although until a few years ago, this tool was the prerogative of only a few companies - particularly, multinational corporations in the technology or financial sectors (Andersen 2017) - in recent years, its diffusion has significantly increased even in smaller-sized enterprises. This has been made possible by the evolution of technology, which, on one hand, has allowed for the automation of a considerable part of the process, making analytics more accessible even to individuals with limited expertise in data analysis (Arora et al. 2021). On the other hand, technology advancement has substantially reduced the costs associated with these solutions, a crucial aspect for SMEs often operating with limited resources. Providers of HR analytics technologies have also played their part by designing

e-mail: christian.diprima@unito.it

² University of Torino
e-mail: alberto.ferraris@unito.it

tailored solutions specifically addressing the needs of SMEs (e.g. Keka and People Matters 2023). The utilization of HR analytics in SMEs is particularly pertinent, given the limited expertise and time constraints typically faced by owners / managers (Atkinson et al. 2022). This tool can offer crucial advantages in enhancing decision-making processes related to HR management, compensating for the absence of specialized HR professionals.

Despite the burgeoning body of research in HR management, there exists a significant gap when it comes to investigating the intricacies of HR management within the context of SMEs. The current literature, though expanding, remains fragmented and variable, marked by a diversity of definitions, explanations, and methodological approaches (Harney and Alkhalaf 2021). This gap is further exacerbated when considering the myriad challenges and difficulties that SMEs encounter in the realm of HR management. While scholarly attention towards HR management in SMEs was relatively extensive during the 1990s and the initial years of the 21st century (e.g. Tocher and Rutherford 2009), there is a conspicuous absence of more recent studies that reflect the substantial changes these businesses have undergone in the last decade. The evolving landscape, characterized by global shocks and technological advancements, necessitates a contemporary understanding of HR management in SMEs. Adding to this lacuna, existing research on the topic has predominantly adopted the perspective of the owner/manager, overlooking the invaluable viewpoint of employees (Harney and Alkhalaf 2021). This is a noteworthy concern, especially given the assertion that employees in SMEs have been observed to be more 'discriminating' and 'diagnostic' compared to the owner / manager (Verreynne et al. 2013). Focusing solely on the owner / manager perspective limits the comprehensiveness of our understanding, potentially overlooking crucial nuances in the HR management dynamics within SMEs. Furthermore, despite these companies are increasingly relying on HR analytics to deal with their HR management practices, previous studies on the topic typically focused on large companies, as these typically present the most advanced HR analytics tools (Cayrat and Boxall 2022; Thakur et al. 2024).

Purpose of the paper. *In light of the research gaps that have been identified, the main objective of this paper is to provide a more comprehensive understanding of the multifaceted challenges and difficulties faced by SMEs when dealing with HR management. This will be done by adopting a holistic approach that considers a dual perspective, the first from the owner / manager and the second from the employees. Furthermore, our research endeavors to assess the role of HR analytics in assisting SMEs in navigating these challenges. Our study will thus try to answer the following research questions:*

RQ1: What are the main challenges and difficulties experienced by small and medium enterprises when dealing with human resource management?

RQ2: How can a data driven approach fostered by HR analytics help in overcoming these issues and foster a strategic approach to human resource management in small and medium enterprises?

Methodology. *To address the research questions formulated in this study, we will employ a qualitative method, adopting an exploratory multiple case study approach (Yin 2014; Sardi et al. 2020). Respondents will be selected through purposeful sampling in order to assure that they possess specific criteria relevant to the purpose of our study. To facilitate the recruitment process, we will collaborate with one of the largest Italian HR analytics technology providers, leveraging their network and resources to reach potential participants efficiently. Specifically, we will select small and medium Italian enterprises which have been implementing HR analytics in the last three years. In addition to respect the conditions to be defined as a small or medium enterprise (Loecher 2000), selected companies should be privately owned (thus excluding, for example, spin off companies from larger organizations, even if they should respect the abovementioned conditions). Companies will be included from a variety of sectors, growth stages (startups, established businesses, companies scaling up, etc.) and HR management maturity level (from a totally informal to more advanced infrastructures) to ensure that participants will provide diverse and relevant perspectives. Ideally, to assure a representative sample of participants, we would like to include at least 20 companies.*

Semi-structured interviews will be conducted with key organizational stakeholders, encompassing both the owners / managers and the employees. The Gioia method (Gioia et al. 2013) will guide the analysis of these interviews. To facilitate a comprehensive coding approach, all interviews will be transcribed in their entirety (Miles et al. 2014). The analytical process will involve a multi-step iterative approach, incorporating critical verification techniques such as cross-checking by different coders to enhance validity (Morse et al. 2002).

Results. *As the study is currently ongoing, the following discussion outlines the possible results that may be obtained by reflecting on those of previous research. Previous studies, such as Tocher and Rutherford (2009), have highlighted that SMEs commonly encounter challenges in attracting, developing, and retaining high-quality employees. This aligns with a broader understanding that SMEs face distinctive hurdles in their HR management practices.*

Typically, SMEs grapple with a range of difficulties in HR management, including resource constraints, limited expertise, and the inherent complexity of managing both business and personal relationships within the organization (Nigri and Di Stefano 2021). These challenges often manifest in the struggle to establish effective recruitment and retention strategies, provide comprehensive employee training and development, and implement robust performance management systems (Mendy 2021; Jones et al. 2024).

While these issues have been extensively examined in the existing literature, recent years may have witnessed the emergence of new challenges. Although scholarly attention towards HR management challenges and difficulties in SMEs appears to have slowed down, contemporary developments such as the emphasis on diversity and inclusion (Ravazzani et al. 2021), the growing importance of employee wellbeing (Pagán-Castaño et al. 2020), and the integration of innovative technologies like artificial intelligence could introduce novel complexities (Biea et al. 2023). The dynamic nature of the

business landscape suggests that these trends may significantly impact HR management practices in SMEs, necessitating a reevaluation of traditional challenges and the exploration of contemporary issues.

Against the backdrop of these challenges, the strategic adoption of HR analytics emerges as a potential catalyst for overcoming these hurdles. HR analytics offers a data-driven approach that can empower organizations to make informed decisions, optimize processes, and address longstanding challenges in a more efficient manner (Falletta and Combs 2021). Regarding talent acquisition and retention, HR analytics can provide valuable insights into recruitment trends, employee preferences, and turnover patterns (Di Prima et al. 2023). By leveraging predictive analytics, organizations can identify potential recruitment challenges, understand factors contributing to employee attrition, and tailor strategies to attract and retain the right talent (Yahia et al. 2021). HR analytics can also optimize training and development initiatives by identifying skill gaps, assessing the effectiveness of training programs, and providing real-time feedback. This data-driven approach allows organizations to prioritize training investments and ensure they align with business objectives (Di Prima and Ferraris 2023). For what concerns performance management, HR analytics may enable a more objective evaluation of employee performance, facilitating fair assessments and data-driven feedback (McCartney and Fu 2022). This can contribute to the development of personalized development plans and, ultimately, enhance overall organizational performance (Di Prima and Ferraris 2022). Finally, in the face of emerging challenges such as diversity and inclusion, employee wellbeing, and technological innovations, HR analytics can help organizations adopting a proactive approach. By analyzing data related to workforce diversity, employee satisfaction, and the impact of technological advancements, SMEs can tailor their HR strategies to meet evolving needs. For instance, predictive analytics can help forecast potential wellbeing issues, allowing organizations to implement proactive measures to support their employees (Gurusinghe et al. 2021).

Research limitations. *Despite its important contribution, this study is not exempt from limitations. First, as data will be exclusively collected in Italy, the findings may have limited generalizability to different cultural, economic, or institutional contexts. SMEs in other regions or countries may exhibit distinct characteristics that influence HR management practices and outcomes differently. Second, despite all necessary precautions will be taken, the accuracy and reliability of the data hinge on participants' willingness to provide honest and comprehensive responses. Response bias, where participants may provide socially desirable responses or withhold certain information, could impact the validity of the results. Third, qualitative analysis, such as the interpretation of semi-structured interviews, introduces an inherent subjectivity. The researcher's interpretation and coding process may influence the outcomes, potentially leading to biased conclusions.*

Managerial implications. *This study bears significant practical implications for practitioners and SMEs owners aspiring to refine their HR management practices. Initially, the meticulous identification and exploration of the primary challenges and difficulties confronting SMEs furnish practitioners with actionable insights. A comprehensive understanding of these challenges empowers practitioners to formulate targeted strategies, effectively surmounting obstacles and fostering a more efficient organizational environment. Secondly, the explication of HR analytics' role may serve as a catalyst for increasing the adoption of this sophisticated tool within SMEs. In fact, its usage may improve decision-making processes and organizational outcomes, with a positive impact for both the enterprise and the overall society, since SMEs constitutes the backbone of Italian economy.*

Originality of the paper. *This study will contribute significantly to the existing literature by shedding light on the role of HR management within the distinctive context of SMEs. First, by delving into the main difficulties faced by these enterprises, the study will reopen a crucial debate that witnessed its peak in the 90s and the first decade of the 21st century, yet experienced a notable decline in scholarly attention thereafter. The research will not only clarify the contemporary challenges but also introduces new findings, considering the emergence of novel complexities such as technological advancements, diversity and inclusion imperatives, and other evolving trends. Second, unlike a predominant focus on the viewpoint of owner / managers in most previous studies, this research takes a novel approach by incorporating the perspectives of employees. Recognizing the significance of both organizational leaders and staff in shaping HR management outcomes, this inclusive approach provides a more comprehensive understanding of the dynamics at play within SMEs. Third, this study stands out in the realm of HR analytics literature by shifting the focus from large enterprises to SMEs. While much of the existing research concentrates on the adoption and impact of HR analytics in larger organizations, this paper addresses a critical gap by exploring the utilization of HR analytics technology in the context of SMEs. By doing so, it offers unique insights into how these businesses leverage technology to enhance their HR management practices, bridging a significant knowledge void in the current academic landscape, ultimately expanding and enriching the existing literature on the topic.*

Trick or Treat: Firm's strategic response to temporary shock in the real estate business

ALBERTO MASSACCI¹

Abstract

The sector crisis, exacerbated by the arrival of the pandemic and the need to guide the real estate sector, among the most energy intensive, towards ecological transition, has prompted the Italian government to promote initiatives aimed at stimulating the economy and driving the process of urban redevelopment. Therefore, in 2020, the government promoted an incentive scheme aimed at supporting investments in energy and seismic issues through the involvement of several private actors. On the wave of the shock generated by the policy, real estate building companies had to decide whether to innovate in order to address the new type of demand supported by the rules introduced by the Government. However, managerial skills, time constraints and the relative competitive position of firms have provided different opportunities. The paper investigates the idiosyncratic traits of the real estate building companies that have led to these differences in the exploitation of the resources made available by the Government. In addition, we introduce a risk indicator associated to the negative effect produced by the policy. Results show that while some geographical similarities are present, managerial skills may have contributed to find the right balance between opportunity exploitation and risk management.

Key words: Managerial skills; Dynamic Capabilities; Energy transition; Policy; Real-Estate;

Framing of the research. *Climate change mitigation policies are increasingly under the scrutiny of all governments in the world. While providing an opportunity for countries to take advantage of the potential effect at the macro-level, those policies more often generate alteration to the internal market in which they are implemented. For this reason, Governments seek to maximize the sustainability effect of the policy by not limiting the effects to environmental aspects but also trying to promote the social and economic sustainability of the country.*

The need for firms to respond to the introduction of innovations and the evolving consumption habits of consumers that generates supply and demand shocks in the industry has been largely debated in the Economic and Managerial literature (Wang et al., 2014). In such a context, the managerial impact on strategic change and firm performance has been largely emphasized (Helfat et al., 2015). From a Dynamic Capabilities perspective, formulating a strategy to gain a competitive advantage starts with the adoption of suitable business models and technologies. This adoption facilitates the seamless combination and orchestration of assets that are inherently challenging to replicate (Teece, 2007). A stream of literature has emphasized how firm's diversity in a competitive environment may lead to the adoption of different strategies due to comparative adjustments costs (Argyres et al., 2015). Indeed, firms must consider the costs and time needed to shift from their existing position to any of the potential competitive positions that may arise as a result of the innovation shock; hence, they must decide whether, where, and how to adjust to a particular competitive position opened by the shock (Argyres et al., 2018).

The real estate sector is responsible for 43% of the whole energy consumption, with residential properties contributing to two thirds of consumption at the European level (Enerdata, 2021). The European Union, as part of the European Green Deal, has introduced the Energy Efficiency of Buildings Directive, aiming to establish minimum standards that countries must adhere to within specified timelines.

In response to these directives and to contribute to the economic recovery, in 2020, the Italian government has introduced a new incentive mechanism to support the environmental transition of the Real Estate sector. This program, called "Superbonus", has offered tax incentives for all costs spent by citizens on the requalification of their homes (mainly seismic and energy improvements). The incentive consists of a tax deduction of 110% of the expenditure. This, while providing an opportunity for citizen, has contributed to the surge in demand for services in several sectors. Among the most activated industries by the policy are, obviously, the Real Estate (with all the entire supply chain connected to the provision of the services) and the banking sector.

However, some aspects related to the policy have led companies to modify their business strategies in order to respond to new market needs. This has led companies to add innovations to their business models and the ability to manage such innovations has been the key to the success of the companies in the last 3 years; indeed, in order to guarantee the social sustainability of the policy and a fair access to opportunities, the government has introduced 2 credit management mechanisms. The first consists in the possibility of the citizens to monetize the incentive by selling the credit generated

¹ e-mail: albertomassacci@hotmail.it

through the restructuring. The second involves a discount on the invoice by the construction company in exchange for the transfer of the credit from the citizen to the company which, in turn, will be able to decide whether to use the tax credit or sell it to third parties. Such mechanisms should have prevented the inability of citizens to exploit the benefits due to low fiscal capacity or liquidity constraints (indeed, the discount on the invoice was usually equal to the total amount since the company was able to obtain a credit equal to 110% of the invoice).

Due to this, banks had the opportunity to create a market for credits since financial institutions were the only actors authorized to buy and re-sell this new type of credit (while the others only had the possibility to buy and use the fiscal credits for their needs).

On the other hand, building companies were asked from the market to offer the invoice discount as an alternative payment method. In order to satisfy the new rising demand, firms were asked to create a new system of credit management that involved financial, fiscal and managerial capabilities. Indeed, while fiscal and financial abilities should be used to determine the appropriate volume of work to manage while satisfying the financial obligations, managerial skills were crucial to manage the supply chain requirements needed to respond to the increased demand for work.

These prerequisites turned out to be even more necessary in the moment of explosion of demand given that the market offer was not able to absorb all the requests generated by the incentive.

In such a context, managerial skills have been crucial in defining objectives in line with company capabilities. Although, in the short term, the wickedness of some companies has produced unfair competition on the market, as soon as the issues related with this new type of business began to emerge, most of these companies found it difficult to continue their activities, creating discontent among the clients who had hoped to carry out the works at zero cost.

Purpose of the paper. Drawing on the literature on innovation capabilities and the conceptualization of comparative adjustment costs, the work aims to provide an overview of the relationship between firms' competences and structure, innovation strategies, and their impact on performance. The study is applied within a specific framework that, as previously mentioned, has temporarily positively shocked the market demand due to the introduction of a policy that has generated a new market segment (i.e. the completion of the renovation works with a discount on the invoice and, therefore, no financial outlay for the client). While creating new demand for building companies, the policy has shifted part of the original demand towards this new market segment.

This paper attempts to contribute to this literature by providing new empirical evidence on the impact of firm's competencies on the ability to respond to market changes. Differing from most previous contributions, this work delves into a sector with low managerial involvement. Furthermore, the peculiarity of the case under study arises from the temporary nature of the shock, which introduces an additional parameter for firms to consider in their strategic choices. From a policy perspective, the paper explores how uncontrolled resource distribution can accentuate disparities among companies, thereby amplifying the competitive gap dictated by original capabilities.

Methodology. The empirical goal of the paper is to assess the strategic actions and performance across the heterogeneity in competence and structure that characterizes the industry in response to the introduction of the Superbonus. The analysis is conducted on a database of real estate building companies that are monitored from year 2018 to 2022.

The two main research questions we aim to investigate in the paper concern the firm's characteristics that may have contributed to increase the likelihood to enter this new market, generated by the policy, and whether there exist some aspects that have facilitated the management of this transition.

In order to answer the first question, we will measure the willingness to innovate the original business by implementing the invoice discount and, as a consequence, we will look at the rate of variation in the fiscal credits between the period before the introduction of the policy (2018) and the last available year (2022). Furtherly, we will see whether some firm's characteristics have also contributed to the increase in the volume of production, measured as the rate of variation in turnover over the same period.

In the second part of the analysis, we will measure the ability of firms to navigate the policy by developing a risk metric that relates to a significant issue faced by companies due to the policy, specifically concerning the trading of fiscal credits. This challenge was evident in both the invoice discount scenario, where the responsibility of selling the credits rested with the company, and in the credit transfer situation, where the buyer paid the company and monetized the incentive through credit sales. The conversion system faced a substantial setback primarily due to a lack of buyers. Consequently, companies found themselves accumulating fiscal credits without the ability to convert them into liquidity. Simultaneously, clients struggled to meet their financial obligations because of the difficulty in promptly converting credits at various project stages.

Hence, the risk measure used in the analysis is constructed as:

$$\frac{\text{Fiscal credits}}{\text{Turnover}}$$

The firms' characteristics that we aim to investigate are their overall competence, the organizational structure and the managerial capabilities. Given the availability of information in the data, the three measures have been proxied as the "Average employee salary" for firm's overall competence (Diaz-Fernandez et al., 2009), Return on Assets for the

managerial² aspects and the “number of employees in relation to the turnover volume” for the organizational structure.

For the first part of the exercise, given that the goal is to understand the strategic decisions made on the base of the ex-ante structure of the firms, we will regress lagged companies' structures on the final variable of interest³.

In order to estimate the effect that organizational structure and competence have played in this period (i.e. The ability to navigate the policy), we have used the difference-in-difference with continuous variable treatment (Callaway et al., 2024) regression to exploit the introduction of the exogenous shock as a trigger point, while taking into account the different organizational, managerial and competence levels. Since the introduction of the measure was in mid-2020 and works took a while to start due to the lack of available materials, the effects on the balance sheets are likely to be present from year 2021; hence, the arrival time (trigger effect) was postponed by one year and constructed as (0.5 for 2021 and 1 for 2022). Finally, regional fixed effects were used to account for the territorial differences that have emerged in the implementation of this policy, both on the supply and demand side. The second year of the Superbonus in the trigger variable is greater than the first because our variable of interest are likely to sum up to the previous year; hence, a standard dummy variable would be likely to bias our estimates.

Data and Statistics. The companies analysed cover the whole Italian territory. The dataset is limited to firms that had an available balance sheet and a turnover constantly above one million euros for the entire period under analysis, in order to ensure adequate reliability of the financial statements.

The overall dataset is made of 11.059 real estate building companies which were selected according to their NACE code. The period of analysis cover 5 years-time (from year 2018 to 2022 (last available)). Since our only source of information is the AIDA database, we exploit the information obtainable from the balance sheet in order to deepen our research interests.

Table 1: Average value by year. *(value in thousands of euros)

Firms Overview	2018	2019	2020	2021	2022
Turnover*	5188	5498	5280	6726	8260
NOI*	123	162	159	108	415
Fiscal Credits*	206	210	218	450	672
Credits to Client*	2119	2154	2152	2455	2824
Employees	23	24	25	27	27

Table 1 shows how the policy has pushed firms' turnover, while simultaneously increasing the relative weight of credits in relation to firms' size and turnover.

Indeed, by looking at the yearly variation in different measure of riskiness that we considered [i.e. $\frac{\text{Fiscal Credits}}{\text{NOI}}$], it is clear how the overall riskiness related to this concept has changed with the arrival of the Superbonus; moreover, despite the fiscal credits compared to the net operating income have decreased in 2022, it is crucial to consider that while the fiscal credits will remain in companies balance sheet for the next five years, if they won't be able to find a buyer, the end of the Superbonus will probably be reflected in a huge drop in firms' turnover and income from year 2023.

The need to find potential buyer for the credits deriving from the Superbonus (included those related to clients since they were likely intended to sell them to third parties⁴) for such a large amount of credits is, nowadays, resulting in very large discount rate which will be reflected as income loss for firms and citizens.

If we look at the geographical effects of the policy, we can see that while the variation in fiscal credit was larger in the northern area, with the exception of some Sicilian provinces (Figure 1), the variation in financial turnover was much more relevant in the southern regions.

² Given that all the companies are in the same business, we assume that ROA can be a proxy of the managerial capacity of the company in generating profit.

³ The need to investigate the strategy rather than investigating the evolution has led to the exploitation of the dataset in longitudinal terms but without utilizing its panel structure.

⁴ Indeed, many citizens have been forced to anticipate the cost of refurbishment due to the difficulties in finding building firms that were able to offer the invoice discount after the initial period of euphoria. This was mainly done through private liquidity or bank mortgages; however, given the high cost required to satisfy the energy improvement minimum standards, the ability to monetize fiscal credits through tax deduction is only possible for a relatively large share of households. Moreover, no further impediments have been caused by the Superbonus, in terms of availability of liquidity to pay for renovations for owners who have no intention of selling tax credits, such as to justify such a significant increase in the ratio between customer receivables and turnover.

Figure 1: Variation in Fiscal Credit (2019 to 2022)

Figure 2: Variation in Turnover (2019 to 2022)

Investigating the riskiness associated to the negative effect of the policy, Figures 4 and 5 provide a very distinct situations where the south of Italy appears to be much more affected both in terms of accounts receivable from customers and regarding the tax credits held by companies. While the graphs and statistics provide an understanding of the overall effect of the Superbonus on real estate building companies. The goal of this paper is to analyse which characteristics have been determinant in deciding whether to adapt the business model to the needs of the policy and how firms' characteristics have affected the overall company management of this period.

Figure 3: Fiscal Credits over Net Operating Income

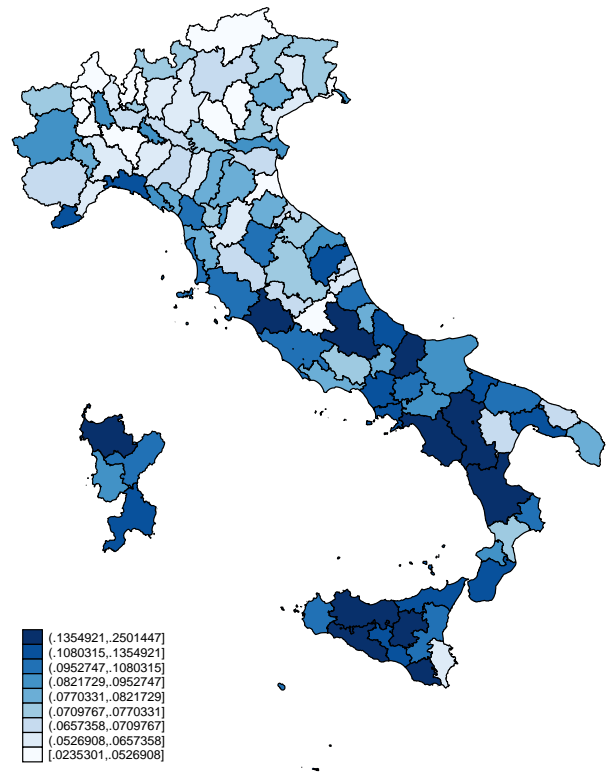

Figure 4: Fiscal credits and credits to clients over turnover

Results. As previously mentioned, the research questions that we aim to answer in this paper, in addition to presenting a descriptive overview of the effects of the Superbonus, concern the firm's characteristics that have increased the likelihood to enter this new market, generated by the policy, and whether there exist some aspects that have facilitated the management of this transition.

Table 2 and 3 in the Appendix provide the results of the effect on the strategy adopted by firms in this period in relation to their overall competence, the organizational structure and the managerial capabilities.

The results show that, although the Superbonus has generated a widespread increase both in terms of business volumes and in the implementation of the new business model, some company characteristics are significant in defining the adopted strategies; indeed, while all three firm characteristics investigated are associated to a more prudent strategy in terms of production volumes, managerial skills appear to have facilitated access to the new market type generated by the introduction of the invoice discount⁵.

With regard to the ability to navigate the policy and find the right balance between performance and risk management, the regression show that the Superbonus has increased the overall riskiness of the sector (the trigger variable is positive and statistically significant in all regressions) which could be amplified in case of a slow down in the real estate market in the following years.

Moreover, Tables 4, 5 and 6 show how all the variables of interest are acting as positive moderator in the management of the fiscal credits. However, while overall competence and managerial capabilities are statistically significant at the 10% level, the organizational structure, despite displaying a negative correlation with the risk measures used in the analysis, does not provide statistically significant results.

Research limitations. The paper is an explorative study that focus on the financial information drawn on the AIDA database that have forced to approximate proxies regarding the company's characteristics. Indeed, future explorations could be expanded through the exploitation of different data sources, such as questionnaires. Moreover, future assessments are essential to provide a comprehensive picture of the impact generated by the policy, as the measure is still ongoing.

Furthermore, since the Superbonus has often been associated with scams related to the non-existence of construction sites for which work was invoiced, and thus tax credits obtained, another aspect of investigation that will need to be taken into consideration concerns this aspect, which to date remains unexplored.

Managerial implications. The managerial implications are several as it delves into the managerial and policy implications of public incentives aimed at fostering sustainable goals. From a policy perspective, it seeks to analyze the effects on private sectors of the use of public resources in the promotion of environmental, social, and economic sustainable goals. Moreover, from a managerial perspective, the paper aims to elucidate the requisite skills for private companies in effectively managing public funds. This is a pivotal aspect within socially significant sectors such as housing, agriculture, and healthcare, as these forms of incentives are frequently employed to bolster them.

Originality of the paper. The best of my knowledge, this study represents the inaugural attempt to explore the effects of one of the most substantial government investments of recent decades on businesses. The novelty of the topic and the data utilized present a subject of significant interest both theoretically and from a managerial standpoint, offering an overview of the real estate sector that could potentially be affected by a forthcoming period of recession.

As previously mentioned, this is our first attempt to delve into this topic, which we intend to explore more deeply in the near future as we wait for the economic cycle to evolve and strive to improve the available data.

⁵ The invoice discount was already present before the superbonus but in a reduced form and spread over many more years, not representing a problem for the companies.

Logistics & Operations**

Who Should Pay for the Returns Product? The Effect of Transparency on Consumers' Decision-making across the Reverse Supply Chain

BENEDETTA BALDI¹ NADJA VORONTSOVA² IVAN RUSSO³ THOMAS J. GOLDSBY⁴

Abstract

The increasing volumes of consumer returns present a growing challenge for retailers, significantly impacting sustainability across all three dimensions of the triple bottom line: environmental, social, and economic. Concurrently, consumers are expressing increasing concerns about the environmental impact of returns. Given these concerns and the increasing involvement of consumers in logistics and supply chain management processes, it becomes imperative for retailers to consider empowering consumers as active decision-makers in the returns management process. Achieving this requires integration of consumers' decisions with a triple bottom line perspective, to align efficient returns management with an enhanced consumer experience. In this study, we investigate how transparency of returns' triple bottom line impact influences consumers' decision-making regarding returns. Drawing on the self-efficacy theory and the concept of psychological distance, we elucidate the social and psychological factors that drive consumer choices. We conduct a series of experiments to address our research questions. Our main study is informed by initial insights derived from a focus group method, followed by a series of complementary experiments, including both a scenario-based and a stated choice study. Our main contribution to the literature extends the existing knowledge on returns by examining the context of consumer decision-making about returns through the lens of psychological mechanisms. Furthermore, our research offers practical insights for retailers by illuminating the alignment of sustainable business goals with an optimal consumer experience in the realm of returns.

Key words: returns; triple bottom line; information disclosure; avoidance; gatekeeping; consumer decision-making; logistics and supply chain management

Framing of the research. Consumer returns are an increasing issue for retailers. Returns accounted for about US\$800 billion in 2023, corresponding to 14.5% of total retail sales (National Retail Federation, 2023). The surge in return volumes, primarily driven by lenient return policies, poses substantial sustainability challenges (Abdulla et al., 2022). However, consumer returns are not just an economic problem for retailers; they also negatively impact the environment and society (Paul, 2024), as reflected in the triple bottom line perspective (Elkington, 1998). Annually, 9.5 billion pounds of returns end up in U.S. landfills, while the process of handling returns generates 24 million metric tons of carbon dioxide (Optoro, 2022). Consumers recognize the looming ecological catastrophe and are increasingly concerned with the environmental impact of returns. According to the ReBOUND consumer survey in 2020, “74% of consumers say that they intend to shop more with brands that are making their delivery and returns processes more sustainable”, while 71% of shoppers reveal that “they’d be willing to pay more to return via a more sustainable return option” (IMRG, 2021). In terms of the social impact of returns, retail workers’ paychecks are negatively affected by lost commissions due to opportunistic and fraudulent returns (Abrams, 2016).

In recognition of the acute consequences that stem from ignoring consumer returns, retailers place efficient management of returns and consumer experience among their top three priorities (Optoro, 2023). To address the first goal, the retailers leverage returns avoidance and gatekeeping actions aimed at reducing return volumes and tackling the sustainability challenges at hand. Gatekeeping includes all actions that prevent unwarranted returns (Rogers et al., 2002), such as J. Crew’s US\$7.50 return fee. Returns avoidance involves developing and selling a product to minimize return requests (Rogers et al., 2002). For example, the partial refund (i.e., an opt-out discount) offered by Threadup.com allows dissatisfied consumers to keep the item without returning it. Both actions have potentially negative consequences for consumer experience.

One way for retailers to address the goal of improving consumer experience is to move beyond the one-size-fits-all return policies and empower consumers to play a more active role as decision-makers in the return process. Up to now, the literature has investigated the factors that drive managerial decision-making concerning returns, where consumers are only considered as passive recipients of such decisions. Abdulla et al. (2022) find that consumers strongly prefer policies without return fees; however, offering free return shipping implies that costs outweigh gains for retailers (Patel et al., 2021). Thus, free returns are not an optimal option for retailers. In the realm of supply chain transparency, existing literature suggests that information disclosure can enhance consumers' willingness to pay (WTP) for products and services (Duan et al., 2019; Jiang et al., 2021). In sum, as consumers become more involved in logistics and supply chain management processes (Esper et al., 2020; Daugherty et al., 2019) and more concerned about returns impact (IMRG, 2021), it is crucial for retailers to integrate consumer decision-making about returns with the triple bottom line perspective to align their priorities, i.e., efficient management of returns and consumer experience.

Purpose of the paper. Our study delves into returns avoidance and gatekeeping activities where sustainability concerns drive retailer-consumer negotiations in a novel B2C2B perspective. Specifically, we are interested in examining how the transparency of returns' impact in terms of triple bottom line dimension affects consumers' decision-making about returns. We propose to answer to the following research questions:

RQ1. Will consumers pay a premium for sustainable returns?

RQ2. Will consumers accept a price discount to opt out of returns to help retailers meet sustainable goals?

To address these research questions, we draw upon the self-efficacy theory (Bandura, 1977; Basil et al., 2008) and the concept of psychological distance (Simpson et al., 2021; Trope & Liberman, 2010; Viet et al., 2023) to explain the social and psychological factors that drive consumer choices. More specifically, according to the self-efficacy theory, individuals' expectation of efficacy of personal behavior determines how much effort will be expended: the stronger the perceived self-efficacy, the more active the efforts. In fact, individuals' perception that their behavior leads to a certain outcome influences the choice of behavioral activities and settings (Bandura et al., 1977).

The concept of psychological distance originates from the construal level theory (Trope & Liberman, 2010), which provides a conceptual framework to explore how individuals process information and its effects on decision-making (Wiesenfeld et al., 2017). The construal level theory and psychological distance have been widely applied to investigate decision-making in other business domains, such as marketing and organizational behavior, but they have seen limited use in logistics and supply chain management. Psychological distance manifests in four primary dimensions - temporal distance (events that occur further away in the past or future); spatial distance (separated by geography); social distance (persons and cultures that are unfamiliar, or in-groups and out-groups); and hypothetical distance (lack of experience or low probability of events) (Simpson et al., 2021; Trope & Liberman, 2010; Liberman & Trope, 2014). In the context of supply chains, psychological distance holds particular relevance due to its pervasive presence in decision-making processes. Higher psychological distance generally corresponds to decision-makers' reduced awareness of specific details or the practical implications of decisions, leading to more abstract representations of objects, events, persons, and ideas. Consequently, decision-making tends to rely more on abstraction (Soderberg et al., 2014). The manipulation of psychological distance can significantly impact decision outcomes by influencing information processing (Henderson et al., 2006; Ledgerwood et al., 2010; Kirshner & Moritz, 2022). Individuals consistently adapt their behavior in accordance with changes in mental abstraction. During the final product purchase, consumers operate within a concrete mindset; therefore, they tend to exhibit stronger responses to information and issues with low psychological distance compared to those with high psychological distance (Dhar and Kim, 2007). Importantly, the psychological distance is not fixed and can be addressed and reduced through access to information (Simpson et al., 2021).

In this study, we focus on the concept of supply chain transparency as a key building block of our investigation. It is important to address the definition of this key variable as well as its adaptation and operationalization within the context of our research questions. Sodhi and Tang (2019) define supply chain transparency as the disclosure of information to the public, including consumers and investors, about the company's upstream operations and about the products it sells to consumers. Sodhi and Tang (2019) also make a case for the need to broaden this definition to include the focus of this definition to include the downstream operations in order to study the phenomena of supply chain transparency comprehensively. In the context of our study, we are interested in the disclosure of the sustainable impact of returns to consumers, which aligns with the literature on environmental sustainability disclosure (Duan & Aloysius, 2019; Mollenkopf et al., 2022). We are also interested in examining the role of supply chain transparency of different sustainability dimensions, in terms of the triple bottom line (environmental, social, economic), in the consumer decision-making process (Lee Park et al., 2023) in the specific context of returns. Hence, we build on the definition of Sodhi and Tang (2019) and we adapt it to address the specifics of our research questions. For the purpose of this study, we operationalize supply chain transparency as information disclosure about sustainable return management practices in terms of triple bottom line sustainability dimensions - environmental, social, and economic.

Methodology. The context of our research is the electronics industry. We choose this focus because the continuous increase in global electronic waste (e-waste) is one of the most alarming issues of today, as the disposal of electronic components threatens both human health and the environment (Shittu et al., 2021). According to Koshta et al. (2022), "no prior research has examined the influence of various psychological factors on end user's willingness to pay for e-waste recycling". Our study helps address this contextual gap by exploring consumers' e-waste return behavior through evaluation of their decision-making related to the return process (Ni et al., 2023).

As a first step in the research development, we start with a qualitative analysis, conducting a focus group as an effective means of exploratory data collection (Belzile and Öberg, 2012). The focus group aims to inform the research

and to ground it in practical relevance, through the formulation of general research questions based on the main goal of the research. The chosen sample of consumer participants allows us to investigate the main factors that affect consumers' choices and behavior related to returns. The focus group enables us to observe within-group interactions, which helps gain perspective on multiple facets of consumer decision-making and behavior formulation as compared to one-on-one interviews (Krueger 2014). The focus group delves into the understanding of consumers' behavior regarding returns with a specificity on electronic products. The study homes in on consumers' knowledge and awareness of the impact of returns, then focuses on the main factors affecting consumers' decision-making about returns.

Once the first analysis is conducted to inform the study, we will conduct a series of complementary experiments (Louviere et al., 2000): a scenario-based and a stated-choice study. The scenario-based behavioral experiment tests for the effect of transparency of the returns' impact on consumers' decision-making about returns. This method is chosen to isolate effects that are difficult to observe in noisy field environments (Rungtusanatham et al., 2011). The independent and manipulated variable is the transparency of returns' impact, which is operationalized as disclosure of the negative environmental impacts of returns to which consumers are sensitive. The independent variables are consumers' willingness to pay for returns and the discount accepted to opt out of returns. The mediator variable comes from the self-efficacy theory, while the moderating variable is the psychological distance, which is also manipulated.

The final step of our investigation is conducted through a stated-choice study where consumers are asked to choose their preferred option from a set of returns alternatives, each described by specific levels of sustainability attributes (Green & Srinivasan, 1990; Orme, 2020), in line with the triple bottom line perspective. In this experiment, the respondents will face multiple hypothetical sustainable return choices, where profiles of the alternatives systematically vary. Based on the chosen return option, we derive preferences towards alternatives and attributes, as well as determine consumers' willingness to pay and a level of discount to opt out of returns to help meet the retailer's sustainable goals.

Expected results. We expect to find a significant causal relationship between retailer information disclosure related to the impact of returns (i.e., transparency) and consumers' decision-making about returns. More in detail, we expect to find a positive relationship between transparency and consumers' willingness to pay for sustainable returns, and a negative relationship between transparency and accepted price discounts to opt out from returns to help retailers meet sustainable goals. Moreover, we expect the main causal relationship to be fully mediated by consumers' perceived self-efficacy and moderated by the psychological distance; increasing self-efficacy will positively mediate the relationship while increasing psychological distance will reduce the causal effects. These mechanisms will allow us to explain the social and psychological factors that drive consumer choices.

Research limitations. One of the limitations of this study pertains to the scenario-based experiment, specifically in the reliance on measuring consumers' intentions as opposed to their actual behavior. However, we mitigate the limitation by incorporating a complementary and supplementary experimental approach, namely the stated choice experiment. This approach enables the capture of intricate trade-offs, requiring consumers to make decisions within realistic constraints (Green & Srinivasan, 1990). The potential for future research emerges from this study, presenting opportunities for further exploration, such as conducting field experiments involving real retailers. Additionally, our study is product context-specific in terms of its focus on electronic products. While this focus limits the generalizability of our results, it encompasses multiple attributes of the general consumer product market. Future studies should examine the relationship in question within different product markets.

Managerial implications. From a managerial perspective, this research provides retailers with insights on aligning sustainable business goals with optimal consumer experience in the context of returns. Specifically, it can help find an equilibrium between cost-management goals and enhanced customer service levels. If transparency about returns positively affects consumers' willingness to pay for sustainable returns and/or accept a discount to opt-out from returns, the retailers should engage in a two-way communication with the consumers when managing returns. This would allow retailers to achieve their priorities of efficient management of returns and consumer experience by also tackling the triple bottom line sustainability challenges.

Originality of the paper. The originality of our research resides in its theoretical implications. In fact, our research contributes to the literature in three primary ways. First, we extend the literature on the active role of consumers in returns management. We do so through the inclusion of theoretical lenses of self-efficacy and psychological distance derived from the field of social psychology. Second, we contribute to the literature on returns by evaluating consumer response to the impact disclosure in terms of the triple bottom line perspective. In doing so we place a piece in the puzzle of literatures related to the returns management, supply chain transparency, consumer behavior and sustainability impact in term of triple bottom line. Third, from a methodological perspective, our research design demonstrates an effective approach to combining an exploratory and informative qualitative analysis and complementary experimental designs to support a unified causal inference and to provide a more integrated and complete view of the novel B2C2B perspective.

Modern slavery in mining supply chains: the role of social enterprises and the institutional context

FRANCESCO GHEZZI¹ FABIO IANNONE² FRANCESCO RIZZI³ ELEONORA ANNUNZIATA⁴
MARCO FREY⁵

Abstract

Our research focuses on evaluating the impact of institutional pressures and agency effects on modern slavery in mining supply chains in Africa. We studied the policies, challenges, practices, and supply chain's actors involved in understanding how interventions can mitigate modern slavery and promote sustainable development. In particular, we explored the role of social enterprises in modern slavery, such as those empowering women in the mining sector to address gender inequality and promote economic empowerment. By adopting a case study approach and through a combination of literature review, desk research, and interviews, we aim to provide insights that can contribute to institutional and agency theories' development and support effective strategies to combat modern slavery in mining supply chains, to achieve the Sustainable Development Goals in Africa.

Keywords: *modern slavery, supply chain, institutional theory, agency theory, esg, mining, Africa*

Framing of the research. *Africa continues to face numerous Environmental, Social and Governance (ESG) challenges, such as poverty, hunger, lack of access to good health care, lack of development, gender inequality, lack of clean water, and environmental issues (Juju et al., 2020). These challenges not only hinder the overall progress and development of the continent but also affect the quality of life of its inhabitants (Zaman et al, 2023). This objective can be achieved under the United Nations Agenda 2030 Sustainable Development Goals (SDGs), which aim to address social challenges without forgetting the environmental ones (Omisore, 2018).*

Modern slavery, particularly in the supply chain, represents one of the challenges faced by Africa. The International Labour Organization (ILO) defines modern slavery as a broad category that encompasses various forms of forced labour, including indentured labour, debt bondage, forced labour, servitude, and human trafficking. The exploitation of labour, especially in industries like mining, agriculture, and manufacturing, perpetuates poverty, inequality, lack of development (Gold et al., 2015), and environmental degradation (Sparks et al., 2021). The supply chain's unethical practices violate human rights and undermine efforts to achieve the SDGs. Hence, it is crucial for businesses and organisations to address modern slavery in their operations to contribute to sustainable development and social justice in Africa (Moussa et al., 2022).

The characteristic of modern slavery that distinguishes it from the ancient concept of slavery is its foundation on the exercise of specific powers over human beings rather than on direct property, which is currently illegal almost everywhere (Crane, 2013). As such, there are various antecedents that create the conditions for power to be exerted over workers, especially in global supply chains (Hilend et al., 2023). Among socioeconomic factors, poverty and lack of social mobility play a critical role, creating a fertile environment for any kind of labour exploitation (Crane, 2013; Hilend et al., 2023). Moreover, when the population does not have the economic and educational resources to invest in their way of life, it raises the risk of the so-called "poverty trap", where extreme poverty levels persist because of this lack of awareness (Penh, 2009). Among the regulatory factors, political instability and weak governance favour firms' likelihood of adopting modern slavery behaviours (Crane, 2013; Hilend et al., 2023).

Supply chain management (SCM) literature has demonstrated the positive relationship between the adoption of ESG practices and the supply chain performance, at least in the long term (Zhu & Sarkis, 2004; Zhu and Sarkis, 2006; Lee et al., 2012; Le et al., 2022; Truant et al., 2024). However, the work of New (2015) highlighted that modern slavery differs

from other ESG issues and necessitates specific attention, as the standard anti-modern slavery ESG initiatives can be seen as part of the enabling mechanism that allows this issue to persist: indeed, although policy statements and sustainability disclosure of firms might appear to be fighting against the problem, “the brutal exercise of commercial power, hard negotiation on prices and trading terms generates the conditions in which forced labour emerges” (p.703). However, research on modern slavery within business and management discipline remains highly underdeveloped. Under the framework of SCM, there is inadequate attention to the effects of core SCM practices in giving rise to modern slavery (Caruana et al., 2021). Flynn and Walker (2020, p. 296) acknowledge the suitability of using the institutional theory view to study modern slavery as the institutional context “is imposed on firms from the outside by legislation, non-government organisation (NGO) campaigning, professional standards, stakeholder initiatives, media coverage, and consumer activism.” In the same vein, Moussa et al. (2022) provide evidence supporting institutional theory's role in the study of modern slavery. Their research revealed that nations with robust institutions, increased democratic practices, better regulatory standards, greater press freedom, and improved corruption control demonstrate higher accountability and responsiveness to modern slavery threats. Moreover, the occurrence of modern slavery practices in supply chains may be limited or inhibited by the monitoring, governing, and enforcing of regulations related to illegal natural resource extraction (Hilend et al., 2023). However, the most influential contribution to modern slavery in the management literature was provided by Crane (2013), who conceptualised modern slavery as an institutional deflection. As a matter of fact, he offers a comprehensive and perceptive model demonstrating how the ongoing presence of modern slavery poses a theoretical challenge for institutional theory. He elucidates how illegitimate practices can endure over time within the gaps of prevailing regulative, normative, and cultural-cognitive systems. Essentially, his model seeks to elucidate the viability of modern slavery despite its contradiction to the primary institutional dynamics in contemporary societies.

In this context, two theoretical frameworks offer insights into introducing ESG criteria in supply chains to contrast modern slavery. On the one hand, institutional theory's view suggests that such practices should diminish over time due to the impact of prevailing regulative, normative, and mimetic pressures fostering isomorphism (Scott, 2001). Institutional theory in SCM has been widely studied as it may explain how external drivers promote sustainable SCM practices (Sarkis et al., 2011). Normative pressures from consumers have driven the adoption of sustainable SCM practices for downstream firms (Ball & Craig, 2010), inducing buyers to exert normative pressure over upper-tier suppliers to enforce the sustainability of the overall chain. Nonetheless, the continued presence of isolated instances of slavery indicates that within specific contexts, structural inertia resists broader societal changes and environmental shifts (Hannan & Freeman, 1984), revealing that the institutional pressures that delegitimise slavery are somehow diverted by both external and internal contingencies (Crane, 2013). In this regard, agency theory offers indeed valuable insights into supply chain management (Fayezi et al., 2012), shedding light on the relationships between upper and lower-tier supplying firms, as well as between the focal buyer and upper and lower-tier supplying firms (Aßlander et al., 2016; Wilhelm et al., 2016). By acknowledging the inherent information asymmetry and potential for opportunistic behaviour within these complex networks, agency theory helps design governance mechanisms that incentivise efficient and trustworthy behaviour from agents towards the principal. This ultimately contributes to smoother information flow, reduced transaction costs, and improved overall supply chain performance (Panda and Leepsa, 2017). Indeed, as modern slavery instances typically occur in the upstream, geographically isolated and most labour-intensive stages of the supply chains (Crane, 2013), principal-agent relations are crucial to fight modern slavery since the principal's social responsibility might lead to the resolution of conflicts of interests and the introduction of contractual incentives and information transparency, which have a proven positive influence on the effective adoption of ESG practices of upper-tier suppliers (Wilhelm et al., 2016).

Purpose of the paper. Our research focuses on evaluating the impact of institutional pressures and agency effects on modern slavery in the mining sector in Africa. By adopting a multiple case study approach, we studied the policies, practices, and actors involved in the sector to understand how interventions can mitigate modern slavery and promote sustainable development. Particularly, we explore the role of a social enterprise (Doherty et al., 2014), which empowers women in the mining sector to address gender inequality and promote economic empowerment. We conceptualize this organization as a hybrid organization (Pache & Santos, 2012), as “by spanning the boundaries of the private, public and non-profit sectors, they bridge institutional fields [...] and face conflicting institutional logics” (Doherty et al. 2014, p.418). As a matter of fact, this organization occupies a particular position into the mining supply chain, being a connector between mining communities/workers and mining companies. This supply chain positioning leads the organization to span different institutional domains and face potentially conflicting pressures. Thus, we investigate if this actor is legitimated by both sides and if it acts as a principal or an agent in the promotion of ESG practices in the mining supply chain, with a particular reference to anti-modern slavery practices. Finally, we try to uncover, from an institutional point of view, if the presence of a hybrid organization in the mining supply chain facilitates the elimination of modern slavery practices, limiting the institutional deflection phenomenon envisioned by Crane (2013). Through a combination of literature review, desk research, and interviews, we seek to provide insights that can contribute to institutional and agency theory and that can support effective strategies to combat modern slavery and achieve the SDGs in Africa.

Methodology. The research employs a case study approach (Yin, 2014), mainly based on several interviews conducted with representatives of the focal social enterprise, working and living in different African countries. The interviews' evidence was complemented by collecting secondary information and integrating it with other interviews from other sources, i.e. mining industry experts who have directly worked in the sampled African countries.

We first conducted two desk research activities, one related to exploring the normative frameworks of the sampled African countries and the other related to the review of ESG challenges in the mining sector. The first desk research was mainly on grey literature, composed of governmental reports and laws, consulting firms' reports, outlooks, sustainability

reports and mining company websites. This search informs the study of the institutional context of the different case studies considered as part of our sample. The second desk research was structured as a literature review of contributions from scientific peer-reviewed journals. We included papers dealing with ESG issues and the mining context published until 31st dec 2023. We used keywords such as environmental, social and governance or corporate social responsibility and mining or extractive and challenge or issue. The outcomes of the review led us to map the relevant sustainability challenges under the mining context's three ESG pillars (Environmental, Social and Governance). The ESG dimensions inform the design of the protocol for the interviews conducted with the organization representatives and with the other experts.

After two desk research, we formulated an interview protocol for in-depth semi-structured interviews based on previous results. We then selected 15 experts in the African mining sector to validate the regulatory framework contexts and the ESG challenges detected. We selected the informants based on a shared database of partners and stakeholders of AfricaMaVal, a Horizon Europe project on Sustainable Mining. We then added a snow-balling technique to identify further informants, based on the first sample. The validation step allowed us to identify which were the crucial challenges on the ground, and the country specific ones. Moreover, we identified with a more precise degree causes and effects of the challenges. We went much further in respect to the indirect observation through desk research and this was essential to structure the interview protocol for the following phase.

Considering our focus, the fourth and last phase consisted in interviewing the social enterprise's components in the different sampled countries. The social enterprise selected has been currently pseudonymized because, due to their job, they have been several times subjected to threats and verbal attacks. The interviews protocol was based on the results of the previous three phases, with the specific goal to understand how they perceive and react to different institutional pressures and their role in pursuing the ESG challenges faced by the mining communities/workers, with a particular focus on modern slavery. The interviews are still ongoing, and they are supposed to end in May 2024. In addition, by interviewing the social enterprise's members, we also limited the social desirability bias (Bergen and Labonté, 2020). In fact, some practices of modern slavery can be at the border of illegality and, in any case, damage the company's reputation. Therefore, interview mining companies may face this risk. At the same time and for the same reasons, including possible threats, we decided to exclude miners because of their possible problems in administrating such practices and, also, considering the possible consequences on their jobs.

Table 1 presents the different steps of data collection.

Table 1: data collection phases

DC phase	Phase 1	Phase 2	Phase 3	Phase 4
Method	Grey literature desk research	Literature review	Interviews with mining experts	Interviews
Objective	Explore the normative frameworks of the African countries under study	Map relevant ESG challenges in the mining sector	Validate the regulatory framework contexts and the ESG challenges detected	Explore the role of a social enterprise in contrasting modern slavery practices in mining supply chains
Data collected	Governmental reports and laws, consulting firms' reports, outlooks, sustainability reports and mining company websites	78 scientific papers	15 interviews	On-going

Results. As this research represents an on-going project, complete results still cannot be provided. Nevertheless, we expose some preliminary results. Phase 1 has targeted Democratic Republic of Congo, Gabon, Madagascar, Morocco, Mozambique, Namibia, Senegal, South Africa, Tanzania, and Zimbabwe. At the end of this phase, we obtained a clear pictures of mining policies in those countries. We primarily identified the social, economic, technological and environmental context of each country. Then, we review mining and mineral policies, taking care about gender issues, land-use and mineral rights, taxation and royalties, environmental and water issues, societal and community aspects, including artisanal and small-scale mining, tangible and intangible cultural heritage, and health and safety in mines. Phase 2 led to detect 270 ESG challenges, of which 85 were attributed to the environmental pillar, 117 to the social pillar and 68 to the governance one. The environmental pillar covers 8 dimensions (Air, Biodiversity, Energy, Land, Materials, Noise, Waste, Water). The social pillar has 3 dimensions (Indigenous People, Local Community, Workforce). The governance pillar has instead 5 dimensions (Business Ethics, Corporate Structure, Policies, Stakeholders, Supply Chain). All of the dimensions cover various sub-dimensions which are omitted here.

Combined results of phases 2 and 3 show that there is a great focus on challenges which happen at the local level, on all the three pillars. Environmental, social and governance issues detected jointly indicate that without poverty alleviation sustainability cannot be reached in the mining context: poverty is the cause of poor working conditions (i.e, both social and environmental) which, at the same time, foster a perpetuation of poverty, installing a vicious cycle. Our results show that poverty affects both social, environmental and governance dimensions. As a matter of fact, from the environmental point of view, poor working conditions lead to the use of cheap processing substances, i.e. mercury and cyanide, which are highly polluting for water and soil. From the social perspective, poverty sustains the existence of scarce employment

conditions among the mining workers: this ranges from artisanal miners which daily works without tools and protections, being exposed anytime to toxic substances, to the phenomenon of school dropout with kids following their parents in the working activities, perpetrating the same conditions generations over generations. Finally, regarding the governance pillar, poverty affects public policies implementation. The most serious and widespread issue is corruption which happens at all stages of the mining supply chain and normally regulates institutional relationships. Corruption leads to a difficult enforcement of policies, even where advanced legislative frameworks are present, as in the case of mostly all African countries. Our interviewed experts detected corruption is mainly led by poverty, as government officers see it as a normal and due compensation to compensate very poor salaries. Public policies implementation is also related to lack of public resources, again caused by poverty.

These results sustain our inquiry of modern slavery driven by poverty in the mining sector, its link with institutional factors, and the analysis of the role that the social enterprise under study may play in promoting anti-modern slavery practices. Further results will be available once the fourth phase, the round of interviews with the social enterprise, will be carried out and the impact of institutional pressures and agency effects on modern slavery in the mining sector in Africa will be clear.

Research limitations. Our research presents some limitations. First, our desk research has highlighted the poor available scientific outputs on the mining sector in the African context. This led us to the need of interviewing experts, which although carefully selected, expressed their opinions based on their personal experience, which could be biased in several ways. Moreover, in the fourth phase, the presence of safety threats impeded us to reach mining workers.

Managerial implications. Our paper presents interesting managerial implications both for interested scholars and practitioners. Addressing modern slavery in the supply chain is crucial for businesses and organizations to uphold human rights, promote social justice, and contribute to sustainable development on the continent.

Originality of the paper. The study of modern slavery inside the management literature lacks empirical contribution, thus we believe that our paper is an important step towards the development of modern slavery stances in the supply chain management literature. Moreover, to the best of our results, previous scholars have not yet delved in modern slavery with a combined institutional and agency theories' perspective, using the context of the mining sector in Africa.

Triadic literature in sustainable supply chain management: paving the way

CHIARA SGUIZZARDI¹ IVAN RUSSO² ILENIA CONFENTE³

Abstract

The current global scenario is characterized by complex challenges, including urgent environmental and social issues. Addressing these “grand challenges” requires the adoption of a broad perspective: supply chains are formed by multiple entities that, operating across diverse economic, social, and environmental systems, form an intricate network with wide impacts. Thus, in order to investigate the potential of their interactions on tackling such issues determines the need for a multi-tier approach, leveraging the interconnectedness of actors within the supply chain. Driven by mounting environmental concerns and stakeholders’ pressures, sustainable supply chain management (SSCM) has received great attention. However, while previous SSCM research predominantly focuses on a single organization or, at most, on its dyadic relationships with first-tier suppliers, it is increasingly evident that sustainability efforts must extend further in the supply chain to yield significant impacts. The triadic approach, which allows to grasp a multi-tier perspective and to achieve insights on supply chain or even network phenomena, can provide an extended and nuanced understanding of SSCM, acknowledging its inherent complexity and multi-tier nature. Despite its potential, triadic and multi-tier research in SSCM remains scarce, suggesting a need for further adoption and exploration. This study conducts a systematic literature review of triadic research to inform of the state-of-the-art, encouraging further studies that can grasp the complexity of supply chain interactions and dependencies on performance - and specifically on sustainable performance.

Key words: Sustainable supply chain management; triadic relationships; systematic literature review

Framing of the research. *As a global society, we are facing urgent issues that need to be tackled, such as geopolitical, economic uncertainty and increasing environmental and social concerns (George et al., 2016; Rosca et al., 2022). These issues, also defined as “grand challenges” can be addressed through multi-level action (Rosca et al., 2022), by leveraging the global dispersion and embeddedness of multiple actors in the supply chain. These actors operate in different economic, social and environmental systems, still they are tied together forming a network (Håkansson & IMP Group, 1988; Montabon et al., 2016), thus the impact of their decisions and actions spreads over. Therefore, it is pivotal to address such issues from a broader level of analysis, going beyond the internal or dyadic buyer-supplier perspective (Gammelgaard, 2023; Miemczyk et al., 2012) to adopt a supply chain or network point of view, allowing for a more comprehensive understanding of the intricate relationships and dependencies among supply chain entities.*

Ever-growing environmental concerns are driving businesses to look for ways to combine operational and financial outcomes with environmental performance. Also, firms are further pressured by legislators and governments as well as by consumers’ awareness and sensitivity towards the matter (Marculetiu et al., 2023). Considering that the greatest part of the environmental impact of most companies is not under their direct control, but it derives from activities and processes that happen along their supply chain (Eggert & Hartmann, 2021; Sundarakani et al., 2010), it is required that a company’s entire supply chain is managed with a sustainable approach in order to generate a significant impact. Coherently, there has been a surge of interest in sustainable supply chain management (SSCM) (Carter et al., 2019): in this stream of literature, most current research approaches have been derived from internal or dyadic supply chain management research (Kembro et al., 2017; Sauer & Seuring, 2018), only involving first-tier suppliers (Tachizawa & Wong, 2014). However, firms are realizing that managing the sustainability of these suppliers may not be enough (Carter et al., 2019; Tachizawa & Wong, 2014). In fact, collaboration with lower-tier suppliers (Sancha et al., 2019) and engagement with other non-supply chain stakeholders (Carmagnac, 2021) are seen as critical for improving SSCM (Fritz & Ruel, 2023). As an illustration, it is noteworthy that up to 80 percent of overall climate impact of many companies consists of Scope 3 emissions, which represent indirect emissions produced along the supply chain (McKinsey&Company, 2021). Thus, focusing on sustainability beyond the four walls (Carter et al., 2019) and extending the view on SSCM

towards multi-tier perspectives (Fritz & Ruel, 2023; Tachizawa & Wong, 2014) is necessary in order to generate the greatest overall impact. Such an extension implies the investigation of a firm's relations beyond dyadic relationships (Mena et al., 2013; Sauer & Seuring, 2018).

Previous research has established that, when aiming to grasp a multi-tier perspective and to achieve insights on supply chain or even network phenomena, an investigation needs to take into consideration at least three actors and their relations (i.e. a triad) as the unit of analysis (Choi & Wu, 2009a; Vedel et al., 2016). Indeed, triads represent the smallest (thus, tractable) unit of analysis which also allows for the investigation of relational dynamics, i.e. how a link affects another link and how a node affects another node (Tate et al., 2022). Differently, Choi & Wu (2009b) criticized the dyadic approach to researching supply chains, arguing that dyads do not capture the complexities of networks. Therefore, triads represent a useful starting point for understanding the interdependencies of sustainable supply chain management (Choi & Wu, 2009a), which involves multiple levels of analysis and is determined by the interplay of decisions and actions of various organizations and actors.

Purpose of the paper. This research aims to sensitize the logistics and supply chain management community to the extant research on triadic structures, highlighting its potential as well as its complexities, specifically in the field of SSCM. To reach this aim, a systematic literature review (SLR) has been produced (Denyer & Tranfield, 2009).

Methodology. A SLR has been conducted following established guidelines (Denyer & Tranfield, 2009; Tranfield et al., 2003) to secure methodological rigor. The process includes five practical steps. In the first step, the following research questions have been formulated:

RQ 1: Which facets of SSCM have been investigated through a triadic approach?

RQ 2: What other main themes have been investigated in triadic research?

RQ 3: What inter-organizational triadic structures are investigated in this literature?

In the second step, studies are located and selected through Scopus database and Web of Science (WoS). Consistently with previous literature reviews, "triad*" - limited in the subject area of Business, Management and Accounting - is used as a keyword in the search query to include variations and derivations (Vedel et al., 2016; Wynstra et al., 2015).

In the third step, inclusion and exclusion criteria are defined and applied to go from a sample of potentially relevant literature to the final sample. The search is limited to peer-reviewed articles, while conference proceedings and other reports were excluded to ensure quality and consistency; no year limits were imposed and all research methods were maintained in the final sample (Durach et al., 2017). The search is also restricted to nine SCM journals, whose scope is coherent with the aim of the investigation and which are recognized as encompassing the primary outlets for empirical SCM research (Carter et al., 2019). Their impact factors were also considered (Gligor et al., 2018).

The selected journals are:

1. Journal of Business Logistics;
2. Journal of Operations Management;
3. Journal of Purchasing and Supply Management;
4. Journal of Supply Chain Management;
5. International Journal of Operations and Production Management;
6. International Journal of Physical Distribution and Logistics Management;
7. Supply Chain Management: An International Journal;
8. The International Journal of Logistics Management;
9. Transportation Journal.

Moreover, as triadic relationships literature has been enriched with contributions not only from supply chain management operations management but also from marketing (Mena et al., 2013), it is reasonable to consider that relevant studies may also be published in other journals. Thus, two more journals were added to the list:

10. Journal of Business and Industrial Marketing, given its focus also on supply chain issues (Gligor et al., 2018);

11. Industrial Marketing Management, given its focus on industrial and business-to-business markets, which is relevant for the purpose of the study (Madhavaram et al., 2023; Sengupta et al., 2018).

Next, based on title, abstract and full text reading, the articles that represented studies focusing on inter-organizational triads, as conceptualized by Vedel et al. (2016) were manually selected. Thus, studies that dealt with other kinds of triadic concepts (e.g. internal triads or the resource-capabilities- performance triad) were left out. The same is true for studies that only mention a triadic context or approach in passing, but they do not contain a substantial discussion of the phenomenon (Wynstra et al., 2015)

The screening of the articles and the application of the inclusion criteria as described, yields a final sample of 94 articles (5 review articles and 89 research papers). The fourth step of the SLR method involves the analysis and synthesis of the results, to be conducted through an extraction form. The final step calls for the reporting of the results, to which a separate section of this on-going work is dedicated.

Results.

Triads in sustainable supply chain management (SSCM)

Through careful analysis of the keywords and full-reading of the articles, sustainability and SSCM emerge as an under-researched theme within the literature adopting a triadic approach, with only three articles in the retrieved corpus

(Cole & Aitken, 2020; Halldórsson et al., 2019; Sanchez-Rodrigues et al., 2010). This seems surprising because there is increasing awareness on the fact that the majority of the environmental and social impact is not under the direct control of a focal firm (Bové and Swartz, 2016; Carter et al., 2019), instead it lies within the supply chain. Thus, a triadic approach - which allows to grasp a broader and multifaceted perspective on such a complex issue - could benefit from further academic interest (Fritz & Ruel, 2023; Tachizawa & Wong, 2014). Moreover, such an approach would allow answering to researchers' recommendations to extend views on SSCM (Fritz & Ruel, 2023; Gammelgaard, 2023; Nilsson, 2019).

Main themes

Careful analysis of the articles in the corpus and synthesis of their findings (Mishra et al., 2022), together with consideration and selection of each article's keywords describing the focus of the research, guided the formation of thematic clusters (Sengupta et al., 2018). Most of this research focuses on relational factors, with main topics including interactions and relational dynamics, the nature of relationships, the governance and control mechanisms in triadic structures. Moreover, two themes are more related to supply chain-specific issues, these include servitising and services outsourcing, together with innovation emerge as debated areas.

Inter-organizational triadic structures

A broad diversity of triadic structures, involving various actors and tiers of the supply chain is revealed in the literature. Consequently, a categorization of triads as presented in the literature and a brief discussion regarding their characteristics seems an appropriate starting point to investigate whether there are differences in the topics of investigation, contexts or methods depending on the specific triadic structure being investigated. First of all, a distinction between two-tier and multi-tier triads is evidenced (Bastl et al., 2013).

Two-tier manufacturing triads represent one of the most common triadic structures investigated in SCM research as well as one of the first ones to be conceptualized (Choi & Wu, 2009b); it is formed by one buyer and two of its first-tier, upstream suppliers.

Moving to multi-tier structures, triadic configurations were first introduced in studies investigating the outsourcing phenomena (Li & Choi, 2009), distinguishing between manufacturing or service settings. Manufacturing multi-tier triads include both upstream-facing (i.e. back-end) triads - formed by the buyer-supplier link (which takes place across two tiers) and the second-tier supplier (the supplier's supplier) - as well as downstream-facing triads (i.e. front-end, customer-facing). The latter triad includes the buyer-supplier link and the buyer's customer in the investigation. While a linear diagram represents the manufacturing setting, wherein a manufacturing buyer can control the interaction between its suppliers and its customers because the latter is not in direct contact with any of the suppliers; relational dynamics change when it comes to service settings and thus the links are represented with a triangular diagram (Li & Choi, 2009). This allows to account for the direct interaction between the supplier and the buyer's customer, which does not happen in manufacturing contexts. (Li & Choi, 2009). Service triads stand out as the structure that has received the most attention: one-third of the total number of articles retrieved presents the service triad as the focus of investigation. Finally, the logistics triad was defined as "a cooperative, three-way relationship between a buyer of goods, the supplier of those goods, and logistics service provider moving and/or sorting the goods between buyer and supplier" (Larson & Gammelgaard, 2001).

Research limitations. The scope of this on-going research is to systematically review the literature about triadic structures and their relational dynamics. Moreover, the study addresses studies that investigate supply chain management issues adopting an inter-organizational triadic approach. However, despite efforts to adopt a very comprehensive search strategy, it is possible that some relevant studies investigating phenomena from a multi-tier perspective, with three entities as unit of analysis, are missed, due to the use of other keywords to describe the focus of investigation.

Managerial implications. Coherently with previous recommendations to extend views on SSCM (Fritz & Ruel, 2023), the present SLR serves as a starting point to inform supply chain and logistics scholars of the state-of-the-art of triadic approach in the discipline, encouraging further studies that can grasp the complex interactions and dependencies, together with their effects on performance - and specifically sustainable performance, within supply chain triads.

Originality of the paper. In the current business scenario, a company's performance is tied to the relationships and interactions that it has with other actors in the supply chain (may it be suppliers, customers, logistics service providers etc.) (Autry et al., 2014; Ellinger et al., 2020). Therefore, it is pivotal to recognize and address supply chain issues by adopting a broader perspective, that takes into consideration their complexity and multi-level elements (Gammelgaard, 2023; Nilsson, 2019). In order to get insights into supply chain and network phenomena, it has been argued that studies should investigate the association of at least three actors and their relations (in other words, a triad) (Choi & Wu, 2009b; Vedel et al., 2016). Recent literature has recognized the centrality of link-by-link triadic interactions and relationships for the formation of supply chains (Bals & Tate, 2018; Karatzas et al., 2016; Ralston et al., 2023); however, such an approach remains scarce in the investigation of sustainability issues in SCM literature. This may be due to theoretical and methodological complexities (Durach et al., 2021; Nilsson, 2019) as well as due to measurement issues both among researchers and practitioners, with previous studies finding lack of sustainability measures at supply chain or network level (Fritz & Ruel, 2023; Miemczyk et al., 2012).

Logistics services providers in humanitarian logistics. A bibliometric and systematic literature review

FRANCESCA CELIO¹ ALESSANDRA COZZOLINO²

Abstract

In recent years, the importance of logistics services in disaster relief operations and the capacity of logistics services providers to improve humanitarian logistics have become an increasingly interesting topic for both professionals and academics. Logistics service providers (LSPs) have recently assumed a more prominent role inside the humanitarian logistics field. Since there are very few studies on this specific topic despite its cruciality, then our work contributes to filling the research gaps, with a specific perspective on LSPs. Our first aim is to define how the scientific humanitarian logistics and supply chain management literature has been developed referring to the role of LSPs. And secondly, we aim at understanding what are the main collaborations between LSP and humanitarians inside the humanitarian logistics and supply chain management literature. This study employs a dual approach, initially conducting a bibliometric research, subsequently followed by a systematic review in order to thoroughly analyze the scientific literature on the matter and better understand the significance of the role of LSPs. The results of this research may be of particular interest to academics and practitioners in both the business and humanitarian sectors because the opportunities to involve LSPs in disaster relief operations are reflected in the best outcome for the logistics of humanitarian aid to benefit people in need.

Key words: humanitarian logistics; supply chain management; logistics service providers; disaster relief; emergency services; literature review.

Framing of the research. *The world is contending with multiple crises - such as conflict in Ukraine that has displaced over 6.3 million people; meanwhile, Afghanistan is still contending with the aftermath of a devastating earthquake felt across five provinces, impacting thousands of people; there have also been recent floods in the Dominican Republic and protracted conflicts such as in Sudan (World Economic Forum, 2024). According to the report of the Office for the Coordination of Humanitarian Affairs - OCHA (Fan et al., 2023), COVID-19, climate crisis, conflicts and catastrophes are major factors which drive up humanitarian needs in 2022, leading to the result that 274 million people need humanitarian assistance, which represents the importance of humanitarian logistics (OCHA, 2022).*

The definition of “humanitarian logistics” considers the people, resources, knowledge, and activities involved in planning, implementing, and controlling an efficient and effective flow and storage of materials (with their corresponding information and financial flows), from the points of origin to the place where they are in need when a disaster or an emergency occurs; moreover, it is crucial to efficiently and effectively coordinate inter-organizational performance, eliminate redundancy, and maximize synergy along the entire emergency supply chain relationships, from a “supply chain management” perspective (Cozzolino, 2012; Van Wassenhove, 2006; Thomas, Kopczak, 2005).

It is critical to relief operations and getting aid to where it’s needed quickly, particularly as supply chain bottlenecks and risks can easily transpire. It also comprises most of its core funding needs, with studies placing 73% of humanitarian expenditures as linked to supply chain activities (weforum.org, 2024). Amid increasing conflict and disasters, humanitarian logistics face challenges adapting to evolving humanitarian needs, requiring a careful approach to aid and logistical coordination (Christopher, Tatham, 2011). Humanitarian logistics is collaborative among stakeholders from governments, NGOs, multilateral agencies, and the private sector, especially logistics services providers - LSPs (Cozzolino, 2021; 2012). Owing to the increasing importance of logistics in humanitarian operations, LSPs have recently become more prominent (Fan et al., 2023; Kucukaltan et al., 2022; Cozzolino, 2021).

Purpose of the paper. *Since logistics and supply chain management competences are those most decisive and needed by the humanitarian sector in managing disaster relief, companies dealing with the business of logistics and supply chain management can be considered among the most useful in being able to contribute, because the company’s contributions with the greatest impact on the social sector use “core business skills” (Kanter, 1999; Van Wassenhove, 2006). Companies with their core business in logistics and supply chain management are the so-called “logistics service*

² Sapienza University of Roma
e-mail: alessandra.cozzolino@uniroma1.it

providers” - LSPs: by virtue of their competences, they can play a crucial role in managing logistics activities and the coordination of relationships along the supply chain, as it is needed in humanitarian disaster relief operations that represent very complex logistics operations (Cozzolino, 2021; 2012).

According to this consideration, our first research question is:

RQ1 - How has the scientific humanitarian logistics and supply chain management literature been developed referring to the role of logistics providers?

In the report of OCHA (OCHA, 2022) has been declared that ‘the private sector has been a key ally during COVID-19. Greater collaboration is needed to systematically include the private sector in humanitarian coordination systems’, which shows the importance of cooperation between relief organizations and private sectors. Business-humanitarian collaboration seeks “to build on synergies between the business and humanitarian communities to advance humanitarian objectives and at the same time support CSR” (Andonova and Carbonnier 2014, p. 350). Companies often provide a mix of “cash donation, in-kind donation of goods or services, the provision of technical or managerial expertise, cause-related marketing, employee giving schemes and sponsoring, or logistical support and collaboration specific to field activities”; in such cases, the humanitarian organization that is involved generally “grants its corporate partner the possibility of using its name or logo in public communication, thus creating a public association of image or brand between the two parties” (Andonova and Carbonnier 2014, p. 350). In particular, similar statements can be found in other academic sources, i.e., Tomasini and Van Wassenhove (2009) determined that relief organizations and private sectors, in particular with LSPs, can benefit from cooperation. Also, evidence shows that suitable cooperation between relief organizations and LSPs is an efficient approach when responding to a disaster or an epidemic.

According to this consideration, our second research question is:

RQ2 - What are the main collaborations between LSP and humanitarians inside the humanitarian logistics and supply chain management literature?

Methodology. This study was conducted via a bibliometric literature review (BLR) and a systematic literature review (SLR) aimed at thoroughly investigating the themes and identifying the primary research areas associated with the domain of humanitarian supply chain and LSPs. The objective was directed towards identifying trends, potentialities, and advancements within the field (Tranfield et al., 2003; Durach et al., 2021). To address the first research questions, it was necessary to firstly select the dataset. On that perspective, the Scopus database was chosen, given its prominent relevance on an international scale for scientific publications. The contributions analyzed were selected with the aim of studying the role played by LSPs in the humanitarian logistics and supply chain management literature. The initial dataset retrieved from Scopus encompassed 177 articles, spanning from 2005 to 2023, the starting point being dictated by the year in which the first paper adhering to the search criteria was published. Subsequent refinement based on publisher type narrowed the dataset down to 151 articles, excluding all papers not published in academic journals. The final phase of selection excluded publications that were thematically distant from the core field of supply chain management and humanitarian logistics. The final dataset was formed by 105 documents, dement congruent with the research objectives. Our dataset has been analyzed using Bibliometrix, a package available on Rstudio. It allows the study of the selected publications by employing graphic maps and tables (Aria & Cuccurullo, 2017; Cucino et al., 2021). Subsequently, we used VOSviewer, a specific software designed for the visualization of bibliometric networks and clusters, to finalize the research (Van Eck and Waltman, 2014). As a second step, a systematic literature review - that allows an evidence-informed approach to identifying, selecting and analyzing secondary data - has been conducted following recognized guidelines to assure rigor in the methodological process (Denyer & Tranfield, 2009; Tranfield et al., 2003). We have considered the literature analyzed by the bibliometric research and other references were added manually as they reported inside the text specific name/s of LSPs and their collaboration within the context of humanitarian logistics. After that we have chosen the ones that explicitly mentioned the collaboration with the Logistics Cluster or the World Food Programme as leader of the LC or the participation in the Logistics Emergency Teams initiative (LETs).

Results. The analysis aimed to explore the trajectory of research on the topic of humanitarian logistics in recent years. A comprehensive sample of 105 documents was analyzed, originating from 75 different sources, and classified as follows: 83 scientific articles, 9 book chapters, 1 book, 1 note, and 2 reviews. Table 1 delineates the primary characteristics of the analyzed documents through the accessible R interface, encompassing the sample description, document contents, author collaborations, and document classifications.

Source: our elaboration

The relevance of the themes under investigation is evident, the number of publications on humanitarian logistics and supply chain management, specifically concerning LSPs, increased in the last two decades. The following Figure 1 shows the annual scientific production. The topics under review have witnessed increasing relevance within the scientific literature and reached their peak in terms of the number of publications in the year 2021.

Figure 1: Annual Scientific Production

Source: our elaboration

To deeply understand the dimensions explored by articles related to the theme of humanitarian logistics, supply chain management, and the specific role of LSPs, a thematic evolution analysis was conducted. Analyzing the thematic evolution of specific themes and understanding how they changed and evolved over time in the scientific literature is useful to better understand the main dimensions on which scholars have focused most.

The idea behind the representation in Figure 2 is to see how certain thematic areas evolve and change over time. It entails a bifurcation into two phases, offering a depiction of the scenario before and after a specific "cutting" moment. It shows on the left the main thematic areas that have had an important impact on the scientific literature from 2005 to 2020; on the right, it presents the themes pertinent to the years 2021 to 2023. Topics that appear only in the initial time slices and do not continue represent areas that have decreased in focus, possibly due to the resolution of earlier concerns or the shift of the academic community's interest to more pressing issues. This graph can help researchers identify trends over time, emerging themes, and potential areas for future research. The selected cutoff year was 2021, the year following the pandemic and COVID-19 restrictions, precisely because it represents the year of greatest change and adaptation to the new post-pandemic situation. Furthermore, according to Mami Mizutori, Special Representative of the UN Secretary-General for Disaster Risk Reduction, 2020 was also the year "that set new records for the number of people requiring humanitarian aid and support" (UNDRR - Annual Report, 2020). Since 2021, the keyword "logistic service provider" has begun to emerge as a primary keyword within research related to humanitarian logistics, due to the increasingly central role these operators play in the supply chain management field.

Figure 2: Thematic evolution of the keywords

Source: our elaboration

After studying the thematic evolution of research in recent years, it was essential to proceed with the analysis of the main themes and dimensions being investigated by scholars. The study of the most frequently used keywords is essential for grasping the dimensions explored by the current academic literature. The thematic analysis (Figure 3) provides an additional point for reflection, offering insights into how scholars have approached specific topics over time.

Figure 3: Thematic analysis of the keywords

Source: our elaboration

In Figure 3, the most used keywords in the articles are plotted on a Cartesian plane, represented based on their level of development and relevance. It becomes apparent, particularly in the aftermath of recent natural disasters (e.g., Fukushima, 2011), and after the 2011 annual meeting of the UN Global Logistics Cluster (Stadler and Van Wassenhove, 2012), that the role of LSPs in Humanitarian Logistics has become increasingly central to operations of emergencies' prevention and management.

The keyword “antennas” emerges as particularly interesting due to its dual application and the emerging/niche position it is covering on the map. The first application has a focus on the research strands concerning the delivery of medical supplies through aerial support in humanitarian emergencies (Ghelichi et al., 2021). The second application focuses specifically on the RFID technology, which enables companies to monitor their supply chain workflow, yielding more actionable data regarding manufacturing equipment, inventory, asset management, and company processes, thereby enhancing the effectiveness and performance of supply chain management (Zare Mehrjerdi, 2010).

Subsequently, in order to answer precisely to RQ2 a systematic literature review was conducted. Table 2 shows the collaborations of LSPs with WFP/LC that are reported and described in the articles reviewed.

Source: our elaboration

Long-term partnerships have been identified, particularly the “Moving the World” initiative of TNT, a third-party logistics company and World Food Programme (WFP) (Tomasini and Van Wassenhove, 2009). In particular, the LSPs belonged to Logistics Emergency Teams (LETs) (with different compositions along the time, and now composed by Agility, A.P. Moller Maersk, DP World and UPS) and collaborating with the United Nations Logistics Cluster/World Food Programme (WFP) represent an example of best practices and a unique partnership between profit and non-profit sectors in CSR (Stadler and Van Wassenhove, 2012; Cozzolino et al., 2017; Cozzolino, 2012; 2021). This is the first (historically) and still the only international experience of multi-company integrative partnership that has focused on logistics services and been composed of companies in the logistics sector with humanitarians that work in emergency responsiveness: LETs in collaboration with the WFP, as a Global Logistics Cluster for the entire system of the United Nations and other organizations that belong to the international humanitarian community (www.logcluster.org). We have chosen to focus on collaboration with WFP because after the reform of the 2005 - the Humanitarian Response Review (HRR), established in August 2005 that created the Cluster Approach - the WFP became the leader of the Logistics Cluster for the United Nations and most of the humanitarian organizations.

Research limitations. This paper is not free from limitations. The main limitation is that the paper is still a work-in-progress; this implies that the findings and interpretations presented are preliminary and subject to refinement with further research we are working on. Other limitations are also insights that merit acknowledgment and consideration for future research directions. Firstly, the reliance on the Scopus database, while beneficial for its comprehensive coverage and international relevance, may inadvertently exclude relevant studies published in journals or databases not indexed in it. Secondly, the methodological focus on bibliometric and systematic literature review, while rigorous, inherently limits the scope of inquiry to published academic articles, excluding gray literature, internal reports from humanitarian organizations, and firsthand accounts from logistics service providers. Thirdly, as the field of humanitarian logistics and the role of logistic service providers continue to evolve, ongoing analysis and updates to the literature review will be crucial for maintaining relevance and accuracy. Future studies could aim to incorporate broader data sources, include more recent developments, and explore underrepresented themes to build upon the foundational insights provided in this analysis. Lastly, this study needs to be deepened, in its empirical investigation, with an on-field analysis, which requires a further detailed examination that extends the understanding of collaborations opportunities and criticalities between humanitarians and logistics services providers. This could be achieved by questionnaires for and semi-structured interviews with the professionals engaged in the disaster relief operations.

Managerial implications. For practitioners, both in the commercial and in the humanitarian sector, this paper provides manifold managerial insights. The study considers how to make it possible to concretely help people in need by reaching them through the various humanitarian relief operations where humanitarians and logistics service providers collaborate. Moreover, it can be a good basis for a constructive dialogue to build new projects to achieve further goals in the humanitarian context. Furthermore, the COVID-19 pandemic has aggravated the context of the global crisis, and the need for coordination arises as an even more burning topic. As declared in the “Financial Times” (22 April 2020), the pandemic crisis has underlined the need to work together for the vital safety of single actors and entire supply chains: transforming their supply chains to “just in case” models (FT, 2020). The collaborations investigated in this research sustain the supply chains in this direction, through concrete and effective coordination, and it may be of example for other realities, in humanitarian contexts as well as in commercial ones.

Originality of the paper. Since the 2004 tsunami, companies and aid organizations have been evaluating the ways in which they could collaborate together most fruitfully in a humanitarian context. The involvement of private sector companies, especially logistics services providers, has grown considerably in relief operations inside the humanitarian action in recent years, and a “burning” imperative has emerged in academic and professional contexts: logistics in humanitarian action makes the difference between successful or failed results in the humanitarian operation, and it represents the costliest part of any disaster relief, accounting for about 70/80% of the total costs in each disaster operation. This imperative leads to the consciousness of the need for a more in depth understanding of the effective private sector-humanitarian logistics engagement meeting the challenge of preparing for/responding to disasters. Since there are very few studies on this specific topic despite its cruciality, our work contributes to filling the research gap, with a specific perspective on LSPs.

This study pioneers a comprehensive bibliometric analysis of scientific publications in the domain of humanitarian logistics and supply chain management, focusing specifically on the evolving role of LSPs. Through this approach, we have illuminated the trajectory of scholarly discourse and pinpointed pivotal themes within the field. Notably, our study reveals the increasing centrality of LSPs in facilitating effective and efficient humanitarian responses. Secondly, this

investigation extends beyond traditional narrative reviews by integrating bibliometric mapping and systematic literature review techniques. This dual approach allows to capture the multidimensional landscape of LSPs contributions to humanitarian logistics, offering a nuanced understanding of their roles, challenges, and opportunities for enhancement. Furthermore, the study breaks new ground by delving into the specific collaborations between LSPs and humanitarian organizations, a relatively underexplored area in the literature.

Eco-packaging innovations in paper and cardboard. Preliminary insights from cognitive mapping on international projects

ALESSANDRA COZZOLINO¹ PIETRO DE GIOVANNI²

Abstract

The presence of packaging along the supply chains is pervasive, both as product itself and as product-packaging combination. Due to its pervasiveness along supply chains, packaging carries great importance in achieving sustainable goals and targets, over the entire packaging life cycle - from production, through to distribution and transport, to use and disposal. In particular, the environmentally sustainable impact of packaging has been in the last years an increasingly important issue for businesses. The European Commission places packaging among the “key product value chains” for circularity. Despite its cruciality, the academic literature presents gaps in the study of eco-packaging innovations undertaken by firms to concretely improve environmental sustainability. Then our work contributes to filling the research gaps, with a wide perspective investigating which are the environmentally sustainable practices that firms adopt in innovating packaging - in particular in paper and cardboard materials - and what are the implications of these practices on packaging logistics aspects. To accomplish the objectives of this study, a qualitative content analysis was conducted using cognitive mapping on multiple cases of eco-packaging innovations at international level.

Key words: packaging; innovation; environmental sustainability; logistics; circular supply chain; cognitive map

Framing of the research. *The presence of packaging along the supply chains is pervasive, both as product itself and as product-packaging combination (Silva and Pålsson, 2022; Cozzolino, 2021). Due to its pervasiveness along supply chains, packaging carries great importance in achieving sustainable goals and targets (Fitzpatrick et al., 2012), over the entire packaging life cycle - from production, through to distribution and transport, to use and disposal (Kozik, 2020). It is precisely the packaging “logistics” processes that make product packaging possible, flowing through the entire supply chain and defining interaction with the physical environment and the socio-economic context (Cozzolino, 2021; Vernuccio et al., 2010). Thus, the idea of “sustainable” packaging logistics has been growing in academia and professional contexts (Cozzolino, 2022; Cozzolino, 2021): many authors have emphasised the close relationship between the concepts of packaging and logistics processes - both forward and reverse - along the supply chain (García-Arca et al., 2014; Azzi et al., 2012; García-Arca and Prado-Prado, 2008; Hellström and Saghiri, 2007; Verghese and Lewis, 2007; Saghiri, 2002; Lockamy, 1995; Twede, 1992).*

In particular, the environmentally sustainable impact of packaging has been in the last years an increasingly important issue for businesses (Verghese and Lewis, 2007; Hellstrom and Nilsson, 2011; Nguyen et al., 2020; Cozzolino and De Giovanni, 2023). It clearly emerges that packaging influences, at least, product development and design, purchasing, production, and distribution (Min and Galle, 2001; Ahmad et al., 2018; Meherishi et al., 2019). In fact, the debate on the impact of packaging on the natural environment has more recently shifted towards a more holistic discussion of the impact of the packaging life cycle throughout the supply chain (Sarkis, 2003). According to a review by Silva and Pålsson (2022), research on packaging incorporates Circular Economy concepts: from this perspective, designing, making, using, collecting and treating packaging requires the implementation of a proper system to recover value from waste and the collaboration with other organizations and stakeholders, either within the same industrial sector or in different ones (De Giovanni and Zaccour, 2014; Weetman, 2017; De Giovanni and Zaccour, 2019; Farooque et al., 2019; Zhang et al., 2021; De Giovanni and Folgiero, 2023).

In the document “Circular economy action plan. For a cleaner and more competitive Europe” by the European Commission, packaging is placed among the “key product value chains”, “where the potential for circularity is high”, together with others: “electronics and Information and Communication Technologies”, “batteries and vehicles”, “plastics”, “textiles”, “construction and buildings”, and “food, water and nutrients”³. Accordingly, the sustainability challenges posed by packaging value chains require urgent, comprehensive, and coordinated actions, contributing to the

response to climate emergencies, and focusing on reducing (over)packaging and packaging waste, driving design for reuse and recyclability of packaging, and considering reducing the complexity of packaging materials.

Focusing on packaging materials, it is possible to see how many different types of materials can be used for packaging, such as paper, plastic, steel, aluminum, wood, and glass, and various combinations among them. In particular, the recent study by Cozzolino and De Giovanni (2023) on circularity of packaging reveals that the specific type of packaging material (especially with a focus on paper and plastic) can change firms' preferences regarding sustainable practices they want to adopt, so that going in deep with a focus on a single material may be of great interest for academia and practitioners to relay understand concrete implementations.

Purpose of the paper. The aim of this work is to understand which are the main environmentally sustainable practices in innovating paper and cardboard packaging. In particular, our attention is on those eco-packaging innovations that are concretely realized and implemented by firms. So that the paper aims at investigating firstly the following research question:

RQ1 - Which environmentally sustainable practices do firms adopt in innovating paper and cardboard packaging?

Our attention is also on the importance of the logistical implication linked to the eco-packaging innovations. So that the paper aims at investigating secondly the following research question:

RQ2 - What are the implications of these practices on packaging logistics aspects?

Among different packaging materials, paper and cardboard ones receive significant attention for many reasons, at least: as it is the most used packaging material worldwide, accounting for approximately 33 percent of packaging material consumption (Statista, 2022⁴); as, it is made by a natural, biodegradable, and bioavailable cellulose polymer, increasing popularity in the field of packaging, especially food packaging (Liu et al., 2021); as, paper and paperboard packaging is found wherever goods are produced, distributed, marketed, used (Kirwan, 2012), and even in return processes (Lai et al., 2022); as, its recyclability is achieving very high percentage in line with the European directive targets, as the EU27 recycling rate of paper and cardboard packaging waste, based on the latest data available, is 82%, and Italy, in particular, reaches 85.1%, exceeding the target set for 2030 (Ansa, 2023)⁵; and, as it can be a valid substitute of plastic packaging very often (Silva and Molina-Besch, 2023); last but not least, as it has become a global issue with the recent virgin paper shortage problems at international level (Forbes, 2022)⁶.

Moreover, to the best of our knowledge, previous studies mainly focused on single or few case studies which consider very specific aspects of packaging innovations towards sustainability (Albrecht et al., 2013; Koskela et al., 2014; Dominic et al., 2015; Saraiva et al., 2016; Geueke et al., 2018; Abejón et al., 2020; Ferrara and De Feo, 2020; Lo-Iacono-Ferreira et al., 2021; Accorsi et al., 2022; Sasaki et al., 2022; Silva & Molina-Besch, 2023), with the exception of the work by Cozzolino and De Giovanni (2023), that studies portfolios of sustainable practices for packaging in the circular economy with a wider empirical investigation from many firms perspective, as we develop in this research.

Furthermore, the aspect linked to packaging logistics is of great interest, considering not only the implications of the innovations on transport and handling activities (such as improvement of warehousing and display operations, optimization of loads on pallets and means of transport, etc.), but also the implications in terms of the "packaging system", for each level (primary, secondary, tertiary) and in terms of interactions between the different packaging levels, as defined by Twede (1992).

Methodology. To accomplish the objectives of this study, we have first of all reviewed the international academic literature that focus on sustainable practices implemented for the circularity of packaging in paper and cardboard, to better document the existing studies and properly highlight the research gaps that we aimed to fill. After that, a qualitative content analysis was conducted using cognitive mapping to elicit the main practices adopted in eco-packaging innovations in paper and cardboard. We used data available through the "National consortium for the recovery and recycling of cellulose-based packaging" (Comieco) in Italy. It is part of the Conai system (the "National consortium of packaging"), that is a private system, which operates on a non-profit basis, to which over one million companies that produce and use packaging (in steel, aluminum, paper, wood, plastic, bioplastic, and glass) adhere at Italian level.

Comieco manages the system of collection and recycling packaging of cellulose origin in Italy, bringing together paper mills, producers, transformers, importers and recyclers of paper and cardboard for packaging. It also engages in prevention activities, through the support of studies on sustainable packaging. Among the prevention initiatives, Comieco "Best Pack" database project collects the most deserving cases of eco-packaging in paper and cardboard which best represent sustainable solutions on the market, and which have obtained recognition at national and international level, thanks to interventions on the product or on the process, from design to consumption and disposal: this approach can be summed up by Comieco in the concept of "prevention" so that these cases are defined as "the champions of prevention".

We have collected each awarded case and we have built up a database considering the following information: firm's name and the one of the specific case, a short text description of the innovative initiative, including the type of circular action, the type of intervention, the type of structure; other information we have collected are about the use destination, such as for industry or for the final customer, and the product category, if for food or not. The type of "circular" action investigated are reduce, reuse and/or recycle. The "reduction" practice mapped by Comieco refers to these category options: savings on raw materials/lighting, reduction of energy consumption/greenhouse gas emissions, and reduction

⁵ https://www.ansa.it/ansa2030/notizie/asvis/2022/12/30/litalia-ricicla-il-72-dei-rifiuti-e-avanza-sulla-raccolta-differenziata_fcdd06dc-edec-40c1-ad54-7e0cf2976344.html

⁶ <https://www.forbes.com/advisor/personal-finance/current-shortages-usa-prescription-drugs/>

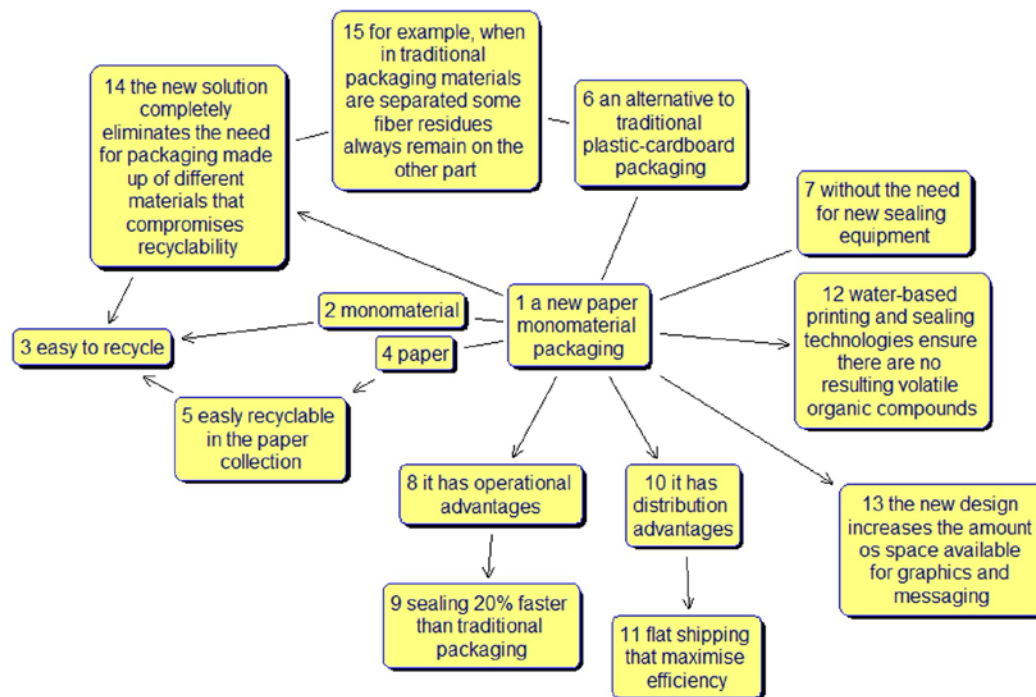

of product waste and production waste; the “reuse” practice considers the same use or also other intended use of the packaging; referring to the “recycle” practice, the options mapped are facilitation of recycling activities, use of recycled materials, and use of biodegradable materials/compostable.

Results. From the total numbers of cases of 725 innovative eco-packaging cases of cellulose origin, 284 cases present logistics optimizations effects after the innovations, and among them we started to select the 11 most recent cases, that have been analysed more in deep, using cognitive maps method. We have drawn 11 different cognitive maps, one for each case. Cognitive maps are “significant mental representation of reality” as it is perceived and described by a given subject (Weick and Browning, 1986). The design of the cognitive maps was performed with the assistance of Decision Explorer© software (Ackermann, Eden & Cropper, 1992).

Different type of intervention has been carried out on packaging to achieve the sustainable objectives and it can take place through update/redesign of a packaging, design of a new packaging or a new component, and optimization of production processes (e.g. process simplification, reduction of process waste, reduction of production time).

The analysis of the cognitive maps allows us to highlight the eco-packaging innovations implemented, if and how the interventions that have been realized on them are connected to each other (causally or not), and/or to other concepts. Also, it is possible to underline what are the most frequent innovative interventions. Moreover, the logistical implications emerge as concrete advantages from the innovation. Some innovative interventions are highlighted that have an impact not only on environmental sustainability, but also there are areas of integration among marketing, logistics, operations, and ethics in packaging innovation: in the figure, for example, concept n. 13 for marketing (“the new design increases the amount of space available for graphics and messaging”), n. 8 and 9 for operations (“it has operational advantages”, “sealing 20% faster than traditional packaging”, etc.). Some results present tradeoffs among practices, as well as the operational and logistical challenges that firms face whenever they seek to integrate environmentally sustainable practices into their operations as underlined by Pålsson and Sandberg (2020; 2022). Furthermore, some practices may require coordination with external parties, making management even more difficult. These preliminary considerations can represent food for thought for future lines of research.

Research limitations. This paper is not free from limitations. The main limitation is that the paper is still at a work-in-progress step of development; but we are already working to improve the research. Firstly, the maps have to be created and analyzed from all the cases inside the database of innovative projects, to have a complete overview of what has done by the involved companies. Secondly, it needs to be deepened, especially in its empirical investigation, with an on-field analysis, which requires a further detailed examination that extends the understanding of packaging innovations towards sustainability, considering both opportunities and criticalities in implementing them; this could be achieved by questionnaires for and semi-structured interviews with the professionals actively engaged in packaging design and utilization.

Other limitations are also insights for future research. For example, future research can replicate our study by either using a sample not belonging to Comieco, investigating a different population of firms and projects, or focusing on specific sectors. Furthermore, we rely on environmental innovations, but it worth analyzing also social innovations in

packaging. Moreover, future research could integrate the field of packaging sustainability with digital technologies. Finally, future research could incorporate the evaluation of packaging innovations on performance measurement through Life Cycle Assessment - LCA methods (starting for example at least from indicators such as reduction in CO₂ emissions, energy usage and water consumption). The authors are currently studying along this direction.

Managerial implications. This research can support managers and policymakers who are interested in eco-packaging innovations in an economically viable manner, focusing on reduction in both (over)packaging and packaging waste and driving designs for packaging reuse and recyclability. Our study aims to offer a roadmap for decision-makers, managers and policymakers who are involved at various levels in their organization and are interested in understanding interventions, results and consequences of implementing sustainable practices to improve circularity of packaging, its products and their value along the supply chain. Moreover, since the packaging design phase, from the generation of the product idea to its production, is becoming more crucial - as recent research reports cited in Forbes (2022⁷) that underline how eco-packaging emerges as a key trend in the market - our research goes in the direction to a concrete understanding of opportunities and criticalities in the implementation of eco-design initiatives (Ahmad et al., 2022). Ahmad et al. (2018) report that the design phase is responsible for about 80% of the sustainability impacts of products.

Originality of the paper. This research enriches existing literature by examining practices for eco-packaging innovations that are combined together to improve environmental performances along the supply chain; and, concrete managerial implications arise, as eco-design innovations for packaging emerges as a key trend in the market. Since there are very few studies on this specific topic despite its cruciality, then our work contributes to fill the gap of the academic literature underlined by the previous work by Cozzolino and De Giovanni (2023). Also, it introduces the cognitive mapping method for the analysis of the topic. Along these original elements we expect concrete results and implications in the direction of understanding how firms transform their packaging to overcome the manifest sustainable challenges they face in these turbulent times. The real cases analyzed represent innovative “best practices” inside their sectors and provide preliminary concrete evidence that could inspire research and practice along this way. Then this study is a starting point for future steps on this topic, at both the theoretical and empirical levels.

Strategic reshoring: redefining competitiveness in global markets

SIMONE LUONGO¹ VALENTINA DELLA CORTE² ENRICO DI TARANTO³

Abstract

Global transformations, from pandemics to geopolitical concerns, are reshaping strategic management, driving a reshoring trend in the Italian fashion industry. This study explores the impact of global shocks on strategic approaches, motivations for reshoring, and implications for competitiveness and sustainability. Findings reveal a shift toward relocating production processes led by rising costs and supply chain concerns. Despite the benefits, reshoring poses complexities such as upfront costs and regulatory challenges. Integrating reshoring with business ecosystems fosters collaboration and innovation, improving resilience and competitiveness. Being focused on the fashion industry in Italy, the study recognizes the limits of generalizability and emphasizes the dynamic nature of reshoring trends. The originality of the study lies in its focus on the fashion industry and the integration of reshoring strategies with local ecosystems, offering theoretical and practical insights for strategic management.

Keywords: country of origin; fashion industry; reshoring; Italy.

Framing of the research. *In recent years, the global arena has experienced unprecedented transformations, characterized by a series of upheavals ranging from pandemics to ecological crises, from geopolitical tensions to changing political dynamics (Napier et al., 2024). This rapid pace of change has been remarkable; starting with the emergence of the COVID-19 pandemic, followed by subsequent global environmental disasters and conflicts, there have been significant transitions in the geopolitical landscape (Brands and Gavin, 2020). These events have left nations and regions debilitated, disrupting the once-stable foundations of societies around the world and dissipating the sense of soundness of economies previously considered secure and robust. Consequently, countries are facing new vulnerabilities that require a reassessment of strategic approaches at both macro and micro levels (Cui et al., 2023). Evolving geopolitical landscape and the rise of new power structures on the global stage present long-term strategic considerations that require attention. In this intricate context, the capacity to anticipate and respond effectively to evolving challenges and opportunities is imperative to the resilience of organizations (Sudan et al., 2023). As a result, businesses face a myriad of pressures. On one side, they must deal with the repercussions of crises such as pandemics and environmental disasters (Salunkhe et al., 2023). On the other, they face increasing challenges to react, innovate, and gain competitive advantage in an uncertain environment (Vecchiato, 2015; Teece and Leih, 2016). In response to this transition, in which the extraordinary has become routine, businesses are urged to develop new visions, business models, and strategies different from those arising from the classic globalization model. Rather than adhering to backward methods that emphasize efficiency and scale, companies are encouraged to focus on restructuring value chains and cultivating new business ecosystems to mitigate a wider range of potential shocks and thrive in this rapidly changing environment. Indeed, the traditional model of internationalization, which relies on interlinked global supply chains and widespread outsourcing, is increasingly under examination in light of recent global disruptions (Gölgeci et al., 2023). Over the past two decades, international markets have drastically changed their conditions regarding the appeal of countries seeking internationalization. In a highly turbulent global environment, country risk extends beyond specific territorial contexts to encompass at least half of industrialized countries. Multinational corporations have engaged in reorganization efforts aimed at shortening and addressing emerging supply threats, starting with local supply chains, a phenomenon further exacerbated by well-documented pandemic events (Etamad, 2020). The COVID-19 pandemic has exposed the vulnerabilities embedded in complex and globally integrated supply chains, such as spreading outages and breakdowns in transportation networks, that have caused production to stall in many sectors (Deloitte, 2020; Rinaldi and Bottani, 2023). In a similar vein, environmental issues and geopolitical tensions revealed the risks associated with excessive dependence on distant suppliers and volatile regions (Newman and Visoka, 2023). Instead of focusing exclusively on reducing costs and optimizing efficiency, organizations should prioritize flexibility and adaptability to effectively juggle an environment characterized by insecurity and instability. This requires a fundamental shift in mindset, with companies*

³ University of Napoli Federico II
e-mail: enrico.ditaranto@unina.it

recognizing the urgency to embrace change and innovation as ways to secure long-term competitive advantage (Afraz et al., 2021). At the core of this ongoing transformation is the recognition of the importance of reconfiguring value chains to align them more closely with current reality. Instead of depending on sprawling, failure-prone global supply networks, businesses are constantly exploring the benefits of shorter, highly localized supply chains, which provide stronger control and greater resilience (Thilmany et al., 2021). By relocating production close to their home countries and decreasing dependence on distant suppliers, companies can alleviate the risks associated with global disruptions while reducing their ecological impacts (Polyviou et al., 2023). The creation of extensive global value chains and the process of internationalization are realities recognized by business scholars and practitioners alike. However, a new trend that is substantially reshaping international development processes is second-degree offshoring (Barbieri et al., 2019; 2022). In parallel, there is a growing recognition of the need to nurture new entrepreneurial ecosystems able to foster innovation and expansion in an uncertain environment. This requires the creation of interconnected networks that include companies, startups, and other stakeholders that can cooperate and pool resources to pursue common objectives (Jocovski et al., 2020). By cultivating a climate of innovation and collaboration, companies can discover and exploit new sources of knowledge and creativity, fostering a spirit of adaptation and enabling them to thrive in an increasingly competitive environment.

Purpose of the paper. Over the past thirty years, companies have undergone significant transformations in how they manage production processes, facing escalating challenges in maintaining vertical integration, where a company controls its suppliers and/or customers (Harrigan, 1984; Anderson and Weitz, 1986). The topics of country of origin and production decisions gained prominence in the 1980s amidst the globalization of production. It became commonplace for companies to relocate production stages and manufacturing processes abroad, driven primarily by cost-saving motives and the search for unique production resources (Jensen and Pedersen, 2011). Nowadays, pressures on companies to execute various production processes have intensified, encompassing diverse aspects, including logistics and communication. Recent years have witnessed a notable trend towards re-localization of production or even a significant shift towards deglobalization among internationalizing companies. Based on these premises, the study aims to address the following research questions:

RQ1: What effects have recent global shocks had on the strategic management approaches of companies across different industries and geographical areas?

RQ2: What are the primary factors motivating and hindering businesses in adopting reshoring strategies?

RQ3: What are the key determinants driving companies to relocate production processes or optimize value chain relationships closer to their home country, and how do these decisions affect the overall competitiveness of the ecosystem, including supply chain resilience, operational efficiency and performance?

In order to answer the three research questions, the study begins by analyzing the reshoring processes implemented by numerous companies in different industries. Our objective is to understand and discuss the strategic and operational implications of reshoring practices to provide valuable insights for both theory and practice. Economic research posits that the process of deglobalization involves three primary economic flows: the dynamics of imports and exports of goods and services at a global or regional level, expatriates' remittance of money and inflows/outflows resulting from foreign direct and portfolio investments (Postelnicu et al., 2015). These considerations of international management aim to identify both the phenomenon of firms returning to the country of origin ("back-shoring" or "reshoring") and relocating to third countries (referred to as "nearshoring" when approaching the country of origin). Moreover, the motivations behind relocation choices can have an impact not only on the location of individual firms, but also on the whole supply chain. At the same time, internationalization should be conceived as a reversible phenomenon. Therefore, if market expectations are not satisfied, it is advisable to reconsider internationalization (embracing the phenomenon of back-shoring) or explore alternative locations (thus promoting further relocation or near-shoring). However, there are other motivations to internationalize, such as the "made-in" effect. This involves leveraging the reputation of the home country to increase brand loyalty and influence customer and market perceptions of product quality. Another driving force is technological progress, which allows firms to replace manual labor with technology and reorganize previously labor-intensive activities both domestically and in other advanced markets within the home region.

Methodology. This study focuses on Italy, which serves as an intriguing case study within the realm of strategic management, particularly due to its distinctive characteristics, notably in the realm of small and medium-sized enterprises (SMEs) (Cassia and Colombelli, 2010; Zucchella and Hagen, 2015). Within this domain, there exists a diverse spectrum of companies, ranging from those with purely domestic operations to internationally oriented firms, engaging in varying degrees of global to glocal (global-local) activities. The Italian SME landscape exhibits several unique features, such as short value chains and a strong emphasis on sustainability, which not only influence its economic dynamics but also reflect broader challenges encountered by companies in the global arena (Martins et al., 2022). SMEs hold a prominent position within Italy's economic system, making significant contributions to employment, innovation, and economic growth. This research addresses the phenomenon of reshoring in the fashion industry. The "Made in Italy" clothing industry is significant, as it embodies a combination of style and quality craftsmanship. Italy has long been associated with the ready-to-wear model, which differs from Chinese fast fashion in its selection of high-quality materials and suppliers. Several Italian regions, home to renowned "Made in Italy" companies, were examined from south to north, analyzing the key factors influencing various production processes from a reshoring perspective. Reshoring has gained prominence in recent years, driven by factors such as rising labor costs in offshore locations, concerns about supply chain resilience, and a growing emphasis on proximity to markets (Chen et al., 2022). In the context of the Italian

manufacturing sector, particularly in the fashion industry, reshoring strategies have received significant attention. For example, in the Lombardia fashion system (one of the regions studied), the average distance between suppliers in the Made in Italy sector has dropped from 155 km to 100-80 km. Examining the experiences of businesses operating in the "Made in Italy" fashion industry, using Orbis and Confindustria as a reference dataset, this study aims to clarify the complexities of reshoring initiatives and their impact on production and sales processes. Through a comprehensive analysis, the study seeks to identify the specific stages of the value chain most affected by reshoring efforts, illuminating the challenges and opportunities associated with this strategic shift. It also delves into the advantages and disadvantages of reshoring strategies, offering a nuanced understanding of their implications for competitiveness and sustainability. Besides examining reshoring strategies, this study also explores the emergence of entrepreneurial ecosystems at the local level, recognizing their importance in promoting business resilience and driving innovation. Entrepreneurial ecosystems incorporate a network of interconnected organizations, institutions and stakeholders that collaborate within a specific geographic region or industry sector, playing a crucial role in fostering entrepreneurship, facilitating knowledge exchange and stimulating economic growth. The methodology adopted in this study is designed to establish a robust framework for examining the intricate dynamics of reshoring strategies and entrepreneurial ecosystems in the context of the Italian fashion industry. It integrates quantitative analysis with qualitative insights, offering a comprehensive understanding of the phenomena under investigation (Harrison et al., 2020). The survey instrument facilitated the collection of data on the prevalence and characteristics of reshoring initiatives among Italian fashion companies, capturing essential variables such as the motivations for reshoring, the specific stages of the value chain involved, and the perceived benefits and disadvantages of this strategic approach. Through a preliminary testing phase, any potential concerns or limitations of the survey were identified, and necessary refinements were made to ensure its validity and reliability (Aithal and Aithal, 2020). After the pilot test, the research moved on to conducting interviews with decision makers (entrepreneurs and/or top managers) in the Italian fashion industry. These interviews are designed to gain qualitative insights into the drivers, barriers, and strategies related to reshoring initiatives and entrepreneurial ecosystems. By directly engaging key stakeholders, the study aims to capture perspectives and experiences that quantitative analysis alone might overlook. Data collected from questionnaires and interviews are analyzed using a mix of quantitative and qualitative methodologies. Quantitative data are subjected to statistical examination to identify patterns, trends, and correlations, while qualitative data are analyzed to reveal underlying themes and narratives.

Results. The expected outcomes of this study include a deeper understanding of the characteristics of reshoring strategies among Italian fashion firms, along with an exploration of the factors and challenges that impact their adoption. In addition, the research aims to shed light on the emergence of entrepreneurial ecosystems within the Italian context, elucidating their effects on business resilience and innovation. This effort not only improves operational efficiency and adaptability, but also fosters resilience against external shocks and disruptions. By reducing dependence on distant suppliers and streamlining production processes, Italian companies are able to deal with the uncertainties and risks inherent in today's fast-changing economic scenario. Preliminary analysis indicates that the Italian fashion industry shows a strong commitment to sustainability, reflecting a growing awareness of the environmental and social impact of business operations. Interviews reveal meaningful strides toward sustainability, as Italian companies increasingly embrace eco-friendly production methods, fair labor practices, and ethical sourcing in all their operations. By examining the interplay between reshoring strategies and business ecosystems, the study uncovers potential synergies and opportunities for collaboration that can improve the competitiveness and sustainability of Italian firms. Preliminary findings suggest that reshoring initiatives allow companies to regain control of their supply chains, thereby reducing the risks associated with offshore production and improving responsiveness to customer demands. In addition, entrepreneurs express optimism about relocating production closer to home, mentioning benefits such as reduced transportation costs, improved quality control and greater protection of intellectual property. However, reshoring initiatives bring significant benefits, as well as complexities. The decision-making process related to business process offshoring involves significant upfront costs, including investment in infrastructure, technology, workforce training and identification of new trusted suppliers. In addition, reshoring can result in higher labor costs than offshore destinations, potentially erasing the cost advantages that initially drove outsourcing decisions. In addition, reshoring initiatives can disrupt established supply chain relationships and require companies to navigate regulatory complexities and market dynamics in their home countries. These issues and trade-offs are currently being explored in depth.

Research limitations. While this work offers valuable insights into strategic management practices, it is critical to recognize some limitations that delineate the scope of the research and highlight opportunities for future investigation and improvement. First, a significant limitation concerns the focus of the research. By analyzing the experiences of Italian firms regarding reshoring strategies and entrepreneurial ecosystems within the fashion industry, the study may not fully understand the diversity and intricacy of strategic management practices across different sectors and regions. Indeed, the dynamics of reshoring can vary significantly depending on factors such as industry characteristics, geographic location, and market conditions. Therefore, while the results of this research offer valuable insights in the context of the Italian fashion industry, their applicability to other sectors or regions requires further validation and exploration. The second limitation concerns the dynamic nature of the topic under investigation. Reshoring strategies and entrepreneurial ecosystems are subject to continuous evolution and change, influenced by factors such as technological advances, regulatory changes and sudden shifts in consumer preferences. Consequently, the results of this research can summarize the current state of the art, capturing a temporary glimpse of broader trends and dynamics. Longitudinal studies tracking

the progression of reshoring strategies and entrepreneurial ecosystems over time, as well as comparisons across sectors and countries, could provide valuable guidance.

Managerial implications. Outlining the strategies and approaches adopted by Italian companies, this study offers a roadmap for improving resilience, fostering innovation, and promoting sustainable growth through optimizing supply chain strategies and using local ecosystems to achieve collaborative benefits. For practitioners, the preliminary findings of this research offer practical insights to navigate the complexities of a rapidly changing business landscape. The study reveals that different models of strategic development can be profitable for companies, depending on their unique resources and capabilities in their specific contexts. In particular, the analysis provides guidance and recommendations for evaluating potential reshoring activities and considering the resources and capabilities needed to implement such strategies. This includes not only the skills and capabilities intrinsic to the firm, but also relational aspects in interactions with the whole supply chain, transforming it into a full-fledged ecosystem.

Originality of the paper. This work stands out for its originality in the context of research on strategic management and business resilience in response to unprecedented global transformations. Through an innovative approach, the work explores the phenomenon of reshoring and entrepreneurial ecosystems, focusing on the fashion industry in Italy, a choice that reflects the relevance and uniqueness of this context on the international scene. In a world marked by destabilizing events such as the COVID-19 pandemic, environmental disasters and geopolitical tensions, the paper aims to analyze the effects of these shocks on the strategic management strategies of Italian firms and the dynamics of their entrepreneurial ecosystems. Through a comprehensive methodology that integrates quantitative and qualitative analysis, the study provides a comprehensive view of the reshoring strategies adopted by Italian firms, highlighting the motivating and inhibiting factors as well as the implications of these strategies for competitiveness and sustainability. This work offers a unique and in-depth perspective on a topic of increasing relevance in the context of current economic and geopolitical scenario, providing valuable insights for the theory and practice of strategic business management.

Unpacking the “truce” in Sales and Operations Planning routine. An ethnographic study (work in progress research)

DAVIDE BONFIO¹ ANDREA FURLAN²

Abstract

In the evolving landscape of modern organizations, the last few decades have witnessed a paradigm shift towards virtuosity, marked by significant improvements in operational efficiency and performance. Key drivers of this transformation include integrating communication channels along the supply chain and implementing lean principles in production processes, coupled with the widespread adoption of digital technologies. These advancements have facilitated streamlined operations and enabled organizations to achieve unprecedented levels of financial growth.

The Sales and Operations Planning (SOP) process is central to the success of virtuous organizations, which serves as a linchpin for aligning internal resources with external customer demand. SOP entails a series of regular monthly meetings involving representatives from various functions, including Marketing & Sales, Operations, Supply Chain, and Finance. However, despite its instrumental role in fostering inter-functional alignment, SOP is often fraught with conflicts. This inherent conflict arises from divergent functional objectives, as each function seeks to optimize its performance, sometimes at the expense of others.

While existing literature acknowledges the significance of SOP in organizational performance, there remains a gap in understanding the mechanisms that lead to conflict avoidance or resolution within this process. This paper seeks to address this gap by adopting a routine-based perspective, conceptualizing SOP as an ongoing and dynamic inter-functional routine. Drawing on theoretical frameworks such as Nelson and Winter's theory of organizational routines and Dionysiou and Tsoukas's model of routine (re)creation, we aim to unpack the role of organizational routines in mitigating conflicts during SOP sessions.

Specifically, we hypothesize that increased enactment of role-taking within SOP routines leads to decreased conflicts among organizational actors. To empirically investigate this hypothesis, we propose an ethnographic study within a large manufacturing firm, wherein we will closely observe the dynamics of SOP meetings and analyze the role-taking behaviors of participants. By structuring our paper to elucidate the significance of SOP, proposing a routine-based conceptualization, detailing our methodology, and outlining our expected contributions, we aim to provide actionable insights for practitioners and scholars in organizational behavior and management.

Key words: SOP, routine, routine as a truce

Framing of the research and purpose of the paper. *In the last decades, most virtuous organizations experienced a general improvement, from integrating and streamlining the communication along the supply chain (Grimson and Pyke, 2007) to implementing lean principles in the production process, creating production flow, and reducing waste (Furlan et al., 2011; Dal Pont et al. 2008). Another facilitating factor in reaching a superior performance is the use of digital technologies and the wide adoption of integrated internet technologies from both the supply side (i.e., Industrial Internet of Things) and the demand side (i.e., marketing responsiveness and massive data gathering possible due to internet-related technologies). The result of those virtuous cycles is an improvement in the firm's ability to generate financial growth. Parallel to the benefits of technology implementations, managerial tools, and processes play an important role in continuously aligning the firm's internal resources with external customer demand. Among those processes, Sales and Operations Planning (SOP) plays a crucial role. This process consists of a series of regular monthly-held meetings in which the representatives of each function (i.e. Marketing & Sales, Operations and Supply chain, Finance) advocates its own interests (Grimson and Pyke, 2007) and through confrontation, the actors aim at finding an agreed upon aggregate production plan over the medium-term (3-18 months).*

Due to its role in inter-functional planning alignment, SOP is an inherently conflictual process (Jacobs and Chase, 2023). In planning capacity and production, each function aims to maximize its own performance, even at the expense of

¹ University of Padova
e-mail: davide.bonfio@studenti.unipd.it

² University of Padova
e-mail: andrea.furlan@unipd.it

other functions (Rotemberg and Salor, 1995; Jacobs and Chase, 2023). In most virtuous organizations, SOP consists of a clear and routinized process of monthly meetings with a clear format (Lapide, 2005).

Even if several papers have studied the benefits and inner workings of SOP, there is a lack of understanding about the mechanisms that lead to conflict avoidance or resolution during the process. In this paper, we aim to unpack these mechanisms, relying on the theory of organizational routines and interpreting SOP as an ongoing and dynamic inter-functional routine. As theorized by Nelson and Winter (1982: p.109), “[routines] largely prevent or deter individual members from pursuing their own interests along lines that are so strongly antithetical to organizational requirements as to threaten the feasibility of any coordinated performance at all.” In other words, organizational routines serve as truces among organizational actors that temporarily aligned their respective interests. To unpack how these “truces” emerge, we draw on Dionysiou and Tsoukas’s (2013) model of (re)creation of routines, exploring role-taking as a conflict-solving mechanism. We assume that the more role-taking is enacted, the less conflicts will emerge. However, we lack clarity about how role-taking takes place in actual routines. To this end, we study the enactment of SOP within a large manufacturing firm adopting an ethnographic approach.

SOP: an overview

SOP is defined as “The process that companies use to keep demand and supply in balance by coordinating manufacturing, distribution, marketing, and financial plans” (Jacobs and Chase, 2023; p.244). The coordination in planning among functions has been proven to impact different organizations’ dimensions positively. In fact, extant literature testified the effectiveness of a well-implemented SOP over different firms’ goals, such as alignment between demand and supply (Chae, 2009; Singh, 2010), alignment between various functions (Ivert and Jonsson, 2010; Paiva, 2010), and alignment between supply chain (Gianesi, 1998; Lapide, 2005). Additionally, SOP helps to improve forecasts (Bower, 2005), operational performance (Milliken, 2008), and management of uncertainty and risks (Lapide, 2009).

However, despite the proven effectiveness of this process, only a few organizations have developed sufficient maturity in SOP. Several models have been developed to measure the maturity of SOP implementation. These models are usually conceptualized as composed of three to five steps (Wing and Perry, 2001; Lapide, 2005; Feng et al., 2008; Cacere et al., 2009). Despite the differences in the number of maturity stages, all those conceptualizations share some common traits. For example, in early maturity stages, SOP meetings are held occasionally, with a loose structure and without a proper information system, and each function makes the forecasts independently to pursue each own financial goals (Lapide, 2005; Grimson and Pyke, 2007). Moreover, shifting from one maturity stage to another usually means creating a proper structure for these meetings, following a precise and described agenda, and establishing a dedicated information system that each function can update (Lapide, 2004; 2005). As firms reach more mature stages of SOP implementation, monthly meetings are anticipated by the so-called “pre-SOP meetings,” in which each function prepares its forecast, presents it in the official meeting, and all the material is shared between functions to ensure homogeneity in information availability. All the benefits mentioned before increase as companies reach more mature stages of the SOP model (Grimson and Pyke, 2007). In fact, with a proper meeting structure and information systems, it is easier to coordinate, align, and solve inter-functional inconsistencies in the planning phase, extending the coordination to other players along the supply chain (Lapide, 2005). Ideal stages of SOP maturity are very difficult to achieve (Lapide, 2005) but serve the organizations as archetypes to aspire to.

SOP as an organizational routine: truce and conflicts

Routines have been recognized as how organizations accomplish much of what they do (Feldman and Pentland, 2003; Becker, 2004). One reason for creating a routine is to create a workable level of certainty and improve process effectiveness (Weick, 1979). With their evolutionary perspective, Nelson and Winter (1982) define routines as stable and predictable action patterns and organizational genes that can be inherited and selected by the organization’s environment. Interestingly, they identify a role of “truce” to routines, meaning that they can solve intra-organizational conflicts, both manifest and latent, as long as they “stay within predictable bounds that are consistent with the ongoing routine” and “the terms [of the truce] become increasingly defined by a shared tradition arising out of the specific contingencies confronted and the responses of the parties to those contingencies. In the interpretive context of such a tradition, actions by individual members have connotations related to the terms of the truce.” (Nelson and Winter, 1982: p.110-111). Diverging from the traditional perspective that compares routines to genes characterized by highly inertial structures, with evolution relying on experiential, localized, and semiautomatic search processes (Cyert and March 1963, Nelson and Winter 1982), a body of research indicates that the tangible transformation of routines encompasses both experiential and deliberate characteristics (Gavetti and Levinthal 2000, 2004). According to this recent view, Feldman and Pentland (2003, p. 96) define routines: as “a repetitive, recognizable pattern of interdependent actions involving multiple actors.” We rely on the view of SOP as predictable patterns of collective actions to grasp and evaluate the interactions between SOP participants, unveiling the underlying mechanisms leading to conflict avoidance.

In particular, we propose a routine-based view in which SOP can be reduced to a series of recognizable patterns of actions that guide individuals’ behaviors toward a mutual understanding over the foreseeable future, mediating between each function’s own strict interest. We argue that this shared understanding among individuals is the real source of the SOP’s positive impacts on organizational performance. As mentioned before, our conceptualization of the routine-based view of SOP starts from the model of (re)creation of routine (Dionysiou and Tsoukas, 2013).

In the initial phases of routine creation, the team must establish shared mental models and meanings of what the team should accomplish (Dionysiou and Tsoukas, 2013). Initially, a team starts operating in an environment characterized by few rules and artifacts; by interacting multiple times to achieve the predetermined goal, employees can create a pattern

of actions to accomplish it. The more the routine is repeated, the more its outcome becomes certain as the pattern of actions and the scope to achieve is clearer to the employees (Dionysiou and Tsoukas, 2013). After the routine creation, it has to be sustained, and it is not possible to do it without the support of the team's norms, climate, and artifacts (Dionysiou and Tsoukas, 2013; Pentland and Feldman, 2005). We hypothesize that creating shared schemata between coworkers and the few standard operating procedures provided by the upper management makes it possible to establish a routine that can guide employees' emotions and cognition through a shared habit (Cohen, 2007). Through repetition, schemata about each component's role in the routine and the expected results will be shared. To achieve such results, at the early routine-forming stage, people perform some role-taking activities that evaluate the role of others in the process, assess the possible interdependencies, and assess their overall contribution to the routine. We stress the "role-taking" mechanism as crucial in routine formation and conflict resolution. As noted by Dionysiou and Tsoukas (2013, p. 186), "It is through taking the role of others that individual lines of action are fit together to form joint action. Each individual aligns his or her action to the action of others by identifying the social activity in which they are about to engage and by ascertaining what those others are doing (or what they intend to do) in forming the joint action." In the context of SOP, the role-taking leads to breaking the tunnel vision barrier, embedding it in the functional planning, and addressing the need for other functions, which should lead to compromises in planning future activities.

Similarly to Dionysiou and Tsoukas' model (2013), in the early stage of SOP implementation, there is no clarity on the scope of the process in participants' minds. We expect a clear routine will emerge with several interactions between function representatives as long as the participants engage in role-taking behaviors. This latter mechanism should appear as each function representative embeds other representatives' points of view in each function's forecasting and planning. By doing so, the conflicts should be reduced, and, in the event they still emerge in the meetings, it should guide participants' behavior and intentions toward finding a common solution.

A typical example of inter-functional conflict is represented by marketing and operation in planning for a promotion campaign: on the one hand, the market function decides to push a line of products to the market by designing a discount price that represents a disruption in the normal production schedule of operation. On the other hand, operations function may be considered impossible to satisfy the forecasted demand due to the need for increased production, which is not easily reachable without increasing functional costs. In this context, we argue that an established routine and shared schemata can lead to the creation of some boundary conditions in which the two functions can freely operate, avoiding conflict. For example, as testified by Zbaracki and Berger's (2011) case, through a long process of confrontation and role-taking, sales and marketing finally agreed to make 3-10% adjustments to the final price.

However, both the SOP literature and the more general literature on routine dynamics lack a thorough and detailed understanding of the mechanisms by which the actors enact role-taking, truces emerge, and conflict is solved starting from divergent goals and objectives. This is the paper's aim, and coherently with its explorative nature, to answer the research question, we delve into the SOP process of a firm adopting an ethnographic approach.

Methodology. Pentland et al. (2010) and Mahringer and Pentland (2021) stated that the most appropriate way to study organizational routines is to focus on the observational layer, meaning the performative aspect, even if the scope is to examine the generative mechanism. Coherently with Pentland et al. (2010), we decide to focus on observable actions and verify if there is a "pattern in variety" (Cohen, 2007). In other words, we want to seek a pattern of repeated actions over time to find agreement between function representatives during SOP meetings. Zbaracki and Berger (2011, p.956) noted that "describing the routine as a truce misses the conflict behind the truce; it reveals only the stable truce." Moreover, articulating the terms of a truce invariably lacks full explicitness, with particular emphasis on the intra-organizational truce, wherein explicit delineations are frequently absent. (Nelson and Winter, 1982). To overcome this issue, we build our empirical study following the methodology of Zbaracki and Berger (2011), adopting an ethnographic approach to unveil the mechanisms leading to a truce. Therefore, to shed light on routine dynamics as a truce, we focus on the interplay between actors rather than treating the routine as an entity.

As a research setting, we studied the SOP meetings of a large manufacturing firm. We seek to gather data engaging in at least six months of longitudinal study, which has three main sources:

Ethnographic Interviews. We will conduct ethnographic interviews (Spradley, 1979) with representatives of each firm's function to fully understand the context in which the SOP meeting took place and the dynamics in the company.

Nonparticipant Observation. During the SOP meetings, we will conduct nonparticipant observation, following the planning process as it focuses on observing the interaction between members of different functions and the dynamics that will occur when a problem arises. Moreover, we will evaluate the evolution of the SOP implementation, evaluating the grade of maturity and the changes that will occur through its repetition over time.

Records Data. Finally, we will record data: this source will be needed to have a clear picture of the SOP's implementation as-is state. We need to know the degree of integration of the information systems as well as the consistency in participation of each function's member. If any, we will also collect any document attesting to any conflicts that arose in the past, and, along with interviews with key informants, we will assess the process followed to solve it.

As far as data analysis is concerned, by comparing the situation of each SOP meeting and the action path it follows, we will be able to evaluate the performative aspect of this routine. In addition, by comparing our findings to records data, we can assess whether a more routinized SOP behaves like a truce routine. Moreover, by participating in the meeting, we will also be able to evaluate which form of truce mechanisms emerge.

Managerial implications. *With this empirical research, we aim to elucidate the success factors of SOP by exploring its routine nature. To do so, we adopt an ethnographic approach to assess the process manifestations that lead to conflict-avoidance and resolutions. Moreover, by studying the manifestation of the truce mechanism of routines, we want to shed light on the role of organizational routines in organizational processes. In addition, we aim to answer Zbaracki and Berger's (2011) and Pentland and Feldman's (2005) on the role of operations routines in stabilizing and changing organizations' behavior and to unveil the dynamics of "routine as a truce." These findings have strong managerial implications since a more complete understanding of the success factors of SOP as routine, along with a clearer depiction of how it manifests its mechanisms, can help management effectively implement SOP and completely enjoy its benefits.*

Which governance strategy is best for specialized investments? Insights from the weaker partner's perspective

EMANUELA DELBUFALO¹

Abstract

This study revisits the governance strategies for protecting relationship-specific investments in scenarios of power asymmetry, building upon Subramani and Venkatraman's 2003 work. We not only replicate their analysis but also expand it by examining three governance mechanisms, up from two, and incorporating an additional dimension for temporal asset specificity, which enriches the framework with a focus on intangible time-related investments. Our contributions are twofold: we empirically demonstrate the link between asset specificity and governance mechanisms in modern business contexts where intangibles and time constraints heighten the risk of opportunism. Furthermore, we emphasize the importance of replication studies in supply chain management, responding to the recent scholarly call for more research in this area.

Key words: *governance; specialized investments; replication; TCE; opportunim*

Framing of the research. *The issue of protecting investments that are specific to buyer-supplier relationships, known as relationship-specific (or specialized) investments, has been a fundamental aspect of Transaction Cost Economics (TCE) since the theory was first introduced in 1937 (Coase, 1937). Asset specificity is characterized by investments tailored to support a particular transaction, which cannot be repurposed for "alternative uses or by alternative users without a loss of productive value" (Williamson, 1991, p. 81). Companies often undertake these specialized investments to enhance productivity and generate profits (Dyer, 1996). However, pursuing increased specialization comes with its costs and risks. For instance, in the electric power sector, strategic decisions to situate some power generation plants near specific mines ensure a steady coal supply but also create site-specific scenarios. In these scenarios, the assets are fixed and expensive to move (Parker, Tan, and Kazan, 2019). While such specialized investments can lead to higher productivity, their value diminishes if the original transaction ends prematurely (Williamson, 1985; De Vita et al., 2011). In such cases, the investor faces the risk of being left with sunk investments, underperforming or excess assets, and an inability to redirect resources to other, more promising ventures (Buvik and Reve, 2001). Thus, when asset specificity is a factor, the transaction costs within a relationship escalate, and the potential for opportunistic behavior increases as well (Dyer, 1996).*

*Many theorists, beginning with those in the field of Transaction Cost Economics (TCE), have long maintained that selecting an appropriate governance structure is crucial for protecting specialized investments and mitigating opportunism (Stump and Heide, 1996; Geyskens et al, 2006). Nevertheless, the imbalance of power between partners affects how each contributes to governance strategies, leading to varied outcomes (Brito and Miguel, 2017). Within this area of study, the work by Subramani and Venkatraman, published in 2003 in the *Academy of Management Journal*, stands out for its significant influence. This prominence is attributed not only to the prestige of the journal and its impact on Supply Chain Management (SCM) research, which is not fully reflected by citation metrics, but also because to the fact that it tackles an issue that remains critically important two decades later. Specifically, it explores how vulnerable suppliers, who typically lack the bargaining power to secure safeguards for their relationship-specific investments upfront (ex-ante), develop governance mechanisms to protect their specialized investments after the fact (ex-post).*

The article by Subramani and Venkatraman, published in 2003, is distinguished not only by its significant findings but also by its methodological rigor, including the clarity in the selection of variables, data collection, and analysis. This detail underscores the study's suitability as a basis for a replication study examining the impact of various asset specificities on relationship governance.

In recent years, the importance of specialized investments in buyer-supplier relationships has surged across numerous industries. This increase is due to dedicated investments, particularly intangible ones, facilitating enhanced efficiency (Hameri and Paatela, 2005), fostering relationship development (Skarmeas and Robson, 2008), and spurring technological progress (Zheng et al., 2022). At the 2023 International Federation of Purchasing and Supply Management World Summit, a key topic of discussion among professionals was the growing necessity for asset specificity to ensure the continuity of strategic and scarce supplies. Over the last decade, there has been a rising demand for specialized routines (adhering to strict delivery protocols), business process redesign (such as customer-specific engineering for unique

¹ University Europea di Roma
e-mail: emanuela.delbufalo@unier.it

component production), and knowledge customization tailored to early involvement practices (Johnsen, 2009; Kähkönen et al., 2015), highlighting the evolving landscape of supply chain management and its increasing complexities.

Purpose of the paper. Recent articles in leading journals have rejuvenated the discussion on the significance of asset specificity in both relationship governance (Blome et al., 2013) and relationship performance (Delbufalo, 2021), thereby indicating that the research field remains vibrant and unexhausted. We decided to contribute to this literature with a replication study. Our contribution is twofold.

Firstly, we aim to demonstrate, through empirical evidence, the connection between asset specificity and governance mechanisms in contemporary business environments. In these settings, intangibles and time constraints are crucial in defining the characteristics of relationships, while power imbalances complicate efforts to mitigate opportunistic behavior.

Secondly, we highlight the importance of replication in the supply chain management literature. We respond to the calls for more replication studies made in various prominent journals and editorials (Gattiker et al., 2021; Pagell, 2021), which argue that replication studies are essential but underrepresented in current research. These studies are crucial because they “provide predictive validity and help to ascertain the generalizability of our theories” (p. 89). Herein, we outline our reasons for replicating the study by Subramani and Venkatraman (2003), detailing our approach. We also discuss the methodological challenges we faced and the anticipated outcomes of our research.

We propose a replication study (Gattiker et al., 2021; Pagell, 2021) that yield two models: Model A and Model B. In Model A, we aim to replicate the original framework devised by Subramani and Venkatraman (2003), employing the same variables, constructs, and operationalizations but testing the hypotheses in a new context to provide either confirmatory or disconfirmatory evidence. This approach will also help us identify new boundary conditions. We plan to use a cross-industry setting to compare our findings with the original study, thereby enhancing their generalizability. Instead of focusing on the retail distribution channels context explored by Subramani and Venkatraman, our analysis shifts to upstream supply chain relationships. Our goal is to understand how smaller suppliers, after making their specialized investments, develop governance mechanisms in their dealings with dominant manufacturers.

In Model B, we introduce an expanded version of the original study that adopts a more thorough approach. This expansion covers three governance mechanisms instead of two and adds an extra dimension of asset specificity, bringing the total to five dimensions rather than four. The broadening of governance mechanisms is designed to expand the range of governance options by considering three distinct constructs (Keller et al., 2021): i) Formal relational governance; ii. Informal relational governance; iii. Informal contractual governance. Furthermore, we expand the range of independent variables to enhance our understanding of the asset specificity construct. We introduce the dimension of temporal specificity, a crucial addition that enables us to consider the intangible investments made to manage time-specific requirements. This dimension highlights the critical role of timing in buyer-supplier relationships and the need for mechanisms to manage the risks associated with investments that have a significant time-bound value. Temporal specificity has become indispensable for companies aiming to navigate the challenges posed by recent disruptions. These events have highlighted the importance of managing time-related uncertainties, as delays and unpredictability in supply chains can severely impact operations and profitability (Holgado and Niess, 2023). Figure 1 summarizes the replication study design and its outcomes.

Methodology. We prepared 59 measurement items which map onto eight constructs provided in Figure 1. We plan to use the “lavaan” package in R programming language (Rosseel, 2012) to build Model A and Model B. The model building follows the standard structural equation modelling approach: Measurement Model, if confirmed, followed by the Structural Model. The measurement model tests whether the items measure the constructs they intend to measure. If the measurement model is confirmed, we continue with the structural model to test the hypothesized relationships. The checks we will perform on the measurement model are as follows.

We will provide a descriptive summary of measurement scales which will include: Factor Loadings; Composite Reliability; Cronbach’s alpha; Average Variance Extracted (AVE). We will consider composite reliability and Cronbach’s alpha to ensure internal reliability of the model. Composite reliability uses the outer loadings of the indicator variables and Cronbach’s alpha is a more conservative measure (Hair et al., 2017a, b). We will check that both measures indicate good internal reliability with values for all the multi-item constructs exceeding 0.7 (Hair et al., 2017a, b; Hulland, 1999). The AVE values need to exceed 0.5 to ensure convergent validity (Hair et al., 2017a,b).

We will check for discriminant validity using the AVE and the Hetero-Trait Mono-Trait (HTMT) ratio. The square-root of the AVE of a construct must be greater than the correlation of that construct with other constructs (Fornell and Larcker, 1981). The HTMT ratios must be lower than 0.90 (Henseler et al., 2015). To check for Common Method Bias, we will follow Harman’s single factor method, where we will include all measurement items in an exploratory factor analysis to check that the first factor accounts for less than 50% of the variance in the unrotated solution (Podsakoff et al., 2003). In the structural model, we will focus on the coefficient of determination (R^2) to measure the model’s predictive power. We will report the effect size (f^2) and predictive relevance (Stone-Geisser’s Q^2 , Geisser, 1975) along with structural model path coefficients and their significance. We will present in a summary table which hypotheses are supported and which are rejected. Our aim is to increase confidence in the validity of the original findings of Subramani and Venkatraman (2003) in Model A and also contribute to knowledge by Model B, which extends the original Model A. We will be able to identify the deviations from expectation (e.g, if we cannot confirm Model A) by checking the differences in the operationalization of the measurement items, population including industry and geographical location of the respondents, and control variables (Gattiker et al., 2022).

Results (expected). Based on a systematic test of competing models, we expect to find that the three dependent variables are indeed different from one another, and their determinants are different as well. It is our aim to state that the three governance dimensions effectively safeguard the relationship-specific investments made by suppliers even if with different intensity. Regarding model A, any deviations from the results of the original study can be explained by considering one or more of the following factors: 1) the different context of analysis (supplier-manufacturer dyadic relationships); 2) the different sampling (multiple networks versus single network); 3) different factors related to the two sectors considered (food and fashion industry). In the original study, a counterintuitive result emerged: site specificity was inversely related to the level of joint decision-making. Subramani and Venkatraman (2003) argue that site specificity ensures by itself continuity in the relationships and no other safeguard are needed. We aim to see if this result is confirmed for formal relational governance (including the former joint decision-making variable) and for the other two dependent variables. Regarding model B, we aim to verify whether some dedicated investments are more influential than others in determining governance choices. In the original study, intellectual capital-specific investments (i.e., domain knowledge specificity) were more decisive than other dimensions of asset specificity in relation to governance choices. Moreover, we expect to see if temporal specificity impacts governance mechanisms and whether this impact is uniform across the three considered dimensions.

Research limitations. The study is still in the experimental phase, and we are proceeding to collect the necessary data to proceed with the replication study (both Model A and B). Therefore, one of the major limitations is related to the fact that it does not yet present empirical test results. Another limitation of the study is related to its nature as a replication study. Indeed, as suggested by Gattiker et al. (2021) and Pagell (2021), working on this type of research implies bearing a higher risk of failure than any other empirical work. Researchers have little incentive to replicate the results of previous studies because reviewers, editors, and readers are biased to the new and the novel (Duvendack et al., 2017). Worse, this novelty bias also provides incentives to engage in questionable research practices (e.g., Bishop, 2019). Finally, on those occasions when replication is done, the results of previous research often are not validated, perhaps because of those questionable practices. Despite those motivations, we strongly believe in the value of such replication exercises for increasing the quality of SCM research. We hope our study contributes to making replication explicitly considered as part of the continual testing and refining of theories, which is central to conducting normal science.

Managerial implications. This analysis holds significant value both theoretically and for managers. From a theoretical standpoint, it offers an opportunity to refine and extend a seminal study by examining its applicability in the context of modern, complex exchanges. By exploring the nuanced impacts of asset specificity, particularly intangible and time-related dimensions, it contributes to a deeper understanding of how governance mechanisms evolve in response to these challenges. For managers, the insights gained are equally critical. Understanding the interplay between asset specificity and governance mechanisms can guide the development of more effective strategies for managing relationships and investments. Specifically, it can help managers identify which types of investments require more tailored governance structures to mitigate risks and enhance value creation. Additionally, by recognizing the importance of intangible assets, managers can better allocate resources towards the protection and leverage of these assets, ensuring their firm's competitive advantage in a rapidly changing business environment.

Originality of the paper. Our objective is to explore how various dimensions of asset specificity influence specific governance dimensions, and to identify which relationships are most intense compared to others. We aim not only to compare our findings with those of the Subramani and Venkatraman's (2003) study but also to update the discussion on the relationships between dependent and independent variables. Our primary interest lies in determining whether intangible specific investments exert a stronger influence on certain types of governance (e.g., joint decision-making or relational norms) as opposed to tangible investments (such as physical and site specificity). Additionally, we seek to understand which dedicated investments necessitate more extensive and diversified safeguards. Through this analysis, we aim to reassess the validity of Transaction Cost Economics in the context of modern exchanges, which are characterized by a fragmentation of governance mechanisms and a shift towards the intangible (and time-related) dimensions in relation to asset specificity.

Decarbonizing Last-Mile Delivery: a study on crowdsourced delivery incentives

SILVIA BLASI¹ SARA TONIOLO²

Abstract

The increasing trend of online purchases has imposed considerable tension on delivery services, particularly in the realm of last-mile delivery. This trend has contributed to a notable increase in the number of delivery vehicles, resulting in enhanced CO2 emissions and intricate traffic logistics in urban areas. Consequently, the imperative for the effective integration of sustainable green delivery systems, such as crowdsourced delivery, is on the rise. This research delves into the interplay between economic compensation, non-economic benefits, and the inclination to engage in crowdsourced delivery. Employing an online survey involving 137 participants, the results reveal that both economic compensation and non-economic benefits correlates with an increased willingness to participate in crowdsourced delivery. Intriguingly, the moderating factors of extra travel time and exploration stage challenges do not significantly impact this relationship. This research contributes valuable insights to strategic management, urging delivery firms and their managers to adopt and promote the implementation of environmentally friendly delivery systems.

Key words: Last-mile delivery, crowdsourced delivery, decarbonization

Framing of the research. *The growth of e-commerce has revolutionized the way we shop, transforming the retail landscape and significantly impacting the last-mile delivery sector. The World Economic Forum's (WEF) estimation of 19 million metric tonnes of CO2 emissions from delivery vehicles in major cities in 2019 underscores the environmental fee of this evolving trend. By 2030, 36% more delivery vehicles are anticipated to be on the road (Hartlief & De Leth, 2021), this projection intensifies concerns about the sustainability of current last-mile delivery practices.*

In today's digital age, the seamless process of ordering a package with a few clicks on a computer has become commonplace. With 51% of retailers already offering same-day delivery and 65% intending to adopt this service within the next two years (Saleh, 2018), the demand for efficient last-mile delivery solutions is more pressing than ever. However, the convenience of doorstep delivery comes at a significant cost, both economically and environmentally. Last-mile delivery, a critical component of business-to-consumer e-commerce, poses challenges for retailers striving to balance speed and quality in product delivery (Devari et al., 2017). The common choice offered to customers between store pickup and home delivery reveals the ongoing struggle to find cost-effective and sustainable solutions. Despite the majority of online shoppers preferring home delivery, the costs associated with last-mile delivery range from 13% to 75% of total supply chain expenses, a substantial financial burden for retailers (Gevaers et al., 2009). Compounding these challenges are issues such as the "not-at-home syndrome" and the "ping-pong" effect, where customers' unavailability or failure to meet agreed-upon delivery times results in added financial and environmental costs due to additional miles driven, especially in areas with low consumer density (Devari et al., 2017).

In response to these challenges, retailers are exploring diverse delivery methods, from traditional carriers like DHL to innovative concepts like drone deliveries and in-store pickups with drive-through windows (Slabinac, 2015). However, one of the most intriguing solutions that has emerged in recent times is crowd logistics, offering a potential remedy to last-mile delivery issues in urban areas (Castillo et al., 2022). With the daily surge in deliveries and a growing emphasis on sustainability, academics and industry managers are recognizing the need to explore crowdsourced last-mile delivery as a viable and eco-friendly option.

Purpose of the paper. *In the contemporary academic landscape, scholars have extensively delved into the realm of crowdsourced logistics, crafting frameworks, designing models, and scrutinizing the efficiency of these logistical systems. However, a notable research gap exists, presenting an intriguing avenue for further exploration in this study. Specifically, this research aims to investigate the impact of various payment and incentive schemes on individuals engaged in crowdsourced delivery, as highlighted by prior work (Arslan et al., 2019). The intricate examination of the proposal to provide store credits or rewards to those contributing to delivery assistance, as suggested by Devari et al. (2017), demands thorough investigation. This research posits that a deeper comprehension of the motivations and behaviors of*

² University of Verona
e-mail: sara.toniolo@univr.it

crowdsourced drivers, as advocated by Castillo et al. (2018), has the potential to facilitate the development of intricate and potentially more effective supply management strategies. More in detail, this study aims to fill a critical research gap by exploring the motivations of individuals participating in crowdsourced delivery and identifying the incentives that resonate with them. Acknowledging the pivotal roles played by economic compensation and non-economic benefits in driving participation, the research also probes into the impact of factors such as additional travel time and challenges encountered during the exploration stage. Through the application of a quantitative analysis of primary data gathered through surveys, the study aspires not only to enhance the theoretical understanding of sustainable last-mile delivery systems but also to provide practical insights for the formulation of effective supply management strategies. This paper, in particular, aims to address the following research questions:

RQ: Do economic compensation & non-economic benefits lead to more people joining the crowdsourced delivery system? Do extra travel time and exploration stage challenges have an influence on this?

Participation in crowdsourced delivery is incentivized from the crowdsourcer's perspective, encompassing both monetary and non-monetary rewards (Mladenow et al., 2014; 2015; 2016). The remuneration associated with shipments significantly influences couriers' decisions to bid for shipping requests (Ermagun et al., 2020). External motivators, such as financial gain, fame, and prizes, play a crucial role when individuals are driven by factors unrelated to the intrinsic appeal of the activity itself (Hossain, 2012). Additionally, various initiatives underscore non-economic factors, addressing diverse motivations for engaging in crowdsourced delivery. Some emphasize social ties, promoting activities like "shopping with friends," while others highlight environmental benefits, positioning their service as "environmentally friendly delivery." Political declarations and altruistic experiences are also leveraged, as seen in mission statements like "empowering local economies in a connected world" or offers of altruistic joy such as "making someone happy when you travel" (Carbone et al., 2017).

However, participating as a driver in a crowdsourced delivery system often incurs an additional time cost compared to non-participation. Drivers must make a trade-off when deciding whether to accept a delivery request, with travel distance to the task being a critical factor influencing this decision. Quantitative modelling reveals that the distance to the task significantly impacts workers' willingness to undertake it, with a diminishing effect on utility as travel distance increases (Miller et al., 2017; Kim, 2015). This highlights the importance of understanding the dynamics of travel time and distance in shaping couriers' decisions within the context of crowdsourced delivery.

Despite the potential compensation, several factors can act as deterrents to individuals considering participation in crowdsourced logistics. These include the perceived risks of incurring extra costs, the absence of relevant laws, unclear distribution of responsibilities, financial instability, and a lack of social protection. These challenges, collectively referred to as "exploration stage challenges," stem from the underdevelopment of crowdsourced delivery and can impede the willingness of individuals to participate (Huang et al., 2020).

Building upon the insights from existing literature, this research posits the following hypotheses:

H1: The willingness to engage in crowdsourced delivery exhibits a direct positive correlation with both economic compensation and non-economic benefits.

H2: The association between economic compensation, non-economic benefits, and the willingness to participate in crowdsourced delivery is moderated by extra travel time. Consequently, the strength of this relationship diminishes when there is an increase in extra travel time.

H3: The association between economic compensation, non-economic benefits, and the willingness to participate in crowdsourced delivery is moderated by exploration stage challenges. As a result, the strength of this relationship diminishes when there is an increase in the level of exploration stage challenges.

Figure 1: Conceptual model

Methodology. This study follows a quantitative cross-sectional research design. We developed, using the online tool Qualtrics, a questionnaire-based survey to collect data. The language used in the questionnaire was English. To ensure that the respondents to the questionnaire would correctly understand the questions, the survey was pre-tested and validated by research group members. In terms of the sampling approach, a combination of snowball sampling and convenience sampling was employed. The survey was initially distributed within the personal network of the researcher through email. By encouraging participants to share the survey in their own networks (snowball sampling), a more diverse and expansive sample group was achieved. The survey was also shared on social media platforms such as LinkedIn and Instagram to further broaden the reach. The population of interest in this study comprises adults aged 18 or older, reflecting the minimum age required due to the responsibilities associated with participating in crowdsourced delivery. The results were analysed through IBM SPSS. All the items used to operationalize the constructs were based on validated scales in the extant literature. Each construct was measured through multi-item scales that ranged from 1- strongly disagree to 7- strongly agree.

The sample was equally distributed between males and females (49.6% males and 50.4% females). Regarding age, more than half of the participants were under 25 years old (54.7%). Furthermore, most of the participants had a master's degree (62.8%) or a bachelor's degree (33.6%). Finally, most of the participants are students and worked part-time (46.0%).

Results. Cronbach's alpha was computed for each variable to assess the reliability of the scales in this study. The economic motivation and non-economic benefits items exhibited a Cronbach's alpha of .684, slightly below the desired .7 threshold. Despite attempts to improve by removing items, no increase in Cronbach's alpha was observed, and there were no items with a distinctly low item-total correlation. Therefore, the reliability is deemed sufficient to proceed. For the extra travel time variable the Cronbach's alpha is .773. In contrast, the variable exploration stage challenges showed a Cronbach's alpha of .529, raising concerns about its reliability. Despite moderate inter-item correlations, removing items did not enhance Cronbach's alpha beyond .589. While acknowledging this limitation, the study proceeded with this scale for testing the model, emphasizing the need for cautious interpretation of the result. The Cronbach's alpha for willingness to participate in crowdsourced delivery stands at .585. Given its two-item composition, the option of item deletion is not viable. The correlation matrix serves to reveal the strength of relationships between variables. In the matrix, it is observed that extra travel time exhibits a weak positive correlation with economic compensation and non-economic benefits ($r = .027$; $p < .05$; $N = 137$). Additionally, willingness to participate in crowdsourced delivery shows a moderate positive correlation with economic compensation and non-economic benefits ($r = .545$; $p < .01$; $N = 137$). Notably, none of the variables in the model demonstrate a high correlation with one another. The Cronbach's alpha values for each variable are provided in parentheses.

Table 1: Means, Standard deviations, Correlations, and Cronbach's alpha

Variable	M	SD	1	2	3	4
1. Compensation and benefits ¹	4.87	1.09	(.684)			
2. Extra travel time	3.66	1.37	.207*	(.773)		
3. Exploration stage challenges	5.30	0.85	.087	-.001	(.529)	
4. Willingness to participate	4.34	1.43	.545**	.265**	-.061	(.585)

N = 137

¹ = Economic compensation & non-economic benefits

² = Willingness to participate in crowdsourced delivery

*. Correlation is significant at the 0.05 level (2-tailed).

**. Correlation is significant at the 0.01 level (2-tailed).

Note: Cronbach's alpha is in parentheses on the main diagonal.

The regression analysis indicates a positive and significant association between economic compensation and non-economic benefits with the willingness to participate in crowdsourced delivery, supporting H1. This implies that both economic compensation and non-economic benefits are positively correlated with the willingness to engage in crowdsourced delivery.

In further exploration, we investigated whether additional factors, namely extra travel time and exploration stage challenges, could impact the identified relationship. However, the results indicate that the connection between economic compensation & non-economic benefits and the willingness to participate in crowdsourced delivery remains unaffected by extra travel time and exploration stage challenges. Consequently, H2 and H3 are not supported. A summary of the hypothesis testing outcomes is detailed in Table 2.

Table 2: Results of the tested hypotheses

H1	The willingness to engage in crowdsourced delivery exhibits a direct positive correlation with both economic compensation and non-economic benefits.	Accepted
H2	The association between economic compensation, non-economic benefits, and the willingness to participate in crowdsourced delivery is moderated by extra travel time. Consequently, the strength of this relationship diminishes when there is an increase in extra travel time.	Rejected
H3	The association between economic compensation, non-economic benefits, and the willingness to participate in crowdsourced delivery is moderated by exploration stage challenges. As a result, the strength of this relationship diminishes when there is an increase in the level of exploration stage challenges.	Rejected

Research limitations and future research. While this study has made valuable contributions to both theory and management, it is not without its limitations. However, these limitations can serve as catalysts for future research. One notable limitation is the overrepresentation of young adults in the sample group, consequently, the sample is less representative of the general population, reducing the study's generalizability. Additionally, 70.1% of the sample group did not possess a motor vehicle, which could potentially influence their responses to the survey on crowdsourced delivery.

Future studies should strive for a more balanced sample that includes individuals of various ages and income levels, while also considering the possession of a motor vehicle. This approach will enhance the study's external validity and provide a more comprehensive understanding of the factors influencing willingness to participate in crowdsourced delivery across diverse demographic groups.

The results of this study are based on quantitative research future research could delve deeper into obtaining concrete data about desired economic compensation & non-economic benefits by combining quantitative and qualitative methods. This approach allows for broad-reaching results and a deeper understanding. Given the contradictions between this study's results and previous research on the impact of extra travel time and exploration stage challenges, future studies should explore whether these factors influence other sample groups. Identifying additional factors influencing the relationship between economic compensation & non-economic benefits and willingness to participate in crowdsourced delivery is essential for creating efficient systems.

Managerial implications. The escalating volume of home-delivered parcels places considerable strain on delivery services, necessitating more efficient and environmentally friendly last-mile delivery solutions. Crowdsourced delivery presents an opportunity for industry managers to implement a novel strategy. However, the success of crowdsourced delivery hinges on the active participation of non-professional delivery drivers. The findings of this research underscore the pivotal role of economic compensation & non-economic benefits in convincing individuals to engage in crowdsourced delivery. Now armed with the knowledge that a positive relationship exists; delivery service managers need to take strategic steps to offer suitable economic compensation & non-economic benefits. The initial step involves managers understanding the specific compensation expectations of potential participants, which may vary across industries, countries, and even regions within a country due to distinct circumstances such as population density, infrastructure, and public transport availability. This information enables the provision of competitive compensation that attracts and retains participants. To maintain participant motivation and satisfaction, managers should regularly review and adjust compensation based on factors like demand, distance, and time. Establishing a clear and transparent payment structure is equally crucial. Participants should have a comprehensive understanding of how their rewards are calculated and when they can expect to receive them. Transparent processes and clear guidelines foster trust and fairness, encouraging more people to join. Moreover, effective communication channels must be established. Managers should maintain regular communication with participants in the crowdsourced delivery system, keeping them informed about changes, updates, and other opportunities within the system. Clear and timely communication builds trust and keeps participants engaged in the process.

Lastly, implementing a monitoring and evaluation program is crucial. Managers should continuously assess the effectiveness of their compensation and benefits strategies by tracking participant satisfaction, performance metrics, and retention rates. Regular monitoring enables managers to identify areas for improvement and make necessary adjustments, optimizing the success of the program through ongoing evaluation. It's noteworthy that this study's results indicate that extra travel time and exploration stage challenges do not have an impact on the positive relationship between economic compensation & non-economic benefits and the willingness to participate in crowdsourced delivery. While this research did not delve into the specific factors influencing this relationship, it highlights the potential for future research to explore and understand these factors, facilitating adaptability and responsiveness in this evolving field.

Originality of the paper. In the contemporary landscape, the last-mile delivery segment presents a formidable challenge for business-to-consumer e-commerce. With the surge in online purchases, retailers face mounting pressure to execute rapid and high-quality deliveries to meet customer demands (Devari et al., 2017). However, the growing fleet of

delivery vehicles required for these services contributes to millions of tonnes of CO₂ emissions, a concerning trend that shows no signs of abating (Hartlief & De Leth, 2021). In response to these environmental concerns, the significance of green delivery systems, such as crowdsourced delivery, is on the rise. This research aimed to ascertain whether a positive relationship exists between economic compensation & non-economic benefits and the willingness to participate in crowdsourced delivery. Additionally, the study explored the potential moderating effects of extra travel time and exploration stage challenges on the relationship.

Based on the results of a cross-sectional quantitative study on economic compensation & non-economic benefits, and the willingness to participate in crowdsourced delivery, it can be concluded that, in this research, a significant positive relationship exists. Nevertheless, in this research, extra travel time and exploration stage challenges do not influence this positive relationship. This research added to the body of knowledge on the above-mentioned relationship and supported those studies that found this relationship. The results show that there are opportunities for delivery services and their managers to respond to these confirmed facts, allowing them to implement this green delivery method effectively. First of all, this leads to a lower number of freight delivery vehicles in (sub)urban areas, thereby benefiting society. Next, it supports firms saving money on delivery, while still providing the same level of service. This innovative design also allows for social collaboration, allowing non-professionals to participate in last-mile delivery strategies and contribute to a community effort that could result in a more sustainable neighborhood (Pourrahmani & Jaller, 2021). By offering the right amount of economic compensation & the desired non economic benefits, the number of people participating in crowdsourced delivery will increase, resulting in a more economical and environmentally friendly system that ultimately raises everyone's quality of life.

Managing critical raw materials in energy transitioning supply chains: a Resource Dependence theoretical perspective on supply chain management capabilities

VITTORIO MARIA GARIBBO¹ FRANCESCO GHEZZI² ELEONORA ANNUNZIATA³
FRANCESCO RIZZI⁴ - MARCO FREY⁵

Abstract

Critical Raw Materials (CRMs) are of pivotal importance for the green energy transition, and their demand is generally forecasted to hugely increase over the next decades. Sourcing of CRMs is a pressing issue which is going to highly influence supply chain (SC) management strategies of involved firms in the next years, as the security of this supply is threatened by several geopolitical and business factors. In this scenario, we decided to study which are the SC managerial capabilities and the associated actionable levers and strategic responses that SC managers should adopt to deal with the supply of CRMs. Leveraging on the Resource Dependence Theory (RDT), we envisioned a three-levels theoretical framework by linking SC managerial capabilities with levers and strategies from the RDT. We built several configurations, called scenarios, and adopted an experimental design which implements a vignette-based rank-ordered logit model to assess which are the capabilities whose variation has a greater influence on the SC control over CRMs supply. Our research is based on a survey administered to Italian SC managers which deal with CRMs in their operations. Results will benefit from revealed and unrevealed preferences of SC managers. The former identify the most suitable SC management capabilities in the CRM supply context, while the latter provide the strategic responses and actionable levers most suited to respond to the phenomenon of interest.

Key words: *critical raw materials; resource dependence theory; energy transition; supply chain; capabilities; vignette-base method*

Framing of the research. *The issue of Natural Resource Scarcity (NRS) is increasingly concerning globally, impacting businesses across various levels. NRS can manifest locally or globally, affecting both non-renewable resources like coal, oil, and minerals, as well as renewable ones such as water, wood, and agricultural products (Bell et al., 2012). Within this framework, the transition towards clean energy is instigating a significant revolution, redirecting resource requirements from traditional internal combustion engines powered by coal, gas, and oil to critical raw materials (CRMs) like lithium, nickel, and cobalt, pivotal in clean energy technologies. Forecasts indicate that the demand for CRMs is projected to quadruple by 2040 to support the clean energy transition technologies (IEA, 2021). However, this trajectory poses the risk of slowdowns due to challenges in CRMs supply unless specific issues are addressed: diversifying supply chains to mitigate reliance on a single source, unlocking technological potential, and ensuring sustainability and responsible sourcing (IEA, 2021). As a matter of fact, in recent years, there has been a significant surge in research focusing on Supply Chain (SC) security, with scholars becoming increasingly concerned about various CRMs supply issues (Liu et al., 2024). Of particular concern is the security of CRMs supply, especially with the advancement of new green energy technologies. This concern stems from the potential impact of geopolitics, trade barriers, and unilateral actions on critical mineral supply chains worldwide. In this context, the development of new tools for SC managers which could lead to the minimization of natural resource consumption, waste, and pollution in SC management “appears to be a strategic priority for improving both competitiveness and environmental performance” (Kabongo and Boiral, 2017). Moreover, the uncertainty that arises in supplying CRMs also requires the ability to adapt quickly and effectively to changes in customer and competitive demands (Yusuf et al., 2014). To the best of our knowledge, there’s only the above-*

cited study from Kabongo and Boiral (2017) which tries to link organizational capabilities and eco-efficiency, arguing that organizational capabilities represent a valuable contribution in improving organizations' resource optimization and competitive advantage.

Therefore, we decided to develop the understanding of the managerial capabilities, strategic responses, and actionable levers that SC managers may adopt to deal with the supply of CRMs. In doing so, we leverage on the Resource Dependence Theory (RDT) as theoretical framing of the research. RDT posits that organizations live in networks of interdependent actors from a resource point of view, and leverage on their power relations to achieve control over scarce resources (Pfeffer & Salancik, 1978). Organizations rely on resources sourced from a multitude of entities, each with its own distinct perspectives and interests, which influence the strategic choices of the firm (Oliver, 1991). This theoretical perspective is particularly useful in our setting, as CRMs supply was born and develops ever more in a context of heightened complexity and interconnectedness of global supply chains (Liu et al., 2024).

We carried out a profound review of the SC management literature to define the **SC management capabilities** that could be used in our conceptual model. According to a review of strategic capabilities in SC (Vishnu et al., 2019), the SC management capabilities in **Table 1** were taken into consideration.

Table 1: SC management capabilities

Capability	Description	References
Flexibility	The ability to cop up with predictable fluctuations in terms of time, volume, mix, price, product, etc. It describes the ability of the supply chain to change or react to environmental uncertainty, to meet the increasing variety of customer expectations without excessive costs, time, organizational disruptions, or performance losses	Vickery et al., 1999; Wang et al., 2016; Manders et al., 2017; Seebacher and Winkler, 2015
Resilience	It enables organizations to react and recover from disturbances and safeguard the substantial stability of their processes within acceptable times and costs	Ribeiro and Barbosa-Povoa, 2018; Chen et al., 2017; Azevedo et al., 2008
Agility	It refers to the reaction time of companies to changes in market conditions and specifically to the speed of response to perturbations	Manders et al., 2017; Christopher, 2000; Lee, 2004
Sustainability	It indicates the management of the supply chain and the collaboration among firms to pursue the goals of the three dimensions of sustainable development: economic, environmental, and social	Seuring and Muller, 2008; Sarkis et al., 2011; Choudary and Sangwan, 2021
Reliability	The ability of the system to substantially maintain its operations in case certain disturbances occur. It reduces the probability of serious alterations to the production system, the related consequences, and the time to return to its expected productivity	Chen et al., 2017; Snyder, 2003; Miao et al., 2009
Efficiency	The ability to economically exploit the potential of the supply chain by reducing procurement costs, lead times, packaging, transportation and inventory costs, and the time devoted to contract management	Kristal et al., 2010; Beamon, 1999

To identify the **actionable levers** and the **strategic responses** to achieve stability and control over CRMs supply, we leveraged on the RDT (Pfeffer & Salancik, 1978; Caniels & Gelderman, 2007; Kalaitzi et al., 2018). The levers that the RDT foresees are the followings:

- **Importance of the Resource (IR):** It encompasses the actions a company can take to reduce the impact from price fluctuations and ensure a continuous flow of material, especially in times of shortage. These actions become increasingly critical in situations of high price volatility and reduction in market supply.
- **Supplier Substitutability (SS):** It refers to the actions aimed at increasing the sources of supply to reconfigure, as necessary, the supply chain to enable rapid and cost-effective supplier switching. The rationale of the above actions depends on the fact that in general the fewer the number of suppliers used the higher is their replacement cost.
- **Discretion over the Resource (DR):** Incorporates mimetic and adaptive actions that a company undertakes to enhance its control over scarce resources. It becomes crucial when resources face socio-political and institutional pressures, and geopolitical and legislative conditions may jeopardize resource procurement.

The two generic forms of strategic response to supply dependency issues envisioned by the RDT are buffering and bridging strategies. **Buffering strategies** involve implementing measures to manage uncertainty by establishing safeguards that shield the enterprise from the risks associated with procurement. Buffering strategies operate externally to the existing supply relationships of the enterprise, intending to reduce exposure to suppliers and mitigate potential negative consequences from disruptions. The enterprise builds slack resources to absorb shocks, such as increased inventory, flexible production processes, a surplus of suppliers, and a supply chain design that avoids dependency on individual entities. On the other hand, **bridging strategies** encompass actions to manage uncertainty through the expansion and strengthening of existing supply relationships. Bridging strategies operate internally within the enterprise's supply relationships, aiming to manage dependence on scarce resources by exerting greater influence over them. Enterprises employing bridging strategies can modify or manipulate their exchange relationships through formal or informal actions. This ranges from building trust with partner firms, investing in collaborative structures, and enhancing information exchange to vertical integration.

Figure 1 illustrates the three theoretical levels examined in this study within the realm of Supply Chain Management in CRMs contexts.

Figure 1: Theoretical framework

Purpose of the paper. This study aims to explore which are the capabilities whose variation has a greater influence on the SC control over CRMs supply. Thus, by analysing the preferred capabilities of a pool of supply chain managers, we could derive the most coherent action levers and their corresponding strategic directions.

The paper poses the following objectives:

- Identify strategic responses to establish a resilient business framework capable of addressing the exogenous pressures impacting procurement processes promptly;
- Uncover actionable levers for managing procurement issues, price volatility, and developing a supply chain aligned with ESG requirements;
- Define managerial capabilities necessary for leveraging these strategies and implementing appropriate responses.

Finally, we want to investigate if these results are dependent on some characteristics of the respondents, such as industry, years of experience, countries being sourced from, and CRMs treated.

Methodology. Our research is based on a primary data collection conveyed through a survey instrument, which was delivered to a sample of Italian SC managers operating in different industries and that sources CRMs from all over the world. By focusing on the SCM we will obtain a structural homogeneity that will improve the processes of statistical inference. The paper adopts a mixed methodology, mainly based on an experimental design which implements a vignette-based rank-ordered logit model (Rologit). At the same time, it beneficiaries from a complex structure where the three levels of analysis, managerial capabilities, actionable levers, and strategic responses are integrated to provide more insights through a combination of revealed and unrevealed preferences expressed by the sampled respondents.

The survey instrument used for the study couples the vignettes with a set of close-ended questions to match the preferences expressed by the respondents through the vignettes with a propensity score that may reveal which respondents' characteristics influence their preferences. Vignettes convey greater realism to the respondent compared to direct-question-based methods, as they provide situational factors that are close to an operative decision-making process (Hyman & Steiner, 1996). As our respondents are expert SC managers or buyers, posing in front of them such questions put them in a situation which is closer to their everyday activities and might result in a less-biased outcome with respect to a classical direct-question method. In order to build the vignettes, we followed the methodological steps proposed by Contini et al. (2020). This is a four-step process composed by: 1) identification of the attributes; 2) definition of the modalities of variation of the attributes; 3) construction of the scenarios; 4) measurement of the preferences from the respondents.

- 1) The attributes were identified in the six SC management capabilities described above.
- 2) The modalities of variation represent the attributes' extremes "which, according to a broad spectrum of possible degrees, could lead to polar levels of importance consumers give to each attribute" (Contini et al. 2020, p. 5). To establish them, we referred to the literature cited in defining the attributes, leading finally to a measurable proxy of the attribute that serves two goals: it is easily understandable by the respondents and it better suits the design of the survey instrument, rather than the entire definitions provided in **Table 1**. The list of attributes and their modality of variations are provided in **Table 2**.
- 3) The scenarios are textual combinations of the attributes where each of them assumes a particular weight. Given weights must be in trade-off among the different attributes in a single scenario, and among different scenarios an equilibrium should be achieved to make the choice actually challenging and thus significative. Our scenario-building was informed by the RDT's strategies and levers, by drafting each scenario in compliance with a strategy-lever matching. Thus, we built **6 different scenarios** where each one presents the combination of the 6 capabilities identified more coherent with the strategy-lever match. Scenarios are provided in **Table 3**.
- 4) Preferences were measured by asking the respondents to **order the scenarios** and to indicate the best configuration for managing supply chain criticalities when dealing with critical raw materials. Thus, they will order scenarios from the preferred one to the less preferable.

Table 2: Attributes, modalities of variation and associated weights

Attribute	Modalities of variation	Weight
<i>Flexibility</i>	Adaptation speed to changes is high	3
	Adaptation speed to changes is medium	2
	Adaptation speed to changes is low	1
<i>Resilience</i>	Material stock and suppliers back up is high	3
	Material stock and suppliers back up is medium	2
	Material stock and suppliers back up is low	1
<i>Agility</i>	Information exchange speed is high	3
	Information exchange speed is medium	2
	Information exchange speed is low	1
<i>Sustainability</i>	Ability to manage collaborations for environmental efficiency and waste reduction is high	3
	Ability to manage collaborations for environmental efficiency and waste reduction is medium	2
	Ability to manage collaborations for environmental efficiency and waste reduction is low	1
<i>Reliability</i>	Speed in reacting to supply chain shocks is high	3
	Speed in reacting to supply chain shocks is medium	2
	Speed in reacting to supply chain shocks is low	1
<i>Efficiency</i>	Ability to manage supplying and distribution costs is high	3
	Ability to manage supplying and distribution costs is medium	2
	Ability to manage supplying and distribution costs is low	1

The survey was organized into three sections: 1) an introductory section where, after the explanation of the aims of the study, respondents were asked to answer profiling questions regarding their job position, their company's size, revenues and industry, the CRMs they deal with in their operations and the countries they source from; 2) the vignette section and their ranking; 3) three final questions covering initiatives to develop the three levers (IR, SS, DR).

Table 3: scenarios constructed in the vignette-based method

Scenario	Attributes and relative weights in each scenario
<i>A</i>	Adaptation speed to changes is high (3) Material stock and suppliers back up is high (3) Information exchange speed is low (1) Ability to manage collaborations for environmental efficiency and waste reduction is low (1) Speed in reacting to supply chain shocks is medium (2) Ability to manage supplying and distribution costs is low (1)
<i>B</i>	Adaptation speed to changes is high (3) Material stock and suppliers back up is medium (2) Information exchange speed is low (1) Ability to manage collaborations for environmental efficiency and waste reduction is medium (2) Speed in reacting to supply chain shocks is low (1) Ability to manage supplying and distribution costs is low (1)
<i>C</i>	Adaptation speed to changes is low (1) Material stock and suppliers back up is medium (2) Information exchange speed is high (3) Ability to manage collaborations for environmental efficiency and waste reduction is medium (2) Speed in reacting to supply chain shocks is medium (2) Ability to manage supplying and distribution costs is low (1)
<i>D</i>	Adaptation speed to changes is medium (2) Material stock and suppliers back up is low (1) Information exchange speed is medium (2) Ability to manage collaborations for environmental efficiency and waste reduction is high (3) Speed in reacting to supply chain shocks is low (1) Ability to manage supplying and distribution costs is low (1)
<i>E</i>	Adaptation speed to changes is low (1) Material stock and suppliers back up is medium (2) Information exchange speed is low (1) Ability to manage collaborations for environmental efficiency and waste reduction is low (1) Speed in reacting to supply chain shocks is high (3) Ability to manage supplying and distribution costs is medium (2)
<i>F</i>	Adaptation speed to changes is medium (2) Material stock and suppliers back up is low (1) Information exchange speed is low (1) Ability to manage collaborations for environmental efficiency and waste reduction is medium (2) Speed in reacting to supply chain shocks is medium (2) Ability to manage supplying and distribution costs is high (3)

As this paper is an ongoing project, data analysis is still to be performed upon the conclusion of the data collection phase. However, a rank-ordered logistic regression model will be performed to test which capabilities have a greater effect on SC control over CRMs supply. Unlike simply identifying the preferred alternative, the model provides the expression of the individual's preferences in terms of willingness to leverage each capability to overcome supply chain management criticalities.

In our study, we utilized individual rankings as the dependent variable to express preferences in terms of capabilities to manage CRMs supply. The logit model is constructed based on a random utility model, where respondents rank multiple alternatives or vignettes (Contini et al., 2020), with m representing the number of alternatives (in our case, $m=6$). Each ranked alternative or vignette serves as an observation.

The utility obtained from each alternative ($j = 1, \dots, m$) is determined by:

$$U_j = b_{0,j} + b_{1,j} X_1 + \dots + b_{k,j} X_k + \epsilon_k$$

X_1 through X_k denote the explanatory variables, representing the variations in attributes. The coefficients $b_{0,j}, b_{1,j}, \dots, b_{k,j}$ express the significance and the weight of each capability to maximize the "utility" of our SC managers sample, while ϵ represents the error terms.

Results. As this is an ongoing project, where the data collection phase is still ongoing, results are yet to come. However, expected results of the data analysis foresee to benefit both from revealed and unrevealed preferences of the sample of SC managers. Particularly, revealed preferences are intended to identify the most suitable SC management capabilities in the CRM supply context, i.e. the capabilities whose variation in the scenarios presented affects the outcome (SC control over CRMs supply) the most. At the same time, given that we constructed the scenarios based on the RDT's construct of strategic responses and actionable levers, the scenarios' ranking will provide us also with unrevealed preferences regarding which strategic responses and actionable levers are most suited to respond to the phenomenon of interest. Finally, the results of the propensity score matching are envisioned to show if the above results are sensitive to the variation of the respondents' characteristics. In particular, we expect to obtain different revealed and unrevealed preferences of SC managers depending on their company's industry, size, CRMs treated, and countries sourced from, given that these attributes have the potential to greatly influence the SC landscape and therefore the preferred ways to accomplish the CRMs supply issues.

Research limitations. This research has some limitations which must be acknowledged. The first concerns the ranking process of the vignette method which is not an easy task to be accomplished given the number of scenarios involved (6) and the different attributes in each of them (6 as well) to be taken into account simultaneously. Even if we selected a very specific and expert audience of SC managers, we cannot be sure that they rigorously evaluated all the options, and we must take into account the risk of some random answers. Secondly, our choice of the management capabilities had to be limited to a restricted number to ensure the proper functionality of the questionnaire. This could have left out some other important capabilities, given that the entire list of SC management capabilities discussed in literature is potentially endless. However, we selected the most implemented and listed in the literature by trying to choose at the same time capabilities distant one from the other, in order to diminish the ambiguities that managers could face in confronting them. Thirdly, the construction of scenarios, even if based on a matching with RDT's strategies and levers, could have been influenced by the biased judgement of the authors related to what scenarios appeared as best to be included in the study. Lastly, the study has been conducted with a sample of Italian SC managers. Future studies should address a larger and geographically wider sample of respondents to improve the generalizability of the conclusions.

Managerial implications. This paper provides managers with important and fruitful implications to tackle a complex and challenging supply such as the supply of CRMs. As a matter of fact, the insights regarding capabilities could be directly transferred into training activities to be focused on the capabilities that this study will reveal as most important to control CRMs supply. Moreover, practical actions to leverage upon the strategies and the actionable levers from the RDT that our study has revealed as most appropriate in the context of CRMs supply should be implemented by SC managers. We believe that our paper could enable and strengthen a national dialogue on CRMs and the management of their supply chains, aiming to foster a reasonable awareness of the situation and prompt economic and government operators to consider the risks associated with the supply of such materials, along with the related geopolitical risks and the possibility of not meeting the timelines of the net-zero transition, with all its potential consequences.

Originality of the paper. Our paper is highly original in most of its components. The contextual framing on CRMs is lacking management literature that explores its characteristics, particularly in relation with SC issues (Liu et al., 2024). The theoretical background adopted borrows strategies and levers from the RDT and capabilities from the various literature on SC risk management: we thus believe our study to represent a "substantive use" of the RDT in the field of SC management, responding to the call of Wry et al. (2013) to substantially engage with RDT's concepts. Finally, the adopted methodology based on the vignette method, is less commonly used in management studies but proves insightful for understanding respondents' preferences. Vignettes are designed to present a series of situational or contextual factors and prompt respondents to evaluate alternative scenarios (Hyman & Steiner, 1996, p.1). By assessing and ranking scenarios, respondents provide information on the relative importance assigned to each attribute comprising the scenarios themselves (Wason et al., 2002). Based on our model construction, this methodology offers a dual innovative contribution. From a more linear perspective, it identifies the capabilities evaluated as preferable by supply chain

managers. However, we also obtain undisclosed information inherent in the designed framework, enabling the identification of strategic levels most aligned with the chosen capabilities. This result can be valuable for understanding whether companies are investing in developing competencies in line with their strategic settings or exploring alternatives, suggesting a strategic direction that maximizes the preferred competency structure.

Track 13
Sustainability

The rebound effect of responsible consumption: an explorative research on sharing economy consumers

VERONICA CAPONE¹ CECILIA GRIECO²

Abstract

It is commonly believed that the sharing economy (SE), the economic system based on the sharing of goods and services, promotes sustainable consumption. However, the spread of this practice and digital technologies, have opened a debate on the possible negative effects of the SE, questioning its role as a facilitator of sustainability. According to many authors, the cost savings and convenience of this new sharing practice generates the so-called “rebound effect”, i.e. an increased demand for products and services. Given the scarcity of studies about this within the domain of the SE, the present research aims to shed light on the rebound effects that are associable with the SE, focusing on the household level. A qualitative empirical analysis will be performed through the focus group methodology, involving active users of SE from different industries (e.g., food, goods, mobility). The goal is to understand what are the typologies of rebound effects that could be associated with the use of SE services and provide a framework to classify and measure them.

Key words: *sharing economy; collaborative consumption; rebound effect; moral licensing theory; qualitative research.*

Framing of the research. *Globalization and rapid technological developments have contributed to the emergence of a new economic system - the sharing economy (SE) (Araújo, 2021). Since the turn of the millennium, SE has become increasingly relevant (Belezas & Daniel, 2023). Defining the concept of a SE is complicated as SE practices are varied and constantly evolving (Hossain, 2020). Munoz and Cohen (2017, p 21) define SE as “a socioeconomic system that enables an intermediate set of exchanges of goods and services between individuals and organisations that aim to increase the efficiency and optimisation of underutilised resources in society”. SE is a phenomenon in which people participate in a range of activities, including bartering, lending, renting, trading, exchanging and transporting (Möhlmann, 2015; Heo, 2016). Companies in the SE capture inactive resources (Frey et al., 2019) that are then shared or redistributed by consumers (Belezas & Daniel, 2023). The recirculation or redistribution of inactive resources allows people to launch new services or activities and enter new markets (Bernardi & Diamantini, 2018). Therefore, SE is a disruptive innovation that challenges traditional business models (Cohen & Kietzmann, 2014). In this redistribution of inactive resources, consumers exchange or share goods that would otherwise be discarded or left inactive, unused or underused (Martin, 2016; Frenken & Schor, 2017). The SE has always been seen as a sustainable model of production and consumption (Codagnone et al., 2016), as a promising path towards sustainable consumption (Meshulam et al., 2022). It is a post-property economy, where modern consumers value access to services more than ownership (Gazzola et al., 2021). By facilitating access to goods rather than their ownership, it is argued that net consumption is reduced (Belk, 2014; Seegebarth et al., 2016), reducing net production and improving material efficiency (Pouri, 2021; Meshulam et al., 2022), as well as providing other economic and social benefits (Hamari et al., 2016; Acquier et al., 2017; Laukkanen & Tura, 2020; Gazzola et al., 2021). This could reduce resource use and greenhouse gas emissions (Cherry & Pidgeon, 2018). Although sharing practices may exist in non-technological contexts, technology and platform mediation are crucial components of the ES phenomenon (Belezas & Daniel, 2023).*

This new pattern of consumption is profoundly changing consumer behaviour (Pushmann & Alt, 2016). Individuals around the world are beginning to rent, lend, trade, give away and share resources on an unprecedented scale (McAlpine, 2014). The SE enables individuals, organisations and societies to shape the way they live, connect and sustain themselves (Cheng, 2016), as it influences consumption habits by reducing ownership (de Leeuw & Gössling, 2016). Sensitivity towards a more sustainable lifestyle often emerges as one of the prerogatives of sharing users (Khan et al., 2020; Serrano et al., 2021). However, it also emerges that, in some contexts, sustainability is more of a positive side effect than a main topic (Hartl et al., 2018). The motivations that may drive consumers to adopt the SE can be diverse (Davidson et al., 2018). In addition to sustainability, consumers may be driven by economic motivation, which is often complemented by non-

² Sapienza University of Roma
e-mail: cecilia.grieco@uniroma1.it

economic drivers such as social relationships (Lee & Wong, 2021), social projection (Jain & Mishra, 2020), entertainment (Tsai et al., 2021) and anti-consumerism (Ek Styv-en & Mariani, 2020). Intention towards the SE is determined by individual characteristics and in particular age, environmental consciousness (Aguilera-Garcia et al., 2021; Hinojo et al., 2022), Internet and social network use (Hinojo et al., 2022). Enjoyment and economic benefits emerge as the key elements of satisfaction (Tussyadiah, 2016; Santoso & Nelloh, 2017).

However, the enthusiasm for this access-based pattern of consumption goes along with the awareness about the “dark side” of the SE (Curtis & Mont, 2020). From a social perspective, the spread of the SE may indeed generate discrimination (Malik & Wahaj, 2019), misbehaviour (Lambea, 2017), privacy issues (Lutz et al., 2018). In the context of tourism, SE services can generate overcrowding in cities, which could lead to the occurrence of non-civic behaviour such as noise, vandalism and violence (Lambea, 2017). The SE may also generate discrimination that may occur through sharing platforms (Edelman et al., 2017; Piracha et al., 2019): some social groups, such as the poor or elderly, may be excluded because they do not possess the necessary skills in the technological domain (Malik & Wahaj, 2019). Among the social impacts, there is also growing concern about data protection and personal privacy among users of sharing platforms (Lutz et al., 2018). From an economic perspective, the spread of the SE could generate an increase in the prices of other products and the demand for goods (e.g., clothing) and services (e.g., tourism); the increase in net consumption generates negative economic, social and environmental impacts (Retamal, 2017; Ma et al., 2018). In the context of tourism, for example, SE can generate gentrification and overcrowding in cities, leading to higher rental and property prices (Wachsmuth & Weisler, 2018). In addition to social and economic impacts, the environmental impacts of the SE are particularly discussed. Increased procurement may cause increased environmental pressures and resource exploitation (Tussyadiah & Pesonen, 2016; Hossain, 2020).

A specific typology of negative (and unwanted) effect is referred to as the “rebound effect”. The rebound effect was formalised in the aftermath of the energy crisis and thus became initially widespread in the energy economy (Meshulam et al., 2022; Vélez, 2023). Dütschke et al. (2018), in the context of energy conservation, state that the rebound effect occurs when an individual increases consumption of a good or service as a result of an increase in its efficiency: when the unit price of a good or service decreases due to an improvement in efficiency, people demand more of it. By increasing the demand for resources, rebound effects can be seen as a kind of negative spill over (Dütschke et al., 2018). According to Pouri (2021), the rebound effect occurs when greater resource efficiency is followed by an increase in demand, which consequently exceeds efficiencies. The rebound effect can be direct, when it occurs within the same system of resources or services, or indirect, when it occurs outside the same system of resources or services; in this case, the savings (including time and money) obtained from consuming an efficient service are spent on other consumption. From an economic point of view, therefore, the rebound effect is explained by the price savings due to improved efficiency that stimulates demand, leading to higher overall consumption (Meshulam et al., 2022). In addition to having economic foundations, the rebound effect also has psychological foundations. From this last point of view, the rebound effect could be explained by the theory of moral licence, i.e. the cognitive process through which individuals justify immoral behaviour by having previously engaged in moral behaviour, in the same or another domain (Dütschke et al., 2018). In other words, previous good deeds can make individuals free to behave immorally (Monin & Miller, 2001; Merritt et al., 2010). After remembering a previous good deed or performing one, individuals perceive that have permission to behave immorally or to engage in a dubious action (e.g., morally questionable behaviour) without fear of discrediting oneself (Blanken et al., 2015). According to Ottelin et al., (2017), the rebound effect can be analysed at two different levels: household level (micro-rebound) and economy wide (macro-rebound). While the latter refers to price reductions and transformational effects, the former are less challenging research objects, and they can be more easily captured.

In the SE domain, scholars focused their attention on the link between SE and sustainability, identifying the rebound effect as the increased consumption due to the exponential growth of sharing services which leads to a higher consumption, severely limiting the environmental benefits of the SE (Kurisu et al., 2021; Meshulam et al., 2022). This seems to happen mostly when consumers are not driven by environmental concerns, yet by economic and hedonistic reasons or for the accessibility offered by digital platforms. In the absence of pro-environmental awareness, the consumer is likely to spend the money saved to purchase other goods or services with a high environmental impact (Merino-Saum et al., 2023).

Despite the strong association between the two topics, the literature on SE and the rebound effect is not very extensive (Henry et al., 2021). Most of the studies deal with the negative environmental effects of SE, consider different sectors: Warmington-Lundström and Laurenti (2020) study online boat sharing; Makov and Font Vivanco (2018) study smartphone reuse; Wood et al. (2018) study the fashion industry, Meshulam et al. (2022) study the food industry. Therefore, most studies have focused on environmental rebound effects, taking little account of other undesirable effects of the SE (e.g. social, economic).

Purpose of the paper. A review of the literature shows that the SE is often associated with sustainable consumption (Curtis et al., 2019; Meshulam et al., 2022, Pérez-Pérez et al., 2023). However, in recent times, negative effects of this purchasing mode, such as the rebound effect, have been highlighted (Meshulam et al., 2022). The literature on SE and the rebound effect is not very extensive (Henry et al., 2021). There are few studies on the topic and all are recent (e.g. Warmington-Lundström & Laurenti, 2020; Pouri, 2021; Meshulam et al., 2022; Merino-Saum et al., 2023). Above all, the literature to date has often focused only on the environmental rebound effects of SE, but additional negative and rebound effects (e.g. social and economic) could be considered. It would thus seem that interest in the topic is raising in recent years, as a result of an increase in sharing practices. Basing on this premises, the purpose of this research is to shed light on the rebound effects that are associable with the SE, focusing on the household level. This emerges as a gap

in the stream of research about SE and consumer behaviour, that is currently receiving great attention, and for which extended knowledge has been called for (Grieco & Palagonia, 2024). Yet, despite some sparse efforts (e.g., Parguel et al., 2017), an investigation on the possible micro-rebound effect is currently missing. To meet this goal, the research aims to analyse extant literature and integrate it with a qualitative empirical investigation in order to answer the following research questions:

- (i) What are the typologies of rebound effects that could be associated with the use of SE services?
- (ii) How can they be framed and classified (e.g., industry, area of impact, direct/indirect, intensity)?
- (iii) How can they be captured and measured?

Methodology. Consistently with the purpose of the research and the nature of the research questions, an exploratory qualitative study has been considered the most suited approach. In particular, the qualitative focus group methodology was chosen. A focus group is, according to Lederman (1990), “a technique involving the use of in-depth group interviews in which participants are selected because they are a purposive, although not necessarily representative, sampling of a specific population, this group being ‘focused’ on a given topic”. Focus group participants are selected on the basis of having something to say on the topic (Rabiee, 2004). This technique for data collection allows to seize the tacit aspects and the subconscious influences of habitual practices because of the confrontational aspect that would risk being missed in the more traditional setting of individual interviews (Maréchal & Holzemer, 2018).

A series of focus group will then be conducted to better understand the rebound effect associable with the adoption of SE services. The number of participants will be defined taking into consideration the need to allow for emulation and for sufficiently long speaking time for participants (Muylaert et al., 2024). Thus, despite it will hamper representativity and generalization, small groups will be involved in the research. The participants will be selected ensuring their knowledge and use of SE platforms, across different typologies of shareable goods and services, that might lead to different types of effects (Pouri, 2021). Selecting participants with different usage habits will allow to identify those effects that pertain to the SE in general and those that are referable to specific sectors (e.g., fashion, food, mobility).

To ensure full understanding by participants, the topic of the research will be explained before starting the focus group. During the focus group, it would be necessary to investigate the consumer’s adoption of moral behaviour (buying through the SE) and to understand what values drive this choice (e.g., sustainability). The literature suggests that the rebound effect occurs when consumers do not approach the SE for environmental values, but for other reasons (e.g., low price) (Warmington-Lundström and Laurenti, 2020; Pouri, 2021). It would also be necessary to understand the amount of SE products purchased or the number of purchases in other categories to understand the presence or absence of a rebound effect (direct or indirect).

The focus groups will be divided into three main parts. In the first one, participants approach and use to the SE will be deepened, also collecting their impressions and consideration about this consumption practice. In the second, the possible negative effects will be explored, driving participants to reflect upon the side behavior they might adopt, consistently with the definition of rebound effect. In a third part possible proxies to capture and measure these effects will be discussed. If possible, the focus group will be conducted on site, and it will foresee moments with the overall group of participants and moments with sub-groups of users divided according to the specific industry they are more experienced of.

The analysis of the data collected through the focus groups and their interpretation will follow Krueger’s (1994) approach, which provides a series of clear steps to deal with the large quantity and complex nature of qualitative data. Each focus group will be recorded and transcribed in all of its parts, including the opening statements, the breaks, the guidelines. The transcripts will then be content analyzed through the use of codes that will be inductively derived from the collected data.

Results. As the research is ongoing, there are no results to be reported yet. Expected results include the identification and classification of possible rebound effect at consumer level that could be associated to the use of the SE within different industries. This would also allow to understand possible ways to measure these effects.

Research limitations. So far, the main limitations are referable to the proper identification of the boundaries of the research. In fact, the rebound effect needs to be clearly framed, especially against similar concepts such as spillovers, backfire, boomerang, reactance. A second area of severe limitation can be identified concerning the development of the focus group. This is because the object of the analysis pertains to behaviors participants might not be fully aware of, whose connection with the use of the SE needs to be precisely understood. Finally, concerning the focus group, the goal to identify the proxies to measure this effect could be hampered by the ability of participants to understand the task and the ability to the moderator to conduct the focus group. More widely, the qualitative investigations lack the possibility to generalize and compare achieved results due to the small number of involved people, thus more research will be necessary to confirm any findings, also from a quantitative point of view.

Managerial implications. For business managers, it might be relevant to understand consumer behaviour in relation to SE and the negative effects these behaviours might generate. Managers will also be able to measure the negative effects of the SE. In this way, it might be easier for managers to rethink their actions to limit and address the negative effects. Managers, noting consumer behaviour, might think, for instance, about acting internally to improve the business model and avoid rebound effects. Furthermore, managers might think about educating consumers on the correct use of SE. All this might be necessary to ensure that SE continues to be associated with sustainable consumption. This is also necessary

because among the reasons for consumer adoption of the SE is sustainability; if, in the future, consumers realise that it may be unsustainable, the SE companies may suffer possible negative consequences (e.g., loss of consumer trust).

Originality of the paper. *The research adds on the sub-field of research about SE consumers, for which more research is needed, even more concerning the end-users of SE platforms. It focuses on the so-called dark side of the SE, that is underdeveloped, and it raises the issue of rebound effects that happen at consumer level. In this way it aims to fill a gap that emerge in the literature, proposing the exploration of a topic whose deepening could benefit both scholars and managers.*

Greenwashing Temptation: A Critical Examination of the Legal Approach against Greenwashing

LUCIA GATTI¹ FEDERICA BUFFA² UMBERTO MARTINI³

Abstract

The role of green communication is pivotal today to demonstrate the company's commitment to sustainability. Corporate green communication is correlated to several positive effects which ultimately improve the firm's financial performance. However, all these benefits can be also attained by engaging in greenwashing. Following the recent conceptualization of CSR as a form of regulation incorporating voluntary and mandatory norms (Sheehy, 2015), current greenwashing literature emphasises the need to extend regulation about green communication as a solution to reduce greenwashing (legal approach). In line with this approach, political actors and governments are introducing regulations against greenwashing occurrences. By combining the self-love concept (Rocha & Ghoshal, 2006) with the phenomenon of greenwashing, this conceptual paper challenges the legal approach against greenwashing as the only solution to counteract the phenomenon. A new concept emerges from the conceptual analysis: the Greenwashing Temptation (GT). The GT concept allows to understand that not only greenwashing is a phenomenon embedded in the profit-driven principle, but also the legal approach to counteract greenwashing implicitly assumes the supremacy of the profit-driven motivation. Based on a discussion about the effects of anti-greenwashing regulations on the GT, we propose here a different avenue that could discourage greenwashing by challenging its foundational reason. Instead of creating financial disincentives, we call for the urgency of promoting ethical thinking in management and marketing studies.

Key words: *Greenwashing; Profit-driven principle; Business Ethics; Mandatory CSR, Green Marketing*

Framing of the research. *Businesses today face a growing pressure from regulatory bodies and civil society to embrace eco-friendly practices to mitigate their ecological footprint (Jiang et al., 2023). Within this scenario, the role of green marketing and communication is pivotal to demonstrate a company's commitment to sustainable practices. In the current era of eco-capitalism, green marketing is becoming a central topic in marketing studies (Groening et al., 2018) and the megatrend of sustainable consumption is critical to understand consumers today, especially Generation Z (Borah et al., 2024).*

Initiatives related to Corporate Social Responsibility (CSR) and green communication are emerging as critical sources of corporate legitimacy (Seele & Gatti, 2017). Corporate legitimacy in turn is correlated to several business advantages which may ultimately improve the financial performance of a company (Deephouse, 1999). Research also suggests that corporate green communication positively affect corporate reputation (Baum, 2012), consumers' purchase intentions and behaviours (Borah et al., 2024; Dekhili & Achabou, 2013; Spack et al., 2012) and their willingness to pay (Laroche et al., 2001), customer satisfaction and positive word-of-mouth (Gasbarro & Bonera, 2021).

However, all these benefits can be also attained by engaging in greenwashing, that is a form of "cosmetic communication" (Vollero, 2013, p.4). Indeed, green communication may improve firms' reputation and performance regardless of the actual company's green conduct (Seele & Gatti, 2017). This is why an increasing number of organizations today are "not walking the talk" (Walker & Wan, 2012), meaning they engage in greenwashing.

Over the last decades, the practice has grown enormously, and the techniques to greenwash are increasingly sophisticated (Gatti et al., 2019). The frequency of greenwashing-related scandals, the potential damages for organisations truly committed to the ecological transition, the high profile of the companies involved, and the effect on scepticism that greenwashing has on stakeholders' perceptions highlight the need for a comprehensive understanding of the phenomenon. In particular, it is essential to find how to detect and prevent this unethical practice (Montgomery et al., 2023).

To provide a deep understanding of the phenomenon and its implications, marketing and management scholars are increasingly addressing the topic in their studies. The academic literature related to greenwashing is currently booming, with more than 3.393 articles retrieved from ABI/Inform ProQuest database mentioning “greenwashing” or “greenwash”⁴. A longitudinal analysis of publications about greenwashing shows a constant increase in scholarly articles. In particular, from 2008 there has been a significant growth of papers on the topic (Gatti et al., 2019). The recent Montgomery et al. (2023)’s literature review reveals the ongoing interest in this area of research, with about 50 management papers about greenwashing in 2005, 100 in 2011 and more than 500 in 2021.

Greenwashing-related research has extensively discussed definitions of the concept, as well as several classifications of greenwashing typologies and techniques. Drivers and consequences of greenwashing have been also addressed in literature (e.g. Vollero, 2013), with several empirical studies measuring greenwashing effects on stakeholders, especially in B2C contexts (Gatti et al., 2019; Montgomery et al., 2023).

However, as claimed by Montgomery et al (2023), there is an urgent need to gain insight into how to prevent or disincentivize the practice. Following the recent conceptualization of CSR as a form of regulation incorporating voluntary and mandatory norms (Sheehy, 2015), some scholars emphasise the need to extend regulation about green communication as a solution to reduce greenwashing (e.g. Delmas & Burbano, 2011). In line with this approach, political actors and governments are introducing regulations against greenwashing occurrences (e.g. Guides for the Use of Environmental Marketing Claims (Green Guides) in US, the French Climate and Resilience Law (2023), The Greenwashing Law Council of Australia (2023)). The next chapter discusses the legal approach to counteract greenwashing, presenting the status-quo of EU regulations against greenwashing.

The legal approach to counteract greenwashing. One of the most widely accepted definitions of greenwashing defines it as “disinformation disseminated by an organization so as to present an environmentally responsible public image” (Concise Oxford English Dictionary, 10th edition). Some academics consider greenwashing as synonymous with false green communication. Other scholars, however, claim that greenwashing also indicate corporate green claims lacking validation from third-party certifications. According to this perspective, greenwashing refers to “making claims that are neither substantiated by a credible third-party certification nor by evidence” (Alves, 2009). An alternative approach proposes that greenwashing is the strategic selection of positive information regarding corporate environmental characteristics or behaviors, combined with the obscuration or the minimizing of negative issues. The selective perspective looks at greenwashing as a tactic to create a favorable environmental image by avoiding the communication of unsustainable practices, while promoting the corporate engagement into pro-green activities. The discrepancy approach expands this view by considering the discrepancy between the corporate environmental performance and its communication. Therefore, this perspective assumes that engaging in greenwashing corresponds to “not walking the talk” (Walker & Wan, 2012). Regardless of the different conceptualizations and definitions discussed in literature, there is a general agreement about the association between greenwashing and disinformation. In addition, research on the field suggest that greenwashing must be intentional to be classified as such (Mitchell & Ramey, 2010). Therefore, “genuine” greenwashing is always characterized by intent (Seele & Gatti, 2017).

For years greenwashing has been discussed in literature as an ethical issue as the misleading communication happens in a legal grey zone and depends on the eye-of-the-beholder (Giesler & Veresiu, 2014; Seele & Gatti, 2017). However, following the recent new conceptualization of CSR as a legal entity (e.g. Cominetti & Seele, 2016; Gatti et al., 2019; Sheehy, 2015), greenwashing is entering the political and legal fields. The theorization of greenwashing as a legal matter has been proposed as the solution to the problem about how to reduce and disincentivize greenwashing occurrences (e.g. Delmas & Burbano, 2011).

The evolution of the CSR concept towards an integration of voluntary and mandatory aspects has affected green communication and greenwashing in several ways. Political authorities today play a critical role in influencing green practices and green communication. In particular, in relation to green communication it’s not just that governmental entities have the authority to sanction misleading environmental claims under existing corporate laws, they also increasingly dictate the timing and manner in which companies communicate their ecological initiatives. There is a clear movement towards a more active governmental participation in the realms of green disclosure. For instance, since 2014 the EU legislation requires large and publicly listed companies to regularly publish reports detailing the social and environmental challenges they face, as well as the effects of their business activities on the society and the environment. The Eu regulation has become even more strict since January 2023, with the introduction of the new Corporate Sustainability Reporting Directive (CSRD). The Directive, set to affect reports published in 2025 for the fiscal year 2024, mandates companies covered by the CSRD to adhere to the European Sustainability Reporting Standards (ESRS) developed by the European Financial Reporting Advisory Group (EFRAG).

As clarified by the aforementioned example, today companies must comply with several regulations and standards. The rules of the game are changing. Green communication, and so greenwashing, are increasingly becoming a legal issue, dealing also with accounting and law and not just with management and marketing. To understand the level of evolution of greenwashing-related jurisdictions, in the next section we briefly summarize the main norms against greenwashing developed in EU. This constitutes an example of the development of greenwashing regulations. It is important to note here that a similar trend towards a strict anti-greenwashing regulation is observable in several other countries and nations all over the world (e.g. US, Australia, UK).

EU regulations against greenwashing. *The European Commission has developed two main proposals to address corporate greenwashing: the “Proposal for a Directive on empowering consumers for the green transition and annex” (called the Green Transition Proposal) and the “Proposal for a Directive on substantiation and communication of explicit environmental claims” (called the Green Claims Directive). By combining and revising the Unfair Commercial Practices Directive (UCPD) and the Consumer Rights Directive, The Green Transition Proposal, introduced in March 2022, emphasises and strengthens regulations concerning environmental claims. This proposal introduces new categories and instances to the list of green communication practices that are considered deceptive or misleading. This list is in line with some greenwashing categorizations discussed in marketing and management literature (de Freitas Netto et al, 2020) and reflects some of the well-known seven sins of greenwashing developed by the environmental consultancy Terrachoice (later acquired by UL) in 2007. However, what is particularly interesting here is that these categories of greenwashing are becoming a legal subject. Following the recent trend of CSR towards the inclusion of mandatory and legal aspects, greenwashing as well is entering the legal sphere.*

The Green Claims Directive, published in March 2023, represents the other significant initiative of the European Commission aimed at addressing the issue of greenwashing within the EU. This directive requires companies within the EU to provide substantiated and verifiable proofs about any environmental-related claims or labels they voluntarily employ, such as “green”, “ecological”, “carbon neutral”, or “eco-friendly”. The directive also indicated one or more authoritative bodies in each EU member state to evaluate the adherence to specific green communication directives. To enforce adherence, it proposes penalties, including monetary fines, for those who fail to comply with regulations. In certain states, these penalties can amount to as much as four percent of a company’s annual total revenue.

The legal approach against greenwashing has been proposed in literature as the solution to reduce greenwashing practices. The absence of legislation and limited punitive measures, on the contrary, are considered drivers for greenwashing (Delmas & Burbano, 2011). Two main reasons support this approach. From one side legal initiatives may increase transparency and accountability of corporate green communication. The establishment of standards and regulations can act as a deterrent against greenwashing. Given the necessity to provide reliable data or evidence to support environmental claims, it becomes harder for companies to mislead the public and so to engage in greenwashing. From the other side, sanctions and fines, while providing a partial compensation to the victims of greenwashing, may also create an inhibitory effect which may discourage companies to engage in greenwashing (Sun & Zhang, 2019).

However, we suggest here that not only greenwashing seems to be favoured by the profit-driven principle, as we will discuss in the next chapter, but also the legal approach to contrast greenwashing intrinsically assumes that the only responsibility (or purpose) of business is to increase its profits. Indeed, by creating a financial incentive (or disincentive) to NOT engage in greenwashing, they assume the profit-driven principle as the most important guiding force of current decision-making processes.

The profit maximization logic behind greenwashing and the legal approach to counteract it. *In order to understand how the profit-maximization logic favours the diffusion of greenwashing, we need to clarify first why firms engage in green communication.*

One of the main reasons for companies to engage in green communication is to gain corporate legitimacy. Legitimacy is linked to several benefits, including enhanced access to resources, improve partnerships with other businesses, and the recruitment of a more effective and motivated workforce. According to management research, achieving corporate legitimacy can ultimately lead to better financial outcomes (Deephouse, 1999). In the current era of eco-capitalism green marketing and communication are therefore new sources of corporate legitimacy (Seele & Gatti, 2017).

However, all these benefits can be also attained by engaging in greenwashing. Following signalling theory, false or misleading environmental claims can alter stakeholder perceptions (to obtain legitimacy) for two main reasons, which must work together for greenwashing to be deemed effective. The first is the perceived benefits an organization gains by signalling a commitment to environmental issues, irrespective of the truth of such commitment. Given that green communication is positively correlated with increased perceived legitimacy, even companies with a poor environmental profile are incentivized to engage in green communication. The second reason is linked to the difficulty stakeholders have in distinguishing between authentic and merely symbolic environmental commitments. This difficulty is largely due to the information asymmetry that exists between the signaller (the company) and the receivers (its stakeholders) and the complex nature of scientific knowledge that underpins many environmental claims, making accurate interpretation by the general public challenging. Consequently, companies can misuse green communications as a way to falsely signal their commitment to the environment, thereby achieving pragmatic legitimacy. By attaining legitimacy through greenwashing, companies aim at increasing their profits. Therefore, the profit-driven principle, supported by many mainstream management theories, can be considered a driver of greenwashing, supporting the practice when it does not break the law.

What is particularly interesting, however, is that the legal approach against greenwashing, even if guided by the good intent to reduce such unethical practice, is responsible for perpetuating the same profit-driven logic. The effect of anti-greenwashing regulation goes into two directions: first it creates a cost disadvantage associated to greenwashing (fines). The existence of strict regulations increases the risk of being punished. Secondly, by regulating green communication it enhances the control on the consistency between corporate green activities and green communication. Even in this case, however, it creates a disincentive based on reducing the benefit of engaging in greenwashing. The costs of engaging in false or misleading green communication become too high compared to the financial benefit perceived by companies.

While the legal approach may indeed contribute to effectively reducing greenwashing occurrences, we suggest here that it supports the profit-driven logic and therefore, under some circumstances, it could backfire good management practices.

Therefore, instead of challenging greenwashing when it occurs or making too costly the practice, as the legal approach does, we stress the opportunity to challenge the profit-driven principle as the only motive guiding corporate decision-making processes (see also Pastore and Ugolini, 2020). As claimed in the next chapter, some best practices which challenge the profit-driven perspective have already emerged: greater attention from the enterprises to implementing environmental management practices and putting attention to social sustainability (De Giacomo & Frey, 2022), and an increased number of businesses involved in certification processes (i.e. B-Corp certification) (Hunter and De Girolamo, 2023).

A new framework to understand motivations behind corporate green engagement. While the profit-driven principle is able to explain the main reason behind greenwashing and why regulations are important to counteract this practice, a paradox does persist. While greenwashing is growing at an unprecedented level, several companies are engaged today to transform their approach to business in an attempt to integrate sustainability into their strategy. Certified B Corporations (B Corps) or purpose-driven companies are an example. B Corp is a certification provided by B Lab, a global non-profit organization, to those companies that meet rigorous standards of social and environmental performance, accountability, and transparency. The idea behind this approach is that business go beyond traditional profit-driven models, aiming to create a positive impact on society and the environment. Purpose-driven companies are companies engaged in finding “profitable solutions to the problems of people and the planet”. Profit is not an end in itself, but rather a means to address social and environmental challenges. The establishment and proliferation of B Corps and purpose-driven companies challenge the conventional view that assumes profit as the only driven principle of business success.

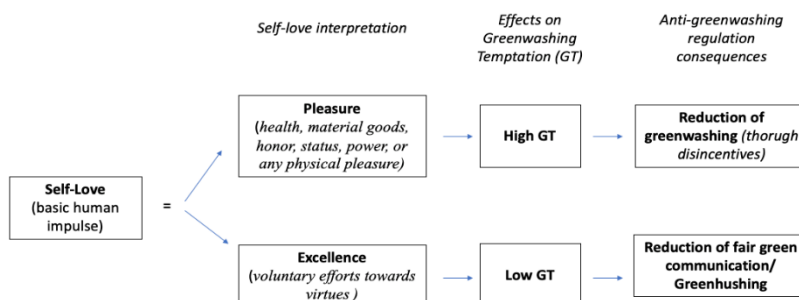

Not only good management practices challenge the self-interest model implied in the profit-driven principle, but also management literature has increasingly criticised the reductive nature of the self-interest model beyond the profit-maximization logic.

Management literature supporting motives other than self-interest has a long history, even if it has been relegated for years into marginal academic debates. Several examples of unselfishness in business have been discussed in literature, as individuals declining profitable deals they find unjust, or offering assistance to others without expecting anything in return (e.g. Elster, 1990; Frank, 1987). Even Adam Smith, often considered the father of the self-interest logic, refuses the reduction of human motivations to just self-interest. Even though in his *Wealth of Nations* Smith describes human actions as selfishness, he does not consider self-interest as the only motive for market exchanges, claiming that self-interest is moderated by an inner sense of justice (Smith & Cannan, 2003).

To address the limits of the profit maximization logic, in the last decades management scholars have proposed new concepts and theories integrating ethics into management studies. To this regard, an interesting contribution comes from Rocha and Ghoshal (2005) in their *Journal of Management Studies* article *Beyond Self-Interest Revisited*. They suggest a new framework to explain preferences, behaviours, and outcomes based on the concept of self-love, that is “the inclination of human beings to strive for their own good and perfection” (Aristotle, 1984; Aquinas, 1963). This framework integrates both self-interest and unselfishness motives into one perspective, therefore providing a valid interpretation to the coexistence of greenwashing cases and good corporate green practices. In line with Aristotle, Rocha and Ghoshal (2005) assume that the basic human tendency is toward good. However, human beings understand good in different ways: pleasure or excellence. Excellence results from voluntary efforts towards virtues and, according to Aristotle, it is the greatest of all the goods. Only excellence helps to develop the full human potential. True happiness is therefore attained when individuals cultivate their excellence, that is virtue.

Following the self-love framework (Rocha & Ghoshal, 2006), we suggest that both greenwashing and a fair corporate green engagement are motivated by the same basic human impulse towards good in general (self-love). Companies and managers engaged in greenwashing interpret “good” as “pleasure”, defined as a state attained through possessing health, material goods, honor, status, power, or any physical pleasure (Aristotle, 1984). The search for pleasure, which intricately assumes the self-interest as only motive, may guide human choices and behaviors in a personal life, as well as in management practices. However, following Aristotle, pleasure does not help individuals to reach happiness. Only excellence does.

Figure 1: The Greenwashing Temptation (GT) Framework

Based on our analysis, we develop a conceptual framework (Figure 1) introducing a new concept: the Greenwashing Temptation (GT). According to the Oxford Languages dictionary, a temptation indicates “the desire to do something, especially something wrong or unwise”. We therefore define Greenwashing Temptation as “the desire or propensity to do greenwashing”. By combining the GT with the self-love concept, the GT framework explains why some professionals consciously choose to not engage in greenwashing even when they perceive an economic advantage in doing so and the law does not forbid it. These individuals, motivated by a sense of moral duty or virtue ethics (self-love/excellence), may resist engaging in greenwashing (because they perceive a low GT) and instead prioritize transparent and truthful communication with their stakeholders. The GT framework also allows to understand the different effects of anti-greenwashing regulations on counteracting the practice. While in the cases of high GT, the legal approach may discourage greenwashing, in cases when GT is low, the legal approach may inhibit good management practices and/or encouraging greenhushing phenomena (Galli et al. 2023). Therefore, in these cases (low GT), we suggest that a different avenue to counteract greenwashing is necessary to promote good management practices.

Theoretical and Managerial Implications. Our conceptual analysis suggests that while establishing governmental regulatory frameworks may have a positive inhibitory effect on greenwashing practices, regulations alone cannot eradicate the Greenwashing Temptation. In addition, when GT is low, anti-greenwashing regulations may challenge good management practices. Indeed, our framework suggests that while the legal approach seems to be effective in discouraging greenwashing when GT is high, it does not promote fair green communication when GT is low. In cases when the motivation behind a corporate green engagement is value-driven (excellence), anti-greenwashing regulation may inhibit corporate green communication because it is not perceived as something beyond the law, therefore it does not allow to reach excellence. Given that green communication is becoming something to conform to (not “a voluntary effort towards virtues”), good companies may decide to be silence about it, thus engaging in greenhushing.

Based on the discussion about the effects of anti-greenwashing regulations on GT, we propose here a different avenue that could discourage greenwashing by challenging its foundational reason. Instead of creating financial disincentives, we call for the urgency of promoting an ethical approach in management and marketing studies. Scholars in the field should adopt a more comprehensive approach, where environmental and social concerns are integrated into the ultimate purpose of businesses. Putting ethical thinking at the core of management education would not eradicate greenwashing, given that, according to self-love theory, managers could always decide to focus on “pleasure” instead of “excellence”. However, as claimed by Ghoshal (2005), if we wish our students to contribute to building “delightful organizations”, we will have to teach them theories that describe how they can do so.

Limitations of the Study. This short paper is a work-in-progress conceptual paper. The paper needs to elaborate further the “ethical approach” proposed as an alternative avenue to counteract greenwashing. Additional theoretical frameworks could be integrated into the discussion to support the formulation of the new concept of GT. For instance, the literature of motivating principle for CSR is particularly relevant in this context. To this regards, Maignan and Ralston (2002) identify different principles discussed in CSR communication as driving forces of corporate commitment to CSR: performance-driven and value-driven. The two concepts could be related to excellence and pleasure, and they could be integrated into the GT framework.

The paper should also expand the discussion about the philosophical assumptions behind the self-interest view (*homo economicus*) and the profit maximization logic to better support the establishment of the self-love concept as a more comprehensive approach to understand human behaviors in management. In addition, to understand consequences of anti-greenwashing regulations in case of low vs high GT, empirical research is needed. The concept of GT should be therefore operationalized to test its effects in greenwashing-related phenomena.
